In the absence of Mr. Fry, an interesting paper on this subject was read on his behalf by the Rev. W. Wilks. The essayist commenced his paper with an interesting historical sketch of the Fuchsia, which was first introduced to this country about 1746, from Chili, by a sailor. The plant was exhibited in the window of his mother's house, and whilst there attracted considerable attention from an individual who communicated the fact to Mr. Lee, a nurseryman at Hammersmith, who, after much trouble, succeeded in obtaining the novelty for 80 guineas, which was afterwards called, but improperly, *F. coccinea*. In 1830 the first English hybrid was raised, and from that year (and especially after 1840) new hybrids were frequently distributed.

In 1855 the first varieties with white corollas were distributed by Henderson, but how they were obtained must ever remain a mystery, as the raiser (Mr. Storrey, of Newton Abbot), died about the time his plants were being distributed, without leaving any particulars respecting them. Mr. Fry then went on to describe the beautiful specimens that were grown as early as 1843, some of which were under his charge, and were about 14 feet high. He thought that the unpopularity of the Fuchsia at the present time was partly due to the very different style of horticultural buildings which obtain now, and in which it was extremely difficult to find room for large specimen plants. But the lecturer dwelt upon the fact that room might and ought to be afforded for dwarf plants, which can be raised and brought to perfection in about six or eight months.

Mr. Fry said that although some of the best varieties had been obtained solely by bee-fertilisation, if advances were to be made and certain peculiarities to be developed, it was imperative that they should be fertilised by the cultivator, and all other chance of pollination be guarded against. The seed, which should be thoroughly matured, should be carefully taken from the pulp and dried, so that they may be stored away until about February, when they may be sown thinly in shallow pans or boxes (which should be well perforated), and carefully labelled as to pedigree, &c. Cover them very thinly with fine mould, and place some sheets

of glass over them, covering the whole with tissue. They will appear in about fourteen to twenty-one days, when the glass and paper should be taken off. When they are large enough to handle they are pricked off into pots, and when about an inch high are put singly into small pots, using very light soil. As soon as they are nicely rooted they are shifted into 3-inch pots, and placed on a shelf in the greenhouse. They should then be moved on as they require, and will commence to bloom when they are five or 6 months old. Mr. Fry had always longed to raise a perfectly white Fuchsia, and had failed; but he had been greatly pleased that Mr. Cocker of Aberdeen had been more successful, and had raised Countess of Aberdeen, which was admirable in all respects. Although its growth was rather weak, it could be grown into specimen plants under proper treatment, and included in this was the requisite amount of shading.

Propagation.—As soon as the shoots were of sufficient length they should be taken off, and put into a compost of loam, leaf-mould, and sand; or they would strike easily, and more quickly, if put into cocoa-nut fibre. When struck, they should be potted singly into small pots, and afterwards into 4-inch, and larger as they may require. The best soil was the top spit from meadow-land, with some sharp silver sand, to which, if the loam be heavy, a little fibrous peat ought to be added. When potting into the larger pots, Mr. Fry advised a little soot and dry cow-mannure to be added. The compost was to be moist, but not wet, at the time of using, and the plants were to have a thorough watering before potting, and they would then be best if not watered until two or three days after the operation. A high temperature was disastrous to Fuchsias, and the lecturer recommended a temperature of from 50° to 75° as being most conducive to success.

Mr. Fry then spoke of the adaptability of the Fuchsia as a bedding plant, and of the pretty effect produced by planting those with white corollas on a groundwork of Lobelia, and the coloured ones on a bed of Mesembryanthemums; concluding by appealing to compilers of schedules to give more encouragement to the growth and exhibition of this floral gem.

SOUTHPORT AND BIRKDALE HORTICULTURAL.

JULY 28.—Shortly after noon on this date, the eleventh annual exhibition of the above society was opened in the private grounds of the Mayor. The ground was in every way adapted to the purposes of the show. Two large marquees had been erected beneath the trees in the grounds. The larger of the two tents contained the exhibits of the gentlemen's gardeners, whilst the smaller held the cottagers' and amateurs' exhibits, and some large Ferns and Fuchsias shown by gentlemen's gardeners. The tent space was abundant for all requirements, and the staging and arranging of the exhibits had been done with a view to displaying the same to the best advantage. The plants of the larger varieties were ranged up the centres of the tents, whilst the smaller varieties of exhibits were placed round the interior of the canvas. The principal judges were Mr. Andrew Jamieson Neston, Cheshire; Mr. J. Hathaway, gr. to the Earl of Lathom, and Mr. J. Wilson, gr. to Mr. J. Reynolds, West Derby, Liverpool. Mr. Frederick Bull, curator at the Churchtown Botanic Gardens, and Mr. Henry Woodhall, assisted by judging the cottage front gardens. The classes numbered 122, and the exhibits, which were of a comprehensive nature, included plants, fruits, cut flowers, vegetables, "groups." Speaking generally of the show, it might be said that the plants and fruits were of a better class than hitherto, showing a decided improvement in the growing and cultivation all round. A distinctly better strain was noticeable amongst Begonias and similar classes of plants than was ever seen at the society's shows before. The miscellaneous groups of plants were scarcely up to the average of previous years. The groups exhibited this year were fairly good, but lacked colour somewhat; but the unfavourable season is to account to some extent for this drawback to the groups exhibited. In the class for six stove or greenhouse plants there was a keen competition, and quality reigned supreme throughout. Much difficulty was experienced by the judges in deciding upon the respective merits of the exhibits in the class for stove and greenhouse plants. The Ferns made up a magnificent display, and with one or two isolated exceptions were of a splendid description. A high quality prevailed amongst the hardy Ferns.

SOUTHAMPTON HORTICULTURAL.

JULY 30 AND AUGUST 1.—This annual exhibition was, as usual, held in the Society's grounds, Westwood Park, on the above dates, and was a really good show. There was a slight falling off in the number of specimen stove and greenhouse plants, still there was ample material to create a fine display.

Mr. F. Jennings, gr. to W. Garton, Esq., Woolston, Southampton, was the principal exhibitor in specimen plants, securing leading honours with well-grown and freely-flowered plants. Mr. Amys, gr. to the Hon. Mrs. Elliott Yorke, Hamble Cliff, was also a successful exhibitor in the plant classes. Mr. E. Wills, florist, Winchester Road, Shirley, Southampton, also exhibited in many of the plant classes with success.

Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood House, Henstridge, Blandford, won the premier award in the class for miscellaneous groups of plants arranged for effect, with a commendable arrangement. Mr. Jennings won for six specimen Ferns, with exceedingly well-grown examples. Mr. Blandford, gr. to Mrs. Haselfoot, Moorhill, Bitterne, won in the class for a collection of Orchids, staging a nice lot of choice kinds; Mr. E. Carr, gr. to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke, 2nd. Fuchsias, Coleus, Begonias, Pelargoniums, hardy Ferns and plants suitable for table decoration were all creditably shown.

Cut flowers were contributed in large numbers in their respective classes. Messrs. Keynes, Williams & Co., Salisbury, won in the open classes for Roses, show and Pompon Dahlias. Mr. Pritchard, Southborne Nurseries, Christchurch, won for herbaceous flowers. Mr. Budd, gr. to F. Dalgety, Esq., secured the leading award for stove and greenhouse flowers. Mr. E. C. Goble, Ryde, Isle of Wight, and Mr. Pubbeck, staged good Carnations and Picotees. Mr. Chard, Brunswick Nursery, Stoke Newington, won 1st prize for table decoration; and so he did for both ball and bridal bouquets, with exhibits quite up to his best style.

Fruit was plentiful and good. Mr. Inglefield, gr. to Sir J. Kelk, Tedworth, Marlborough, won easily for six dishes, staging good produce. Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Wickham, won first honours for three bunches of black and three bunches of white Grapes, and also for one bunch black and one white, with good examples of Black Hamburg and Muscat Alexandria, also Silver Medal for one bunch of the last-named kind. Mr. Inglefield led for a dish of Nectarines, a like honour falling to Mr. N. Molyneux for Peaches. Melons were a strong class: Mr. Ward, gr. to the Earl of Radnor, Longford Castle, won with a very fine Hero of Lockinge in the green class. Mr. Maxim, gr. to the Hon. Miss Shaw Lefevre, Heckfield, in the scarlet-flesh section, with Sutton's A1. Mr. West, gr. to J. R. Wigram, Esq., had the best hardy fruit in six dishes. A capital lot of vegetables were staged in larger number, and of better quality, than we have before seen them, even at Southampton. In the open class for nine varieties, Mr. Pope, gr. to the Earl of Carnarvon, Highclere Castle, Newbury, won rather easily, and so he did in the class for six kinds; prizes, given by Messrs. Webb. For Messrs. Sutton's prizes Mr. Waite, gr. to Colonel the Hon. W. P. Talbot, Glenhurst, Esher, was the most successful.

For *Bougainvillea glabra* "Wills" variety was awarded a First-class Certificate, exhibited by Mr. Wills, which has smaller flowers with a distinct purple shade; plants in 48-sized pots, flowering freely. A like distinction was given to *Anthurium Sanderianum* exhibited by Mr. F. Sander, St. Albans.

Certificates of Merit were awarded to Mr. B. Ladhams, Shirley, for an extensive exhibit of hardy cut flowers; and to Mr. Chard, for floral arch; and to Messrs. G. Bunyard & Co., for collection of Gooseberries, Raspberries, and handsome fruits of Lady Sudeley Apple, showing the wonderful colour of this variety when grown under favourable conditions.

NORTHAMPTON HORTICULTURAL.

AUGUST 1.—The above Society held its eleventh annual show on Bank Holiday at Delapre Park, a capital site for holding a show of such magnitude. The competition in most classes was good. The principal class for twelve stove or greenhouse plants was won by Mr. J. Cypher, Cheltenham, with magnificent specimens of the following:—*Erica Thompsonii*, *Croton angustifolius*, *Croton Sunset*, *Latania borbonica*, *Ixora coccinea*, *Kentia australis*, *Erica tricolor vera*, *Phenacoma prolifera*, *Stephanotis*

floribunda, *Cycas revoluta*, and *Kentia Fosteriana*; Mr. Finch, gr. to J. Marriott, Esq., Coventry, closely followed for 2nd honours, his best plants being *Croton Johannis*, *Ixora Fraserii*, *Bougainvillea glabra*, and *Sobralia macrantha*; this latter was an exceedingly fine plant, and was awarded the *Gardeners' Magazine* Medal for high cultivation.

For six stove or greenhouse plants, the competition was also good. Mr. Lanchbury, gr. to C. Watkin, Esq., Wellingborough, was well 1st, with creditable plants; 2nd, Mr. J. Holland, gr. to W. Jeffery, Esq., Cliftonville.

For a group of miscellaneous plants (open), Mr. J. Cypher was 1st, with a very light and graceful arrangement.

In the group confined to gardeners, the competition was very keen; 1st, Mr. Jeffery; 2nd, Mr. H. Tressler, gr. to M. P. Manfield, Esq., M.P.

Miscellaneous plants were also well shown, such as Ferns, Fuchsias, Begonias, and table plants. Cut flowers made a grand display.

For twenty-four Roses, the Rev. W. H. Jackson, Bedford, was 1st; Messrs. J. Perkins & Sons, Northampton, 2nd; and Messrs. T. Perkins & Sons, Northampton, 3rd. The Rev. W. H. Jackson being also 1st for twelve splendid specimens of Tea Roses.

Collections of fruit were poorly shown. 1st, Mr. S. Cale, gr. to Earl Spencer, Althorpe. Vegetables were a striking feature. Mr. W. Fyfe, gr. to Lord Wantage, took 1st honours in the principal classes, his collection of twelve in the open class approaching perfection, for they were staged with excellent taste; the sorts were Pea Autocrat, Beet Pragnell, Tomato Champion, Turnips Snowball, Cauliflower Autumn Giant, Cucumber Perfection, Green Globe Artichoke, Main Crop Onion, Potato Snowdrop, Carrot Matchless, Celery Standard Bearer, and Canadian Dwarf Bean. Mr. J. Kightley, gr. to Sir Hereward Wake, Bt., was a good 2nd.

The competition in the amateur and cottagers' classes still maintained the high reputation it has gained at previous exhibitions. Honorary exhibits were largely and well shown by Messrs. J. Perkins & Sons, and by Messrs. T. Perkins & Sons, both of Northampton.

MIDLAND COUNTIES CARNATION AND PICOTEE.

AUGUST 6.—The second annual exhibition at the Elgbaston Botanic Gardens on the above date was most satisfactory; a fine day, good arrangements, and a large number of blooms, and leading exhibitors, but in the north they are so late that growers could not stage a flower.

Mr. Robert Sydenham was 1st for twelve Carnations; 2nd, Mr. Dodwell; 3rd, Messrs. Thomson.

Twelve Picotees: 1st, Mr. C. Turner; 2nd, Mr. Lakin; 3rd, Mr. Dodwell.

The classes for six Carnations, as well as for six Picotees, were both well filled, and for twelve yellow ground or fancy varieties there was a fine lot staged; 1st, Mr. Turner; 2nd, Mr. Dodwell; 3rd, Messrs. Thomson. For twelve self Carnations, a capital lot altogether, 1st, Mr. Turner; 2nd, Mr. Dodwell; 3rd, Mr. Sydenham.

The other classes were also well-filled, and a large number of blooms were staged in the single bloom classes. Prizes were offered for border Carnations in bunches, and a good display was made, and were much admired. Baskets and bouquets of Roses were very effective.

Several new flowers received First-class Certificates:—

To Mr. Charles Turner, for self Carnation Rose Unique and Rose Wynne; and Picotees Lady Emily Van de Weyer and Edith M. Wynne.

To Mr. J. Lakin, Oxford, for Picotees Ne Plus Ultra and Miss Lakin.

To Mr. J. Beale, Leicester, for Picotee Mrs. S. Beale. To Mr. J. P. Sharp, Birmingham, for Picotee Scarlet Queen.

To Messrs. Thomson & Co., Sparkhill Nurseries, for self Carnations Mrs. Joseph Chamberlain and Negress.

To Mr. J. Lamb, Barton Joyce, Notts, for fancy Picotee Duchess of Portland.

Amongst the newer kinds of Carnations staged, Dodwell's Othello and Dodwell's 1003, purple-flake; Chamdy's Guardsman, S.F., and Chamdy's Gilbert, S.F., are very fine.

In Picotees, many new varieties of fancies and yellow grounds, especially of great quality, were staged.

A large number of honorary exhibits were staged, and several Silver Medals awarded.

THE ALPINE GARDEN.

CAMPANULA WALDSTEINIANA.

Of the many alpine Campanulas suitable for growing on rockwork, none is neater or more flowery than this one. It is in flower all July, and being only a few inches high, and spreading but little at the base, it is easily overgrown if care is not taken about its surroundings. But with this care it becomes one of the most enduring of rock-plants, the first specimen I had of it having lived in the same spot for seven or eight years, and being still as thriving as ever. I have raised many seedlings from it, which vary considerably both in stature and in the size and shape of the bell. There is a closely-allied species which Reichenbach considers to be only a local variety of it, known as *C. Tommasiniana*. It certainly does not differ from it as much as native forms of *C. rotundifolia* differ from one another; but whether a species or a variety, it is not nearly so flowery, and its long narrow bells are less ornamental than those of the other. I think it would not be difficult to pick out a series from seedlings of *C. Waldsteiniana* connecting it with *C. Tommasiniana*. In raising seed it is necessary to take precautions against insects, as the seedlings are so minute that two or three woodlice will clear a whole crop in a night. *C. Wolley Dod, Edge Hall, Malpas.*

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

RUTHENICUS.—Will any reader kindly inform me what country the adjective Ruthenicus, which I take to be a geographical epithet of certain plants (e.g. *Centaurea ruthenica*) refers to? I do not ask before exhausting the resources of several geographical dictionaries and atlases. It seems to be somewhere in eastern Europe [Russia], and is spoken of by De Candolle, *Prodromus*, vol. vi., p. 566, as *Ager Ruthenus*. *C. Wolley Dod, Edge Hall, Malpas.*

ASSESSMENT.—I have built a greenhouse for growing Tomatos 100 ft. long by 20 ft. wide, 3 ft. from ground to eaves, about 12 ft. to ridge, on wooden posts 3 ft. in the ground, and about 3 ft. above, and boarded 3 ft. up to eaves with about 1 inch boards by 7-inch. It is built on my own land, but the land is mortgaged. The overseers of the parish want to assess it, and we could not agree upon the value of the place. A grower near this parish who has several houses of the same class is not assessed at all, and he maintains the overseers could not assess that class of house, as it was built for a shelter, and came under the same class as a hedge, &c., in a market garden. The collector cannot see that, for if I was letting the place, it would let for more money than it otherwise would have done, and the properties were assessed by the rateable value. Can anyone please advise me on this matter as to whether they can assess me at all; and if so, how much? *G. D.*

HORSE-PLUM.—Will anyone tell me if they know a Plum called the Horse-Plum, and if so whether it is an English or an American variety? *Prunus.*

Obituary.

THOMAS C. THYNE.—The death of Mr. Thomas Crawford Thyne, partner of the firm of Messrs. Thyne Bros., nurserymen, Indooroopilly, Brisbane, took place on April 11. Mr. Thyne served his apprenticeship with John Stewart & Sons, nurserymen, Dundee; afterwards was in the propagating department of James Dickson & Sons, of Chester; later received the appointment to take charge of a section of the glasshouses in the nurseries of Hugh Low & Co., of Clapton. In 1888 he left the nursery-work to assist his father in the seed business in Dundee. In the summer of 1889 he contracted a severe illness. His medical adviser recommended him to take a trip to the Colonies. He decided to go to Queensland, where his brother, Mr. A. S. Thyne, was already located. In the latter part of 1890, the two brothers commenced work at Indooroopilly as nurserymen. After the hard work and difficulties contingent upon the formation of an entirely new business, success seemed to be just within the grasp of the enterprising brothers, when death overtook Mr. T. C. Thyne, at the early age of twenty-six years.

FIG. 33.—SPECIMEN FUCHSIA (ARABELLA). (SEE P. 192.)

AZALEA "HEXE."—Mr. Otto Forster, writing in the *Garden of the 6th Inst.*, says with reference to this plant:—"Many years ago I was accidentally present at Messrs. Standish & Noble's when a box of Mr. Fortune's arrived. This contained, amongst other interesting novelties, plants of *Azalea amœna*. One of these plants was carefully cultivated in my garden when I was at Augsburg, and pollen of a very vigorous flower, which showed the *Hose-in-hose* character very distinctly, was in 1878 transferred to *Azalea Herzog Adolf von Nassau*. *Azalea Hexe* is the result thereof. It partakes of the *Hose-in-hose* character of *amœna* in a very pronounced way, and is in colour intermediate between both parents. *A. Hexe*, as I can state after several years' careful trial, has many good qualities. It is a very free flowerer (often three buds on the end of a single shoot), forces well and early, the growth of the plant is vigorous, and the colour of the flowers, even when forced early, a very lively rosy-purple. The compact trusses are very useful as button-hole flowers, as these remain an unusually long time fresh when cut nearly a month from the plant. *Hexe* has already a numerous progeny, as I crossed it with *A. linearifolia* (the female parent). Many of the seedlings are *Hose-in-hose*, and all are agreeably fragrant; they grow very vigorously and the flowers are borne in clusters, but none has the small elegant foliage of the female plant, as I had anticipated."

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—
0, Scotland, N. Principal Wheat-producing Districts—
1, Scotland, E.; 2, England, N.E.; 3, England, E.;
4, Midland Counties; 5, England, S.
Principal Grazing, &c., Districts—6, Scotland, W.; 7,
England, N.W.; 8, England, S.W.; 9, Ireland, N.;
10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending August 6, is furnished from the Meteorological Office:—

"The weather during this week was moderately fair; very little rain fell over the greater part of England, but in Ireland and most parts of Scotland the sky was generally cloudy, and rain, though not heavy, was of rather frequent occurrence.

"The temperature was, a little above the mean in 'Ireland, S.,' and equalled the mean in several of

the other western districts, but in all the 'Wheat producing' districts and in 'England, N.W.' it was below; the deficit being as much as 4° in 'England, E.' The highest of the maxima were recorded either on July 31 or August 6, and ranged from 77° in 'England, S. and S.W.,' to 69° in the 'Channel Islands,' and to 68° in 'Scotland, W.' and 'England, N.W.' The absolute minima, which were recorded very generally during the night of the 4th and 5th, were very low for the time of year; in 'England, S.W.' (at Llandovery), the sheltered thermometer fell to 35°; in 'England, S.' (at Strathfield Turgiss) to 37°; in 'England, E.,' the 'Midland Counties,' and 'Ireland, N.,' to 38°; and in most other districts to between 41° and 43°. In 'England, N.E.,' however, the lowest temperature was 46°; in 'Ireland, S.,' 47°; and in the 'Channel Islands,' 50°.

"The rainfall exceeded the mean in 'Scotland, N.,' but in all other districts there was a deficit, and in the east and south of England the fall was very slight.

"The bright sunshine was less prevalent than during the preceding week in all districts excepting the Channel Islands, and in all but a few cases it was below the mean. The percentage of the possible amount ranged from 19 in 'Ireland, S.,' to 20 in 'Scotland, N.,' and 23 in 'England, N.E.' and 'Ireland, N.,' to 41 in 'England, S.W.,' 42 in 'England, S.' and 'Scotland, W.,' and to 63 in the Channel Islands."

MARKETS.

COVENT GARDEN, August 11.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

BUSINESS very tame, and prices have suffered accordingly. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: Aug. 10.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that *Tritolium* is in improved request at higher rates; supplies both of French and English are very narrow compass, and command an advance of 2s. per cwt. Samples of new Rapeseed, Rye, and Tares, are coming to hand. Canary seed is strong at its recent phenomenal rise. Smyrna cablegrains just received quote 77s. per qr. There is no change in Buckwheat, Hemp, or Linseed. Blue Peas and Haricot Beans keep steady. The Board of Trade Returns give the imports of Clovers and grass seeds for last month into the United Kingdom as 4127 cwt., value £8416, as against 2648 cwt., value £4076, for the corresponding period of 1891.

FRUITS AND VEGETABLES.

BOROUGH: Aug. 9.—Quotations:—Cabbages, 3s. to 4s.; Marrows, 4s. to 5s. per tally; Scarlet Beans, 2s. 6d. to 3s. 6d.; Peas, 2s. per bushel; Carrots, 3s. 6d. to 4s.; Turnips, 2s. 6d. to 3s.; Parsley, 2s.; Spring Onions, 4s. to 6s. per dozen bunches; Egyptian do., 3s. 6d. to 6s. per cwt.; English Apples, 3s. per bushel.

SPITALFIELDS: Aug. 9.—Quotations:—English Apples, 2s. 9d. to 6s. 6d. per bushel; foreign Tomatoes, 9d. to 1s. 2d. per box; Gooseberries, 2s. to 3s. 6d.; black Currants, 4s. to 5s.; red do., 2s. 6d. to 3s.; black Cherries, 2s. 9d. to 4s.; Orleans Plums, 4s. 6d. to 6s. per half-sieve; Raspberries, 3d. to 4d. per 1 lb. punnet; fresh Green Gages, 4s. to 4s. 6d. per box; Seakale, 9d. to 1s. 6d. per punnet; Cabbages, 2s. 9d. to 5s. per tally; Spinach, 1s. 6d. to 2s.; French Beans, 2s. to 3s. 6d.; Scarlet do., 3s. to 4s.; Broad do., 1s. 6d. to 2s.; Peas, 2s. to 2s. 6d. per bushel; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 1s. 6d. to 2s. 6d.; Spring Onions, 3s. 6d. to 4s. 6d.; Parsley, 1s. to 1s. 9d. per dozen bunches; Cauliflowers, 1s. to 2s. 6d.; Cabbage Lettuce, 3d. to 6d.; Leeks, 2s. to 2s. 6d.; Vegetable Marrows, 1s. to 1s. 6d.; frame Cucumbers, 1s. 6d. to 2s.; natural do., 9d. to 10d.; Broccoli, 3d. to 4d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Cos Lettuce, 4d. to 8d. per score; Horseradish, 1s. to 1s. 2d. per bundle.

STRATFORD: Aug. 9.—There has been an excellent supply of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 4s. to 5s. per tally; Cauliflowers, 1s. 6d. to 2s. 6d. per dozen; Turnips, 1s. 6d. to 3s. per dozen bunches; Mangels, 20s. to 30s. per ton; Beans, 3s. to 3s. 6d. per sieve; Peas, 5s. to 5s. 6d. per bag; Onions, English, 2s. 3d. to 3s. per dozen bunches; Egyptian, 3s. to 3s. 6d. per bag; Apples, English, 4s. to 6s. per bushel.

FARRINGTON: Aug. 11.—Quotations:—English Apples, 4s. per bushel; Gooseberries, 2s. per half-bushel; Grapes (Denia), 4d. per lb.; Currants, red, 3s. 6d. per half-bushel; do., black, 5s. do.; Cherries, black, 4s. per peck; do., 3s. 6d. per 24 lb.; cooking Apples, 4s. 6d. per bushel of 48 lb.; Caroon Cherries, 5s. 6d. to 6s. per bushel; Turnips, 2s. per dozen large bunches.

POTATOS.

BOROUGH, Aug. 9.—Quotations:—English Early Rose, 60s.; Hebrons, 60s. to 65s.; Snowdrops, 70s. to 90s. per ton.

SPITALFIELDS: Aug. 9.—Quotations:—Myatt's Kidneys, 55s. to 65s.; Sutton's Regents, 60s. to 65s.; Imperators, 60s. to 70s.; Hebrons, 60s. to 75s.; Early Rose, 55s. to 65s.; Sutton's Abundance, 60s. to 65s.; Snowdrops, 60s. to 80s. per ton.

STRATFORD: August 9.—Quotations:—Hebrons, 60s. to 75s. White Elephants, 65s. to 75s.; Kidneys, 65s. to 70s.; Snowdrops, 70s. to 80s.; Regents, 65s. to 70s. per ton.

AVERAGE PRICES: London, August 10.—Snowdrops, 70s. to 90s.; Hebrons, 65s. to 80s.; Magnums, 65s. to 75s.; Kidneys, 65s. to 75s.; Early Rose, 60s. to 70s. per ton.

FARRINGTON: August 11.—Quotations:—Red Beauties, 70s. to 75s.; red do., 70s. to 75s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 110s.; do., inferior, 46s. to 75s.; Hay, best, 60s. to 108s.; do., inferior, 26s. to 50s.; and Straw, 20s. to 33s. per load.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending August 6, and for the corresponding period last year:—1892: Wheat, 39s. 7d.; Barley, 23s. 8d.; Oats, 21s. 6d. 1891: Wheat, 39s. 1d.; Barley, 26s. 4d.; Oats, 21s. 2d.

NOTICES TO CORRESPONDENTS.

PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

BOOKS: T. W. B. From Eyre & Spottiswoode, Government printers, East Harding Street, Fetter Lane, E.C.

CARNATION BEAUTY OF TONBRIDGE.—We are informed by Mr. F. Webber, of Tonbridge Nurseries, that he raised this variety, and exhibited it at the Drill Hall on the 26th ult.

GOOSEBERRIES: Upney.—Your Gooseberries are fairly good, but they are no improvement on existing varieties.

GRAPES: G. H. The roots are healthy, but what has caused the bunch to rot we do not know. Cut off the affected bunches at once. Prune hard-in when the leaves have fallen.—J. D. We believe the Grapes cracked, because at one period, they receive more water than they could utilise. There was a want of balance between supply and expenditure, that is transpiration, but how caused we cannot tell.—Epton. The Grapes sent are not affected with any disease, but have through some means or other, suffered a check. Anything that would produce a sudden check to growth would be followed by such results. We cannot identify variety, from those sent.

NAMES OF FRUITS: R. P. The Peach you forwarded was so badly packed, that it was merely a mass of pulp when it reached here. We are thus unable to say what it had been like.

NAMES OF PLANTS: J. M. (omitted last week) *Xylobium squaleus*.—R. Summers. 1, *Thalictrum angustifolium*; 2, *T. aquilegifolium*; 3, *Poterrum canadense*; 4, *Salvia pratensis*; 5, *Cirsium oreganum*; 6, *Celsia arcturus*; 7, *Thalictrum glaucum*; 8, *Sidalcea*.—H. M. G. 1, *Melampyrum arvense*; 2, *Stachys Betonica*; 3, *Ballota nigra*.—G. S. 1, *Epilobium angustifolium*; 2, double *Potentilla*; 3, *Dendrobium crystallinum*; 4, *Gymnogramma calomelanos*; the proliferous *Rose*, not uncommon.—K. J. G. 1, *Hymenocallis littoralis*; 2, *Hymenocallis fragrans*; 3, *Pellionia Daveana*; 4, *Sobralia macrantha*; 5, *Pentas carnea*; 6, we do not recognise from the leaf only; the *Chrysanthemums*, when received, appeared to be healthy and free from pest.—S. W. 1, *Lysimachia Nummularia*; 2, *Eryngium alpinum*; 3, *Echinops Ritro*; 4, *Eupatorium cannabinum*; 5, *Antennaria margaritacea*; 6, *Veratrum album*; 7, *Eccremocarpus scaber*; 8, *Umus campestris variegata*.—J. H. 1, *Alnus imperialis*; 2, *Liquidambar orientale*; 3, *Thalictrum*; 4, *Periploca græca*.—G. S. *Epidendrum fragrans*.—J. S., *Maidenhead*. *Phajus bicolor*.—L. C., *Rugby*. *Oncidium pulvinatum*.

PEACHES: R. H. M. We do not think the quassia chips would favour the fruit. The taste is of tannin not of quassia, and is probably due to deficient sun heat and light.

PETUNIA: J. T. Not at all uncommon.

SCHEDULE DRAFTING: Local Show. The wording of the schedule you refer to is much too vague, and allows of many interpretations. We are, however, of opinion that the judges were quite right in disqualifying an exhibit which included 12 varieties only. To interpret the schedule in such a manner might result in 12 varieties of Potatoes or other vegetable being staged.

TURNIP: J. V. W. The swellings are caused by a beetle, *Ceuthorhynchus sulcicollis*. Similar swellings are produced by a slime fungus, as in Cabbages.

WIRE: E. M. P. The wire is suitable, providing the trees are protected by a piece of hose or cork being placed between them and the wire.

COMMUNICATIONS RECEIVED.—Cochet, Suisses.—J. R.—E. C.—Frederick Roemer, Quedlinburg.—W. Max Cornu, Paris.—W. R.—A. R. E.—F. W. B.—Geology, Surrey, Canada.—J. H.—P. Fry (with thanks).—J. H. H., Trinidad.—W. F., Jamaica.—T. H.—J. E. E.—S. G.—H. E.—F. V. D.—J. R. J.—A. D.—Pisum.—R. D.—E. M.—W. A. C.—J. D.—A. D. W.—J. S.—W. M.—A. & N.—H. G.—M. H.—Deards (many thanks).

PHOTOGRAPH RECEIVED.—N. M. S.

SPECIMENS RECEIVED.—C.—W. H.

How to Use "ROUGH ON RATS."

WHICH is the most extensively advertised, the best known, and has the largest sale of any article of its kind in the world Used by all Nations. Some folks, after buying an article, will destroy or throw away the directions without reading them. Now and again some such person will say rats won't eat ROUGH ON RATS. If asked how they used it, it will be found they sprinkled it about, or at most, mixed it with a little flour or meal. Ask a complainant if he tried ROUGH ON RATS mixed with lard, grease, or butter, and spread on bread, cut in pieces, and laid about; or if he put it on raw or cooked meat, the leavings of fish; or if he has mixed it with cheese; or if he has mixed it with eggs and meal, or grease and meal, and if he covered up or removed other food rats could get at; to all of which he would probably answer no. Now, it's a notorious fact, known all over the world, that ROUGH ON RATS has never been equalled as a rat, mouse, insect, and vermin destroyer; and the cause of any failure is due to the stupid dulness or carelessness of the purchaser, rather than the inefficiency of the article. Occasionally an individual is found who will say the rats eat some of the ROUGH ON RATS, but it don't kill them. He don't see any dead ones. If asked if he hears or sees any live ones, he says no. Is it necessary that you see the dead ones? So long as you are clear of rats and mice, what more do you want? If occasionally a few scattering ones are left, set ROUGH ON RATS again, using some other material to mix it with. ROUGH ON RATS is a slow but sure poison. It is not necessary that each and every rat get the dose set. If a few of them get it, it makes them so sick and miserable they will kick up such a rumpus, and suffer so much that all are terrified and scared from the dreaded premises, and those that do get the dose—in their misery, work their way out of the building in search of relief and water, and die or stroll away. Thus your house is completely rid of vermin, and it is not necessary that you see dead or dying rats lying about to convince you. Every time you set or reset ROUGH ON RATS, use a different medium or vehicle to mix it with. See also special instructions with each package for use of ROUGH ON RATS, in clearing out Cockroaches, Water Bugs, Beetles, Ants, Insects, Hen Lice, Potato Bugs, Moths, Squirrels, Rabbits, Sparrows, &c. 7½d. and 1s. boxes, at Retail Chemists only. Wholesale only, F. NEWBERRY AND SONS, 1, King Edward Street, Newgate Street, London, E.C.

SANKEY'S famous GARDEN POTS

Bulwell Potteries, Nottingham.

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden Pots,' they are well made, light, yet strong, and we like them better than any other we have ever used."

Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your 'Garden Pots,' and still had them the best and cheapest."

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months: Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

HOLLOWAY'S PILLS.—Impurities of the Blood.—To ensure health, it is absolutely necessary that the fluids and solids of the human body should be kept free from those impurities which are continually getting admission into the system by erroneous living, unwholesome atmosphere, or disordered stomach. The only safe and certain way to expel all impurities is to take Holloway's Pills, which have the power of cleansing the blood from all noxious matters, and at the same time removing any irregularities which their presence may have already produced in any organ. Holloway's Pills expel all humours which taint or impoverish the blood, which they purify and invigorate, and give general tone. They are applicable to all alike—young or old, robust or delicate.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hoon, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with $17\frac{1}{2}$ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C. ALSO AT EDINBURGH AND ARBROATH.

A magnificent stock of Stove, Greenhouse, and Hardy Ferns, in 1400 species and varieties. CATALOGUE free on application. The most beautiful and complete

ILLUSTRATED CATALOGUE of FERNS (No. 22), ever published. 2s. post-free.

It contains 150 illustrations, and an immense amount of interesting and instructive matter of great value to all Fern Cultivators.

W. & J. BIRKENHEAD, F.R.H.S.,
 FERN NURSERIES, SALE, near MANCHESTER.

INTERNATIONAL HORTICULTURAL EXHIBITION, EARL'S COURT, LONDON, S.W.

Chairman of the Executive Committee—H. E. MILNER, Esq., F.L.S., C.E. Secretary—G. A. LOVEDAY, B.A.

FRUIT SHOW, GRAND COLLECTION OF BRITISH AND FOREIGN FRUITS OF ALL DESCRIPTIONS.

AUGUST 26 and 27, 1892.

MAGNIFICENT DISPLAY of CALLADIUMS, BEGONIAS, PALMS, &c.

Schedules and all particulars may be obtained on application to the Secretary, at the Exhibition Offices, Earl's Court, S.W.

In connection with this Show, a GARDENER'S SOCIAL DINNER will be held in the Exhibition Building, which will be provided at 4s. a head, inclusive. As only a limited number can be accommodated, the tickets will be issued according to priority of application. Dinner at 5 P.M. sharp. Mr. W. THOMSON, of Clovenfords, will take the Chair.

BOULTON & PAUL, HORTICULTURAL BUILDERS, NORWICH.

WINTER GARDENS, CONSERVATORIES, AND GREENHOUSES IN ALL STYLES.

GARDEN FRAMES in great VARIETY.

Surveys made in any part of the Country. LADIES AND GENTLEMEN WAITED UPON BY SPECIAL APPOINTMENT.

SATURDAY, AUGUST 20, 1892.

THE POTATO CROP.

THE returns which we received from all parts of the British Islands some time since were so uniform in general character, that it is hardly necessary to publish them in full. We may, however, select a few notes from various districts as containing information of interest to our readers. Speaking generally, the early varieties have yielded good crops; and the later crops, for which it is still too early to predicate with certainty, bid fair to yield unusually fine crops, especially in Kent. The amount of disease, so far, is slight in most places.

Potatoes are looking well, although late. Sharpe's Victor still leads for earliness. Sutton's Abundance is a fine cropper, a good variety, and a favourite here. *A. Angus, Dalziel Gardens, Motherwell, Scotland.*

Potatoes were late in starting to grow, and, owing to the prevalence of much rain, have run very much to growth; the tubers are small, and late in being formed. A week or two of sunshine would make a great improvement both in their quality and quantity. Our earliest are Sharpe's Victor, Veitch's Early Ashleaf, Rivers' Royal Ashleaf, Mona's Pride, Cole's Favourite, and Cosmopolitan. *W. Whitaker, Crewe Hall, Crewe, Cheshire.*

These so far, are looking well; earlies turn out well, but are small. Emperor, Bruce, Magnum Bonum, and Champion are the sorts chiefly grown as field crops. *A. S. Kemp, Broadway, Shifnal, Salop.*

Early border sorts are looking well, and Sharpe's Victor has turned out a grand crop, and Early Oxford is next in use. We never had a healthier or more promising crop. *Neil Sinclair, Park Hall Gardens, Oswestry, Salop.*

Potatoes are looking very healthy, but the cold, changeable weather is against the tubers swelling. Duke of Albany, and Beauty of Hebron are much grown for early use, and Clark's Main Crop in the fields. *George Harris, The Castle Gardens, Alnwick, Northumberland.*

Early Potatoes are fairly good on the whole though later than usual. We began to lift from a south border on June 30; a few had been lifted from the foot of a south wall before then. A well-selected sample of Veitch's Ashleaf is the best Ashleaf we grow, after trying a good many kinds. Late crops in fields, of which there are hundreds of acres grown within a few miles of us, look fairly well, but tall. Scotch Regents, Magnum Bonums, and a variety named "The Bruce," are the main kinds grown in fields. *Henry J. Clayton, Grimston Park Gardens, Tadcaster, Yorkshire.*

Early varieties are small and late; they were late starting into growth after being planted, through the dryness of the soil. In exposed situations they were much damaged by the frosts on June 15, 16, and 17; in many cases they were killed down to the ground. I have not seen the disease so far, neither have I heard of it about here. Late varieties have quite recovered from the effects of the frosts mentioned; I

have never seen them more promising at a corresponding date. *G. Norman, The Gardens, Hatfield House, Herts.*

The Potato crops in this district promised remarkably well until that most disastrous frost of June 14, which cut acres of splendid crops down to the ground. It was a sickening sight to witness at midday on June 15, the tops prostrate on the ground. The loss will be heavy to market gardeners and allotment holders. Clark's Maincrop, which is the best late Potato I know, escaped the frost. *G. Bloxham, Brickhill Manor, Bletchley.*

Potatoes look very promising, and, of the early varieties that we have lifted, no sign of disease has been seen. Both crop and quality are all that can be desired. Sharpe's Victor is a heavier cropper than any other early variety here. It is equal in quality, and two to three weeks earlier, and the best Potato for forcing I have yet tried. *J. Jaques, Waddesdon.*

Potatoes are looking wonderfully well in this district, and with the late welcome rains main crop varieties should be good. Early varieties have till now been small, owing to the long-continued drought. I am relying chiefly on four varieties this season which have proved best adapted to our soil, viz., Ringleader, which I consider the best early Potato; Early Regent, Abundance, a good Potato in every way; and Magnum Bonum. *A. Maxim, Heckfield Place Gardens, Winchfield.*

The best early Potato this season here is Sutton's Ringleader. Planted on a south border the end of March, they were ready to dig June 3. All other sorts promise full crops of good tubers. As yet, there are no signs of disease. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

It is early to give details in regard to this crop, but the early kinds have been good in quality, and a good crop without a trace of disease, though a little later than usual. Sharpe's Victor was excellent early in June, and Veitch's Ashleaf is now turning out a heavy crop of sound tubers in a nice condition. The ground having been dry, the flavour of early kinds has been better than usual. All late varieties are most promising. The genial rains early in the month will assist in swelling up the tubers, having come just in time to save the crops, and with fine weather we shall have enormous crops of late kinds. *Geo. Wythes, Syon House, Brentford, W.*

Potatoes are looking well; they came through the ground extra strong, and continued growing without any check. My principal sorts are Early Puritan, one of the very best for first and second early, and does remarkably well here; Prodigious, a new sort for main crop, sent out by Messrs. Veitch, of Exeter, promises to be an extraordinary cropper, also good in other ways; Imperator, I am trying for late use, but cannot yet say much about it, although above ground they are a grand sight. *A. J. Ballhatchet, The Gardens, Fulham Palace, London, S.W.*

The early crops in heated and cold pits and on borders have yielded well, clean grown, and free from scab. Veitch's Improved Kidney is preferred to any other, though Myatts' and other sorts are grown in quantity. The rainfall in this district is much below the average, 2.39 fell during June, which improved the crops immensely, and I never saw late crops look more promising. No sign of disease up to date. *Owen Thomas, Royal Gardens, Windsor.*

Potatoes generally look promising, being strong in haulm, and remarkably healthy. Early kidneys very late, numerous at the root, but somewhat small in size. Hebrons are turning out wonderfully well. Field, or market-garden farm crops never looked more promising. Digging Hebrons for market commenced July 7 with excellent results. *William Earley, South Esser.*

Early Ashleaf Kidney, Veitch's Prolific, splendid crop of fine tubers, and free from disease. The best early Potatoes we grow here on our stiff soil. I never saw them better, the late Potatoes looking well and very promising. The two best kinds grown

here is The Gentleman and Magnum Bonum. They do well on this clay and cold soil, and keep free from disease, and look well. *W. Smythe, The Gardens, Basing Park, Alton, Hants.*

Perhaps not so early as in some seasons, but a heavy crop and fine tubers; not a trace of disease is yet to be seen in haulm or tuber. Sharpe's Victoria still holds its own as an early forcer, and early supplies outside. Veitch's and Rivers' Ashleaf, Beauty of Hebron, Covent Garden Perfection, Magnum Bonum, Coldstream, M.P., Schoolmaster, Vicar of Laleham, and Chiswick Favourite still hold their own with me. *A. Evans, Lythe Hill, Haslemere.*

Potatoes in fields present an excellent appearance, but it is much too early to reckon on the yield. Late frosts (early in last month) did serious damage in low-lying districts and "moss" ground. Kidneys, Regents, and early sorts in gardens gave an excellent yield, both in size and quantity. Late varieties promise to be a very excellent crop. *B. Burham, Croxteth, Liverpool.*

Potatoes are doing well. Veitch's Improved Ashleaf is the earliest grown here, and is now yielding a very fair sample. Hebrons and Duke of Albany are looking well, no symptoms of disease at present. A later new variety, called The Gentleman, bids fair to be a most useful Potato; it was sent out by Messrs. Veitch & Sons. I grew it last year from seed supplied by the above firm. It is a handsome tuber, and of good flavour. *Chas. Turner, Cranfield Court, Bucks.*

Early varieties, such as Sharpe's Victor and Walnut-leaf, are turning out well, plenty of tubers, and of a good size. Late ones are looking well, and at present no signs of disease. Sutton's Abundance is the late Potato mostly grown in this district. It is not so good in quality as some of the old varieties, but it yields well, and during the last two years has scarcely shown any signs of disease. *Arthur Chapman, Weston Birt, Tetbury, Gloucester.*

Potato crops hereabouts are looking remarkably well, having escaped the frosts in the early part of June. The haulm is stout and healthy looking, and so far there is no disease in the tubers. Early varieties such as Early Oxford, Hammersmith, and Sharpe's Victor are lifting well, the crop being a good one, and the tubers are of good size. On the whole, Potatoes have not looked so well for some years. Lifting commenced June 11. *A. Ward, Stoke Edith Gardens, Hereford.*

Potatoes are everywhere in this neighbourhood looking most promising; the early crops are very good and fine, in quantity and quality. Sharpe's Victor proves to be a fortnight in advance of any other variety, and yields well. The Gentleman, a new late one, judging by its vigorous growth and appearance, should be an acquisition for field planting. *J. Austen, Witley Court, Stourport, Worcestershire.*

Potatoes all round are looking remarkably well, strong, and clean in the haulm, and if the dreaded disease will but leave them alone, the crop must prove a very heavy one at lifting time. Myatts' and Early Puritan are of excellent quality, the former being much larger than usual. We still find Sutton's Abundance the most reliable maincrop variety. *Walter Child, Crooms Court, Severn Stoke, Worcester.*

The Potato crops look satisfactory and well, as the recent rains came at an opportune time. Early kinds now being dug are rather under-sized. Sharpe's Victor is decidedly earliest, has but little haulm, and good in every respect, although not quite equal in quality to the slightly later section of Ashleafs. The frosts of June 18 did much damage in low districts. There are no visible signs of disease yet, but the present condition of the atmosphere is highly favourable to its development. *W. Crump, Madresfield Court, Malvern, Worcestershire.*

The Potato crop so far is everything that can be desired. All now depends on the finishing up of the season. Potato growing, I am pleased to be able to state, has, thanks to the Scotch immigrant farms, become a staple crop, and a great agricultural industry in Warwickshire. *W. Miller, Combe Abbey, Coventry, Warwickshire.*

Potatoes look well generally, but very late. Amongst new varieties Sutton's Ringleader takes the lead with us, of rather robust haulm, but good cropper, and satisfactory quality. *J. H. Goodacre, Elvaston, Derby.*

All Potatoes are looking very well and promising. We are now using Mona's Pride and Sharpe's Victor, both varieties good in size and flavour. We were quite a fortnight later this year, and few varieties injured by the frost of June 13 and 14. The Potato crop in our lower allotments ("Cottagers") was completely destroyed by the June frosts. *J. C. Mundell, Moor Park Gardens, Rickmansworth.*

Owing to the cold and late spring, early Potato^s in this district were quite a fortnight later than last year in being lifted, and in exposed situations the drought of the past two months has tended to ripen the tubers before they had attained their full size, consequently the crop will be lighter than usual. Up to the present date there is no sign of disease, and the quality is all that can be desired. Late kinds are looking remarkably promising; the rain in the beginning of the month has had a very beneficial effect upon them. *R. Milner, Penrice Castle, Swansea.*

The prospects of a good Potato crop are very favourable so far in this district, and no sign of disease has been seen up to the present. Early varieties have all turned out well, and yield good crops, amongst the best are Sharpe's Victor, Early Puritan, Woodstock Kidney, Early Rose, Old Ashleaf, and Beauty of Hebron. Those in the fields are all looking most promising. *R. C. Williams, Crosswood Park, Aberystwith, Cardiganshire.*

Although the Potato plants suffered much through the frosts of March and April, the central shoots being in many cases destroyed, the general crop has been abundant and the tubers large. Good prices were realised by the growers whose crops grew in sheltered places, and were not much affected by the frost, but they have fallen very low during the past few days, and are now being sold at 2s. 6d. and 3s. per cwt., a ruinous price to the growers. The fear of "the disease," coupled with the desire to recrop the ground, induce great numbers of the farmers to dig their crops before they are properly ripened. A few disfigured leaves, caught by the sun before the morning dew had left them, suffices to cause alarm, and spread the huge "disease." Patience in many cases would be productive of better results. *Chas. B. Saunders, St. Saviours, Jersey.*

The Early Rose is excellent, also the Flounders are a prolific crop. The field Potatoes are looking better than I remember for many years, and all kinds are a success up to date. There has been thunder and much rain to-day, and I fear the blight may set in at once. *William Ryan, Knockafry, Clonmel.*

NEW OR NOTEWORTHY PLANTS.

VANDA VITELLINA, n. sp.*

THE plant resembles in every respect the well-known *Vanda corulescens*, Griff., and especially the variety *Boxalli*, but the flowers are by far smaller, and the colour is as yellow as a yolk. Differences in colour only are, of course, not sufficient to establish a new species; but as in *Dendrobium chrysocephalum*, the labellum shows us characters which,

* *Vanda vitellina*, n. sp.—Aff. *V. corulescens* et variet. *Boxalli*. Caule foliisque omnino *V. corulescens* foliis satis crassis anguste linearibus apice inaequali-bilibus utrinque obtusatis; racemo erecto laxifloro plurifloro (16 in specimen nostro); bracteis minutissimis triangulis; ovarii pallidis c. pedicellis 3 cm. longis tenuibus; sepalis dorsalibus cuneato-obovatis lateralibus unguiculatis orbicularibus; petalis minoribus obovato-oblongis basi semitortis omnibus obtusis; labelli lobis lateralibus cuneatis antice retusis erectis, intermedio multo majore cuneato antice medio bipartito disco, callis 3 subparallelis instructo, intermedio minore brevioribus, lateralibus latioribus longioribus (totum discum occupantibus), antice abruptis margine anteriore serrulatis, calcaris subulato subcompresso recto intus melle scatente; gynostemio generis, candelula satis lata inter pollinia apiculata glandula transversa. Totus flos 1 cm. diametro vitellinus; labelli lobi laterales et gynostemium minutissime purpureo-punctulati; lobis intermedii albidis caeruleo-punctulatis. *F. Kränzn.*

after the present opinion of systematical orchidography, are regarded as sufficient for a new species. It is not at all pleasant to describe new species of Orchids under circumstances as we enjoy them, for the last three years, and for a fourth of a century forward things will be in the same condition. The best we can do is to observe as accurately as we can, to spend a heavy lot of time and labour in the preservation of the most dispersed of all botanical literature, and when at last we are not satisfied, to give a true description. It is quite unavoidable that a new edition of J. Lindley's immortal work, *The Genera and Species of Orchidic Plants*, would be the grave of a good many newly published species, but we cannot help it.

The species now published is a gay-looking thing, of at least some horticultural value, if even not a great one. We received fresh material from the Royal Botanic Garden, Berlin, and are informed that the plant, which flowered this very time, was obtained by Messrs. Seeger & Tropp, East Dulwich, London. *Dr. F. Kränlein.*

KINMEL PARK GARDENS.

ON the escarpment formed by the outcrop of carboniferous limestone overlooking the beautiful and fertile valley on the new red sandstone known as the Vale of Clwyd, this finely-wooded park is a conspicuous feature to travellers on the North Wales coast between Rhyl and Abergale. It faces due north, and is separated from the sea by a plain about 3 miles across. The grounds immediately around the house have been made into beautiful terraces, thickly planted with choice shrubs, over which fine views of the surrounding waste may be obtained.

The trees show a luxuriance scarcely to be expected from the exposed situation and poor soil. All plants which do well at the sea-side flourish here.

Large Evergreen Oaks furnish shelter to the coniferous vegetation, which includes *Cupressus macrocarpa*, *Wellingtonia*, *Cedrus*, *Juniperus*, *Abies*, *Retinosporas*, &c., which do well where the protection from the wind is efficient.

The only difficulty about sea-side planting is the strong salt-laden winds, but the effect of this may be avoided by planting thickly, as has been done here.

Olearia Haastii covered with white flowers, and the Holly-like *Desfontainia spinosa*, full of orange and yellow blossoms, were conspicuous. Large clumps of *Laurustinus* and *Escallonia* about 3 feet high, looked well, they are sometimes cut by frost but soon recover. Clumps of Golden Elder relieve the deep green of the shrubs. Because of the quantity of lime in the soil, *Rhododendrons* and *Azaleas* do not grow well; and for the same reason Beech trees flourish remarkably. In places where old Beeches have been broken by the wind, the stumps are left standing; Ivy planted around which soon covers them with a green mantle. A pretty effect is produced by allowing climbing *Roses* and *Tropæolum speciosum* to grow along with the Ivy.

A well-kept kitchen garden, about 7 acres in extent, presents some interesting features, and notwithstanding the northern aspect, the plants look well. We noticed a bank planted with red Currants, loaded with splendid fruit the whole length of the branches, and side by side with these were a few bushes without fruit, and the difference between the two was due to the former having been stopped and thinned last summer, causing fruit-spurs to form. The question is often asked, "What fruit trees shall I plant on a north wall?" Here is a splendid crop of Lord Grosvenor Apples on horizontal trained trees growing on a north-west wall. A large extent of the south walls is taken up by lean-to houses. A difficulty was experienced with the Vines when first planted, the growth being very gross, producing little fruit. To remedy this, a load of sea-sand and five loads of the heavy calcareous loam of the district were mixed together with ground bone, and rammed firm. Since this plan has been adopted, the gardener, Mr. D. D. Hughes, has always

been able to secure crops. *Gardenias* and *Stephanotis* are grown in old Pine pits by themselves, and are in this way easily kept clean by syringing. A large *Luculia gratissima*, about 7 feet high, is growing in a border in the conservatory. On account of the difficulty of propagation, the deliciously-scented flowers of this plant are seldom seen. It has been successfully grown from cuttings here by so arranging the supply of aerial moisture that the cuttings never flag for want, neither decay from excess. *F. V. D.*

NEW NOTES.

MR. WILLIAM TRUELOVE retired from the service of the Royal Gardens, Kew, on April 30 last, after serving twenty-six years as foreman of the Arboretum, a position which he filled with great credit to himself, and satisfaction to his superior officers. Before coming to Kew, Mr. Truelove had charge of the then famous Bieton Arboretum, and his selection to fill the post from which he has retired has been justified in every way. From small beginnings—the number of ligneous plants cultivated in the open air at Kew was comparatively very small twenty-six years ago—the Kew Arboretum has developed to a considerable extent; at the present moment it contains about 3000 species and named varieties, excluding garden varieties of such plants as *Roses*, *Rhododendrons*, *Hibiscus*, &c.

The Superannuation Act of 1887 having practically abolished the pensions to which men in Mr. Truelove's position were formerly able to look forward, he was, on retirement, only entitled strictly to the gratuity of £47 10s. which the Treasury awarded him. But in consideration of his exceptional services, the First Commissioner was pleased to make a special application on Mr. Truelove's behalf to the First Lord of the Treasury. This obtained for him a further grant, though it was expressly stipulated that this was not to be regarded as a precedent for the future. The Board recorded the award in the following minute:—

"Director of Kew, to inform Mr. Truelove, "In dispensing with his services the Board desire to record their appreciation of the diligence and skill which he has shown in the discharge of his duties during the period that he has been in their employ. It is to a large extent in recognition of this that the First Commissioner recommended, and that the First Lord of the Treasury has granted, an additional gratuity of £120 from the Special Service Fund. "May 17, 1892." "H. W. P."

MR. W. J. BEAN succeeds Mr. Truelove as foreman in the Arboretum. Mr. Bean first entered the Kew service from the gardens of Belvoir Castle on April 2, 1883. He was not long before rising to the rank of sub-foreman, and on the retirement of Mr. Binder in 1888, Mr. Bean became foreman of the Temperate-house.

Mr. Thomas Jones fills the post of foreman of the Temperate-house, vacated by Mr. Bean. Mr. Jones came to Kew as gardener on January 2, 1888, from the nurseries of Messrs. James Dickson & Sons, of Chester. In July, 1889, he was promoted sub-foreman in the Palm-house.

Borassus flabelliformis.—Kew is indebted to His Highness the Gaekwar of Baroda for a healthy young specimen of this, the Palmyra Palm, which has lately been received, and may now be seen in the Palm-house. Hitherto all attempts to grow this Palm to any size at Kew have failed, although we have now healthy seedlings which were raised from seeds presented by the Right Hon. Sir M. E. Grant-Duff, G.C.S.I., in 1886, when Governor of the Madras Presidency. The specimen from Baroda has a trunk 2 feet in diameter and 4½ feet in length, and although its roots perished on the journey, it is otherwise in good condition. It had been lifted and carefully packed by Mr. Henry, the Superintendent of the Baroda Gardens. We are also indebted to Mr. W. Goldring, who kindly interested himself in this matter whilst at Baroda, where he is engaged in laying out new parks and gardens for the Gaekwar.

A new house for filmy Ferns has just been erected on the north side of the large fernery (No. 2), and the plants removed from the old house (No. 3), which is to be replaced by one more suitably adapted for the cultivation of temperate Ferns. The filmy Fern-house is 50 feet by 14 feet, with a central path and two cases running the full length of the house. The Cooper-Foster collection is now incorporated with the Kew plants, the whole forming an exceptionally rich collection of these delicate little Ferns.

A very extensive and valuable series of products, illustrating the varied uses of the Bamboo in Japan, has recently been presented by Charles Holme, Esq., F.L.S. It has been arranged in two cases in Museum No. 111., and shows at a glance both the ingenuity of the people in adapting this valuable arboreal grass to their daily wants, and the suitability of the Bamboo stem to the purposes to which it is put. This collection worthily supplements the large and interesting set of Bamboo products from various tropical countries previously shown in the classified collection in Museum No. 11.

Another interesting, though temporary, addition to Museum No. 111., is a framed set of twenty-one large photographs, representing views of tropical scenery, and plants in the island of Grenada, taken by R. V. Sherring, Esq., F.L.S., whilst investigating the cryptogamic flora of that island for the West Indian Exploration Committee of the Royal Society and British Association. Mr. Sherring has deposited the collection on loan for a short time.

A very remarkable gouty-stemmed Balsam was lately figured and described in the *Botanical Magazine*, t. 7195, from the east coast of Sumatra, under the name of *Impatiens mirabilis*, Hook. f. The perennial stem is about 4 feet in height, and the thickness of a man's leg. It has large yellow flowers produced on short lateral racemes. There are several living plants in the Kew collection, one of which is in flower now (July, 1892). The following additional information respecting this Balsam has been forwarded to this establishment by its discover, Mr. Charles Curtis, Assistant-Superintendent of the Gardens and Forest Department, Straits Settlement, in a letter, dated Penang, May 3, 1892:—"I have recently been to the Langkani Islands, where I obtained many interesting plants, a set of which has been put aside for your herbarium. I saw some fine specimens of *Impatiens mirabilis*, Hk. f., with stems 5 feet high, 22 inches in diameter at the base, and with twenty or more branches, each having two or three expanded flowers, and numerous buds. It grows in places difficult of access, on sharp-pointed limestone rocks that cut like knives. It appears to lose its leaves entirely during the dry season, and was only just commencing its growth when I was there last month." *Kew Bulletin.*

COMMERSON.

The story of Philibert Commerçon, Botanist and Traveller, and Jeanne Baré (1727—1773).

(Concluded from p. 126.)

THE Bougainville expedition, after leaving Tahiti, visited the shores of New Britain, the coast line of Papua or New Guinea, several of the Molucca Islands, and the Isle of Java, Batavia, &c.

Towards the end of 1768 Bougainville's ships reached the French colonial possession, the Isle of France, where M. Dumas was then Governor, and associated with him in the civil administration of that island and Bourbon was Pierre Poivre, the gifted intendant and personal friend of the French Minister.

Here orders were in waiting from Paris that Bougainville was to leave his naturalist and sail home without him, as it was intended that Commerçon should be desired to visit the great continental island of Madagascar and report upon that land of promise, as well as upon the Mascarene Islands themselves.

Jeanne Baré remained behind too, for she was by no means anxious to return to France, although M. Bougainville generously offered to take her back to Europe, and he had influence sufficient to secure for her a certain livelihood and employment which would secure her from want in her native village; but she refused to leave Commerçon and his life's work, in which now she had become wholly absorbed.

It was with excessive regret that Bougainville and his companions parted with their comrades, that strangely assorted pair, the naturalist and his assistant who had endeared themselves to one and all on board the expeditionary vessels.

Commerçon proceeded to Madagascar, and of his researches there space does not permit any detailed allusion. It is, perhaps, sufficient to quote from his letter to Lalande, written on April 18, 1771, after four months' wandering in the woods of the south

portion of the great African island where he had established his headquarters with Count Mandane, who was doing his best to resuscitate the abandoned colony formed by the French East Indian Company at Fort Dauphin.

Whilst in the island of Bourbon, Commerson described the volcano which is perennially active, and his description proves that he was as careful an observer of geological and mineralogical details as he was of the fauna and flora of the new regions in which it was his delight to discover new species, genera, and families.

The young Breton, Mlle. Jeanne Baré, yet followed him in all his peregrinations, and in her he found the ablest possible assistant in saving and preserving the materials for his herbarium and mineralogical collection. The voyages which Commerson had made with Bougainville, and his subsequent arduous explorations in Malagasy forests and malarious lowlands near Fort Dauphin, together with laborious ascents of the difficult and precipitous ravines and mountain peaks in the Mascarene Islands (where he was sometimes for eighteen hours at a stretch in the woods and on the scarped volcanic precipices which abound in all those islands), added to long unremitting work at the desk and with the microscope, must perforce have tried the physical and mental strength of Commerson to the utmost. Life to Commerson was no object in comparison with work, and he undoubtedly sacrificed himself in the cause of science. Repeated attacks of fever prostrated the hitherto energetic explorer, and alas! in those days quinine was unknown, and Commerson had not reached the Cordilleras, where the Cinchona was then only to be found in its original native habitat. Thanks to Mr. Clements Markham, our pioneers in Madagascar now-a-days are able to procure quinine at a reasonable price, and the Malagasy fever has lost many of its terrors to those who are able to resist its too frequent recurrence by doses of quinine.

Philibert Commerson made a brave fight for life; he continued work up to the latest moment, and even contemplated a voyage to New Zealand,* but complications ensued, and this brave naturalist succumbed finally when in his forty-sixth year, dying at The Retreat, the home and residence of M. Bézac, near Flacq, in the Isle of France, on March 13, 1773.

M. Bézac, M. Auguste Vinson tells us, wrote the next day to M. de Bompar, Commissary of the Naval Department, and Controller for the islands of France and Bourbon, announcing the death of the noted naturalist, which, he said, had occurred at a quarter of an hour before midnight. The body was interred that same day, after morning mass, in the parish churchyard. By an honourable exception, which was then without precedent, although he had neither read, nor even sent to be read, a single memoir to the Academy of Sciences, that illustrious body of scientists unanimously elected him as a member of their faculty in spite of his absence. Alas! he was not only absent from France, but from the world. Those who believe in spirits can well imagine that his spirit was present when his election was discussed, and on the same day that Antoine Laurent de Jussieu (the nephew of the great Bernard de Jussieu) was solemnly admitted to the august assembly. This nomination was, M. Emile Blanchard says in the *Revue des Deux Mondes*, "a wreath deposited on a tomb," as it took place on March 21, *i.e.*, eight days after the death of the botanist, which, of course, was not known in Paris for some months afterwards. However, this posthumous honour was well merited, and the victim to science could have wished for no better monument, *perennis ære*.

Forster, who had traversed the same seas with Captain Cook, dedicated to his co-worker the genus of plants now known as Commersonia; and Lalande wrote his eulogium, which is to be found in *Obs-*

vations sur la Physique et l'Histoire Naturelle, par M. l'Abbé Rozier, 1775, in 4to, tome 1^{er}, p. 39.

Following the example of Linnæus, Commerson took great pains that the names which he gave to his newly-discovered genera and species should bear some analogy or hidden allusion to whom he dedicated them, and that these names should express his regard or contempt, his love or his aversion, for certain characters thus handed down to posterity. This quaint kind of apotheosis is a fantasy, in which botanists sometimes indulge themselves, and seldom abuse.

Among the various friendships which Commerson thus immortalised in naming genera, species, and individual plants, it may be sufficient to indicate a few of the most remarkable of his discoveries. Thus it is to Commerson that we owe the name *Hortensia* given to that plant, originally brought from China, whose blossoms have ever since been such a favourite decoration in the gardens and drawing-rooms throughout Europe.

The Bougainvillea that brilliant creeper whose bracts, tinted with the most lively colours of roseate-lilac and rouge-carmine, which he discovered in Brazil, and introduced into Bourbon and Mauritius, where they cover the trellis arbours and roofs with splendid effect; the Poivre, another Vine-like creeper, which flowers in October, and exhibits its purple clusters in the lowlands of Madagascar; the Lalandia, the Marignia, the Jossignia, the Chuzalia, the Cossignia, &c., recall each in turn his friends.

His constant and faithful affection for his wife is immortalised in the fruit of a plant which resembles two hearts united, and which he named *Pulcheria Commersonia*.

To one star-like flower, whose sombre calyx is, as it were, bedecked with tears, which only opens for a few hours, and closes soon, he gave, as in regret, the name of his valued friend and comrade, Véron, a young astronomer who, left by Bougainville at Mauritius, died in the flower of his age, when scarcely thirty-two years of age. He called it *Veronia tristiflora*.

But if this scientist and poet immortalised his friends and his affections by these tender souvenirs inscribed in flowers, he was also capable of holding up his enemies to ridicule, sarcasm, and ignominy. His pen in these few instances could sting, and draw blood.

It will be remembered that even the great Linnæus, annoyed by the jealousy and attacks of Buffon, named the toad *Bufo*. This name has survived as the permanent name of the genus.

In like manner Commerson has perpetuated the name of another crank. A compatriot of Commerson, who belonged to the preceding generation, and bearing the same Christian name, Philibert, was Collet, born at Châtillon-lès-Dombes in 1613. Collet criticised Tournefort, and accused him very severely of having changed the ancient method of classing plants by leaves, and of finding the character in the flowers, fruits, and seeds. Commerson, who estimated his compatriot's botanical acumen at its true worth, or rather worthlessness, dedicated to his memory a genus of plants which he named *Colletia*. The characteristic species, *C. spinosa*, is a shrub of disagreeable appearance, armed with thorns, and destitute of leaves, by which he indicated an allusion to the ignoble classification Collet sought to impose on science, and the prickles to be analogous to the carping criticism of this author. Thus Tournefort was avenged by Commerson.

Commerson, by his will, left as a legacy to the Natural History Museum in Paris his immense collections of plants, fishes, &c., together with his manuscripts—in all filling thirty-two huge cases—which reached Paris during the following year in good preservation. His collection contained upwards of 5000 plants, of which 3000 were new to science, forming 160 new genera. His dried plants filled 200 volumes in folio.

The bulk of Commerson's manuscripts, his magnificent collections of fishes, animals, and plants,

remained buried in the cellars of the Museum, whilst his successors have described under other names than those long before selected by their original discoverer the genera and species of plants. Tardy reparation has since been done to assign the true claims of their real owner; but in all respects his early death prevented his reaping the harvest of glory which he deserved. His present well-deserved reputation would have stood on a far higher pinnacle of renown. He was the first to dip into the treasures of new regions of Nature hitherto untouched by a scientific visitor-searcher.

Commerson's reputation has, however, been considerably rehabilitated during these latter days of ours, as he is now recognised as one of those who initiated modern scientific methods, and in advance of those around him may be accounted as one of the first workers of the present spirit of philosophic inquiry.

Unforeseen circumstances have contributed comparatively lately to bring forward his name in greater prominence, and his labours are only now becoming fully appreciated by the light thrown on them in results of recent research.

So occupied was Commerson up to the last in the active search for materials amidst the prodigal wealth of Madagascar and the Mascarene Islands, that he had never leisure to indite the large work which he contemplated as the outcome and fruition of years of toil. As it was, he published no essential work, and but fragmentary letters have been preserved.

One of these letters, however, is inserted in its entirety in the Supplement to M. Bougainville's *Voyage*, which, curiously enough, appeared first in English; and it is only by the translation by Fréville (Paris, 1772, in 12mo) that it is known to Commerson's own countrymen.

Baré was the first woman who ever made a voyage round the world. Her example was followed by Madame de Freycinet, who, dressed as a midshipman, accompanied her husband during his voyage of discovery. Something may be said about her in a later communication. *S. Pasfield Oliver, Capt., Moray House, Anglesey, Gopport.*

REMARKS ON THE FRUIT CROPS OF 1892.

[For Tabulated Summary, see p. 93.]

(Concluded from p. 182.)

WALES.

CARDIGANSHIRE.—With the exception of small fruits, the fruit crop is a failure in this district, although a better show of blossom has not been seen for many years, and at that time hopes were very high of obtaining a good crop, but the late severe frosts shattered them; even on walls with a double thickness of fish-netting, the bloom was all cut off, and only on some of the later varieties of Apples and Pears will any be obtained. The trees are making abundant growth, and we must hope for a fine autumn to ripen the wood for a better crop next year. *R. C. Williams, Crosswood Park, Aberystwith.*

DENBIGHSHIRE.—Apples are an excellent crop, and clean. Pears thin, but clean, and swelling well. Plums very thin on walls, but fair crop on standards. Cherries good crops, but Morellos are falling off a good deal. Bush fruits fine crops. Strawberries huge, and good quality. *P. Middleton, Wynnstay Gardens, Ruabon.*

— Apples an average crop as a whole. Some of the newer varieties much under. Pears average. Plums and Damsons in this immediate neighbourhood a very heavy crop, in other places rather scarce. Cherries abundant. Peaches and Nectarines a full average. Apricots very heavy crop. Small fruits abundant, and of good quality. Strawberries are only average, while nuts of all sorts are a very full crop. *Jas. Loudon, The Quinta, Chirk.*

GLAMORGANSHIRE.—The fruit crop in this district is very partial, Apples being much under the average, although many of the kinds showed well for bloom.

* Crozet had just returned from his voyage to Tasmania and New Zealand, in charge of the ship "Mascarin," which had been commanded by Captain Marion du Fresne, who was killed at the Bay of Islands in the Northern Island, which M. Marion had called France Australe, on June 12, 1772.

A great percentage dropped, no doubt owing to last year's wood not being thoroughly matured. The varieties carrying the best crops are Cellioi, Cox's Orange Pippin, Lord Grosvenor, Gillyflower, Wellington, Stirling Castle, and several local varieties. Plums are a very light crop. Pears, average. Louise Bonne of Jersey, Winter Nelis, Forelle, Pitmaston Duchess, Thompson's Berré Diel, and Brookworth Park, are amongst the most fruitful. Strawberries have been exceptionally good, but smaller than usual, owing to the long spell of dry weather which we have had in this district. Cherries, both the Morello and the sweet kinds, are carrying heavy crops; all small fruits are very fine, and heavy crops. *R. Milner, Penrice Castle Gardens, Swansea.*

GLAMORGANSHIRE.—Pear trees trained on walls and growing in the open quarters of the garden never promised better for an abundant crop than they did in the early part of the season. The branches were covered with strong healthy flowers, which to all appear-

10. IRELAND, S.

CORK.—The fruit crop, generally speaking, is light (Strawberries excepted), particularly stone fruit on walls, which suffered much from severe frosts when in flower. Small bush fruit is a good average crop. *R. Wilson, Mitchelstown Castle.*

KILKENNY.—Apples, where well sheltered from east winds, are fully up to the average, but in exposed situations the crop is a light one. Pears, Plums, and Cherries are under the average. Gooseberries were much damaged by frost when in flower, and are consequently a light crop. Strawberries were plentiful, but owing to the constant rains, were of bad quality. *William Gray, Woodstock, co. Kilkenny.*

WICKLOW.—Gooseberries and Currants of all sorts are bearing an excellent crop of fine fruit. Apples are plentiful. Plums looked promising when in blossom, but were injured with frost, and are poor crops generally, with the exception of Damsons,

during the past month, the sun rising at 4 A.M., and setting at 8 P.M. Less of his brightness, and more moisture, would have produced better results. The growth of fruit trees generally is very satisfactory and encouraging. *C. B. Saunders, St. Saviour's.*

NURSERY NOTES.

BEGONIAS AT BENLEY HEATH.

At the Crook Lodge Nursery, Bexley Heath, Mr. Thos. S. Ware, of Tottenham, has a very gorgeous display of tuberous-rooted Begonias in full bloom. Nothing else is grown in this branch of the Tottenham establishment, but there are, in all stages of growth, some 200,000 to 300,000 of these plants. The greater part of them are seedlings planted out in a large field close by, and amongst these are a great many possessing excellent merit. Indeed, a walk through the field, and a study of the double and single varieties, will soon convince any of the excellence of the strain. The natural soil here is a sandy yet rich yellow loam, peculiarly suitable to the Begonia, and it is used for potting purposes with a little leaf-mould added. A great mistake is still frequently made by gardeners in the compost they pot their Begonias with. This section does not like peat, and where a suitable loam can be obtained the peat should be discarded altogether. The natural fleshy roots developed in loam are far more advantageous than the thin wiry roots induced by the use of peat. Only with heavy loam is there any excuse for using peat at all in potting these plants. The bulbs they make in the field here are surprising, although the cold weather has prevented the foliage from making much headway.

It is, however, in the houses that the visitor is shown the decorative quality of the Begonia, and there is at the present time a first-rate exhibition of double and single flowers. Amongst the doubles are a large number of the now well-known Duchess of Teck, just commencing to flower; Duke of Teck, the double crimson; and Princess May, which has been so much in evidence at exhibitions this season, bearing its white crimp blossom, was also there; as was Baronne de St. Didier, a delicate straw-coloured variety; and Beauty of Belgrove, which so much resembles in colour and appearance the Rose, La France. Among the new ones of Mr. Ware's raising is Miss Jennie Fell, with perfectly-shaped flowers of a rosy-crimson, but not large. Mrs. Francis Fell is a double salmon-pink, and very large. A very dwarf variety of good habit is Floribunda; the blossoms are dark rose—it would make an excellent bedder. Pioneer is of exceptionally good habit, and the flowers are pale pink. Countess O'Gorman is a pretty primrose or sulphur-yellow, not large, but of good quality. Henshaw Russell, certificated this year, is a rosy-crimson Camellia-like bloom. Pavnionia might be taken for a Carotation from its appearance; the colour is a curious blending of bronze and red. Alba magna is a lovely variety, bearing snow-like blossoms, which are very fine and full; it is dwarf, and of good habit. As a result of last year's crossing, there are some very curious and some very fascinating brooze-yellow seedlings in great variety, which have not yet been named.

The singles, when seen together in a house, appear to create a more striking effect than the doubles, and the seedlings show such good and varied forms, that it would seem to be a waste of time almost in naming them.

These, however, are some of the best that are yet named at this establishment, but some seedlings we saw are equally beautiful. Maid of Kent, of good habit, has flowers of a pale straw colour. Lord Byron has scarlet flowers with white eye; it is large and good. Fimbriata is white, with fimbriated margin. Devonia is a very good thing; flowers are large, and of a dark bronze. Bexley White has good wide petals, and they are pure white. Blushing

FIG. 34.—EUCHARIS BAKERIANA (COMPARE FIGS. 35 AND 36).

ances would have set well had it not been the sharp frost we had here on the morning of April 15, which destroyed the organs of fructification. The crop, with a few exceptions, is a complete failure in this district. *A. Pettigrew, Castle Gardens, Cardiff.*

PENBROKESHIRE.—The late and very severe spring frosts did great damage to the fruit crops in this district. All fruits bloomed strong and well, and gave promise of a full crop; but gales and frosts destroyed nearly all. Of Pears some of the early blooming sorts carry a light crop. They had set before the frosts came. Amongst Apples King of the Pippins appears to have withstood the weather best, as usual. Alfriston is also very fair. All other varieties greatly damaged. Apples on walls, of which we have a fair collection, are all good. The only Plum of which we have a crop is Rivers' Early. It was the last to bloom. Even the Victoria is a failure. *Geo. Griffin, Slebeck Park, Pembrokeshire.*

9. IRELAND, N.

WESTMEATH.—The fruit crops in general are very bad; no stone fruit worth notice, and Pears and Apples a failure. *John Igoe, Garden Vale, Athlone.*

which are a good crop. Strawberries yielded good crops of large-sized fruit. The first dish of Strawberries gathered here was from Laxton's Noble on June 19, and later varieties held out another month. *W. Cooper, Killruddery, Bray.*

CHANNEL ISLANDS.

JERSEY.—The appearance of the Apples and Pears at the blooming season left little to be wished for; they were really beautiful, with superabundance of flowers, but the cold winds and biting frosts of March and April caused the greatest destruction amongst them, and, in many cases, despite the skill and care of the pruner to produce such promising evidence, there is but very little fruit upon the trees. Apricots are always a fickle crop, because of the early season at which the trees bloom. Nectarines, Peaches, and Plums have fared better, owing to their being planted in the more sheltered situations. Small fruits, from their more hardy nature, are abundant, and good. Cherries are fairly good on deep soils, but Morellos are dropping off the trees, from the drought. Strawberries were fine and good at the early part of the season, but suffered from the dry weather. We have had much sunshine

Bride is very distinct; it is a charming blush, falling to white in centre. Challenger, certificated last year, is a dark crimson, of good substance. Sovereign is a beautiful primrose-yellow; its habit is good, and the foliage is very pretty.

THE PROMISE OF THE SEED CROPS.

LINCOLNSHIRE rivals Essex, Bedfordshire, Cambridgeshire, and some parts of Kent as a seed-producing county, especially that level portion of it stretching away from Peterborough, including the districts of Spalding and Boston, to the shores of the Wash, and the German Ocean. The soil generally is a rich alluvial one—a fine and fertile deep yellowish loam, of excellent heart, and which, well tilled, is capable of producing heavy and luxuriant crops. Round Boston are many small holdings, cultivated as market gardens, in which Potatoes are largely grown, especially the Ashleaf types, and from one small station near Boston there were despatched during the last week in July as many as 100 railway trucks daily, each containing from 5 to 7 tons of Potatoes, the prices realised being about £2 per ton—far too low to adequately cover the expense of production. The Potatoes produced from the land hereabouts are generally of excellent quality, and, so far, but little disease is apparent.

About Boston, Peas are largely grown for seed purposes. Messrs. W. W. Johnson & Sons, the well-known seed merchants of Boston, are large growers, and place out extensive contracts with the farmers for Peas, as well as for Turnips, Mangels, &c. An inspection of the growing crops made during the past week showed that, should the fine dry though somewhat cold and sunless weather continue, there is the prospect of a fair field. The cold and dull weather which prevailed during the time the plants were in flower operated to prevent many of the blossoms from becoming fertilised, and there are some failures in consequence. A summer remarkable for the prevalence of cold and dulness, and the absence of much-needed sunshine, has been experienced in the Lincolnshire district. The more tender main crop and wrinkled Peas have suffered even more from the foregoing causes, and many abortive pods do not contain Peas. The ultimate condition of the crop depends very much upon the weather during August; if rain should set in, the effects will be disastrous; at best, only a fair yield can be anticipated, owing to the pods being so unusually late in ripening. The absence of sun has caused a good deal of mildew to put in appearance on the lowlands, which affects prejudicially the development of the pods. Then, the showery season caused a superabundant growth of weeds among the Peas, and as the haulm lies upon the ground, sun and drying winds are necessary to thoroughly ripen the pods.

Broad Beans, represented by Longpods and Wind-sors, are short in the stalk; they bloomed freely, and set fairly well, and, so far, promise good average crops, if they escape the black smother-fly which has made its appearance in some districts. All cultivators of Beans find this to be a terrible pest, and very injurious to the crops, which are badly in want of fine sunny weather. The common Horse-Bean is largely grown in some parts of Lincolnshire. French Beans and Scarlet Runners are but little grown for seed in the Boston district, the soil not being suitable for them, lighter land being required to grow them on for seed purposes.

Onions are but little grown for seed also, though largely for market.

Carrot is only sparingly grown for seed, and of the varieties, the Altrincham mainly, which does well in the fine deep soil, and is the leading Carrot both for private and market use. Only limited breadths of the choicer varieties are cultivated, and what there are of them look well at the present time. Parsnips also are not grown for seed in Lincolnshire.

Parsley, like some other things, suffered severely from the past winter, and very short breadths can be seen; but what plants there are look remarkably well. It is expected Parsley seed will be very scarce.

Parsley for seed is sown in June, and this enables the plants to be quite strong enough to stand through an ordinary winter.

Mustard, and more especially the brown variety, is largely grown for manufacturing purposes, and on good and well-managed lands the plant is good, and the seed crop promises fairly well. Although in some districts the Mustard-beetle has brought damage to the crops, there is not much room for misgiving as regards the brown seed, but in reference to the yellow or white-seeded Mustard, the beetle has made sad havoc, and in some parts of the country the crop is entirely lost. The plants standing have been so severely damaged that the poorest results must follow. In the ten districts of Lincolnshire, where a few years ago Mustard was extensively grown, and proved a remunerative crop to farmers, the beetle so damaged the crops, that for two years scarcely any seed has been sown. This year a few growers tried again, but with the same disastrous results. It is said the best way to exterminate the Mustard-beetle is to cease to grow a crop of this plant for a few years, as the insect seems to decline for want of the Mustard-plant to feed upon.

Of Mangold Wurzel seed only very small breadths are seeding, so many plants having been killed by the severity of the winter and the late frosts in spring. There is, therefore, much less Mangel being grown for seed purposes than for years past. The small breadths promise a good yield at present, and there is no apprehension of damage from insect or other causes. In this part of the country the Yellow Globe finds the greatest favour with farmers, and especially that type known as Johnson's Selected Golden Globe, which is now extensively grown, and has become quite a standard variety, and also the Golden Tankard. The farmers of Lincolnshire appear to be becoming alive to the fact that the yellow-fleshed Mangels have higher feeding qualities over the red sorts, and though they may not yield quite so much weight per acre as the ordinary large varieties, are yet much more valuable for feeding purposes on account of the saccharine juice they contain.

Swedes and Turnips, both yellow and white-fleshed varieties, are represented by small breadths, and the crops on the whole are not very promising. The Swede Turnips have suffered considerably from canker, owing to the severe character of the winter; and the bladder, as it is termed, has affected the pods, thereby greatly reducing their fertility. The yellow Turnips, which promised fairly well at blooming-time, are not doing so well, owing to the action of blight, and there are many immature seeds. If ever the Lincolnshire seed growers and farmers had reason to long for the bright and warm sunny weather of traditional August, it is at the present moment. *Pisum.*

HOW TO REJUVENATE OLD VINES.

FOR some time the old Vines here had been gradually drifting into a very unsatisfactory condition of health, becoming weakly in constitution, and, of course, correspondingly weaker in fruitage, so that the dilemma presented something like two alternatives, one of which was to grub out the Vines, make new borders, and replant with young canes; the other to, in some way, renovate the old borders, and impart fresh life in the old Vines. Had men and material been as plentiful as they used to be during the earlier days of these gardens, I have no doubt the former method would unhesitatingly have been adopted. However, the latter way was chosen, and the sequel of this paper will serve to show how we set about it, and to what degree we succeeded.

We have six vineries in a row, and our renovating process was begun at one end by removing all the effete earth until we found something like roots. If during this operation the border was found to be in a dry state, we threw on a liberal sprinkling of Thomson's Vine Manure, slightly forking it in, then washing it well down with a liberal dose of water.

On the top of this we laid on a coating of fresh loam already mixed with more of Thomson's, to a depth of from 3 to 5 inches, as necessity suggested. This done, the surface was made level and lightly trodden; we then paved the whole surface over with common bricks, leaving about a quarter of an inch space between for the subsequent convenience of manuring, watering, &c. So pleased were we with the treatment we had applied to the first house, that we decided to continue the same through the others; nor did we even stop at that, for we continued the same renovating and bricking process to the outside borders as well. The Peach borders, inside and out, were also subjected to precisely the same treatment. This work was begun and finished in May, 1891, and as time wore on, I had many a look to see whether any rootlets were making their way towards the surface. During the autumn of that year I was sufficiently satisfied that the roots were vigorously at work, and thoroughly enjoying themselves. The young wood and leaves also showed very perceptibly that the process of resuscitation was cleverly at work, and my hopes were naturally raised to the anticipation of what might be the result of another year's growth. During the early spring of this year, and of the further portion of the year already gone, the Vines, from the extraordinary vigorous growth of wood, dark green leathery leaves, large luscious berries, black as sloes, and with a thick coating of bluish-black bloom, all bearing proof abundantly to show that the Vines, literally speaking, have been masterly stoked, and that they have got their steam thoroughly well up.

The weight of fruit on these Vines, together with their colouring, is at this moment a sight well worth seeing, and when seen, one to be remembered. Besides the help from the dressing of fresh loam and Clovenford's manure, the top covering of bricks formed not, perhaps, the smallest portion of the quota which led up to such general and complete success. To begin with, they effectually prevented any over-industriously inclined young gardener, with the mistaken idea of making his place look tidy, from taking a fork and constantly loosening the borders, thus preventing any chance of the roots ever coming to the surface, to feed and ramify as in nature the manurial nitrogens placed there for assimilation. The bricks, too, from their moisture-absorbing quality, form a famous damping medium. On hot days water poured with a rose on those bricks produce and maintain a most salubrious growing and spider preventing atmosphere.

We have for many years been in the habit of covering the surface of our Melon beds with bricks, with the happiest results.

Although I have written thus strongly recommending bricks as a covering medium for fruit-tree borders, I am far from presuming to say that there is anything very new in it; for I distinctly remember seeing quite forty years ago, fruit-tree borders covered, not with bricks, but with stone, perhaps, because they only were obtainable. When the borders were dry, the water was poured all over the stones. As far as my experience goes I like bricks best, they are absorbent of moisture, and they can be placed neatly. Besides which, they can at all times be comfortably walked upon, or a pot or plant placed level on them without trouble. The bricks used were all old ones, from old sanitary culverts, which had been disused and dug up. They lay in an immense stack close by, and suggested themselves being appropriated to our use. Much more might be written on this subject, and of the various material used with more or less success.

Are not Apricot trees longer lived and more fruitful when grown on the walls of a cottage with their roots under the pebble-path which leads by? Perhaps others may be induced to give their experience of what they may have done in this line. I feel strongly, that although we may not be altogether on a new track, we are, at any rate, on a safe one, and one that, if perseveringly followed up, may lead to even greater success than that which, I am pleased to say, it has brought to me. *W. Miller, The Gardens, Combe Abbey.*

CHRYSANTHEMUMS.

RIPE VERSUS UNRIPE WOOD.—I know amongst a certain class of cultivators for large blooms there has been an idea that the ripening—or what is perhaps a more correct term to employ, maturation—of the wood exists in name only; but as time rolls on, and none but the best formed flowers obtain the desired goal in the competitions, it is dawning gradually upon the sceptics that the maturation of the growth of Chrysanthemums is after all a very important phase in their successful cultivation. It is in the incurved section where imperfect maturation is most felt, because it is on the perfect incurving of the petals that success or otherwise depends, and it is not the extraordinary size in width only that is the desideratum to strive for. Depth and solidity of the blooms are absolutely essential in incurved blossoms, and these, let me impress upon learners, cannot be had from plants with immature wood. Ill-ripened branches will produce flowers large enough in diameter, but they lack depth and form. Blooms from perfectly-matured plants are always deeper in the growth of the florets and firmer in "build," as it is called; while those from unripe growths are devoid of depth, and contain a number of ill-shapen florets, in some instances without any semblance of incurving in the proper manner. There are two sorts of ill-ripened wood: first, those branches which are too succulent—soft sappy stems caused by want of space, air, and light, and by their receiving stimulants of a wrong kind, and in the wrong way; secondly, by forcing the ripening by drought, which contracts the sap-vessels, therefore unduly impeding the free flow of nourishment for the blooms at a critical time. Wood-ripening does not consist in merely hardening the wood, but in storing it with nutriment for the blooms. For instance, one or two doses of nitrate of soda may be given during the season to flush the growth of the plants, but if this method were continued, it would result in soft, pithy growth, which could not mature, and this would be an instance of bad management in maturation. Nitrate of soda is a capital stimulant for Chrysanthemums, but it must be simply to elongate the tissues, and give space for other food.

What I mean by perfectly-ripened wood is, wood that is ripened sufficiently by natural means, as the result of correct treatment throughout the whole life of the plant. Maturation must commence with the infancy of the plant to obtain the best results. Seasons vary so much, that the locality in which growers reside is a very important factor in the production of good or bad plants. Where the locality is high, the air, although much rain may be registered, is drier than in the lowlands, and it is this dry air which precipitates bud formation that gives so much trouble to some growers; this is a case of premature maturity of the wood, which is unable to give the finest flowers. We can regulate and control moisture in the soil, but have practically no power over it in the atmosphere. During a hot and dry summer, the absence of night dews is very much felt in high-lying districts, and tends very much to over-ripening or contracting of the sap vessels.

When the wood is pale green in colour, instead of brown, and the growth is soft and gross, a want of maturation is evident. Some growers set too much store on plants with extra thick stems and gross green leaves. These are, perhaps, pleasant to look upon during the summer by the uninitiated, but when the test is applied, and he looks for perfect blooms, they are generally missing. I have a strong remembrance of a case in point. A very enthusiastic gardener and cultivator of Chrysanthemums on the south side of London had exceedingly strong plants during the year 1889. Calling upon him one day in August, he was very proud to exhibit to me his prowess in having made his plants as big as possible. I expressed the opinion that they were too much so, because they lacked the necessary signs of coming maturity. The experience gained by the individual in question that season will never be forgotten,

because with all his plants the prizes won during that year were extremely few in number—not one, I believe, for incurved blooms.

I will now point out some of the causes of the want of maturity in the branches, and advise as to the best means of obtaining that essential. The greatest of all faults is that of not making the soil firm enough in the pots, particularly at the last potting; under such conditions, the roots ramble quickly into the soft soil, and the growths are soft and devoid of that hard wood-like character that is so desirable. Using soil of too rich a nature, and the excessive application of stimulants, such as nitrate of soda (as previously mentioned), induce an undesirable luxuriance of growth.

Overcrowding the plants is another common source of badly-ripened wood. The stems under

FIG. 35.—URCEOLINA PENDULA (AUREA), FLOWERS
YELLOW: SEE FIGS. 31 AND 36.

such conditions grow weakly, and the leaves are imperfect. A free circulation of air amongst the plants, with full exposure to the sun, contributes powerfully to substantial growth. There is no such thing as growing the plants very strong, and ripening them suddenly. By the time the plants are in bloom the wood should cut almost as hard as Oak, and the colour of the bark should be rich brown with a rough uneven surface. The leaves on such plants assume towards September a bronzy appearance, though some varieties indicate this character more clearly than others. The way to obtain perfectly-matured plants is to allow sufficient space between the plants at all stages of their growth, from the time the cuttings are rooted until the plants are housed. If there is any doubt about being able to do this, owing to want of space, the remedy is to grow a less number of plants, and thus do them justice. The plants should be arranged thinly out-of-doors during the summer in an exposed situation, but protected from south-westerly winds, which at times do much

towards bruising the leaves, which is injurious to the plants, even if it does not break them entirely off. The shoots should be tied out thinly and securely as growth progresses; all superfluous side-shoots should be cut off as fast as they grow, as they not only rob the plants of some energy, but impede the penetration of light and air.

Firm potting is absolutely essential in all stages. In soil of a light character it is hardly possible to pot too firmly; but it is not so necessary with heavier soil, as the water will not percolate so freely, and should the drainage become defective, trouble may ensue through the soil becoming waterlogged. I prefer to use a blunt stick at the final potting, the soil can be put into its proper position so much more readily than in any other way.

When the plants are potted firmly, the growth is not so rapid early in the season, but it is rendered solid and firm as growth proceeds, and is more likely to mature in a wet autumn. The soil should be enriched according to the natural state of the loam in the neighbourhood, as this forms the principal part of the compost.

Instead of making the soil too rich, it is better to apply stimulants more freely afterwards, according to the state of the growth made and to the condition of the weather. If this be damp continually, the atmosphere will be laden with moisture, and less stimulative food will be required. Some persons think that Chrysanthemums cannot have too much water at the roots, but that is a mistake; they will stand more drought than many think. What I mean by drought is, that state of dryness which precedes the flagging of the leaves of plants for want of moisture. It would not be wise for any cultivator to allow their plants to get into this state at any time, as the lower leaves would be likely to drop afterwards.

In conclusion, I would impress strongly upon learners in Chrysanthemum culture for large blooms the absolute necessity for extra attention in the maturation of the wood of the plants, and more especially to the incurved section; and it is in this that the ability of a person in Chrysanthemum culture will be tested. *E. Molyneux.*

TREE-GROWTH IN 1892.

THE peculiar and unusual nature of the present season has had a remarkable influence on the growth and leafage of many trees and shrubs, most of which have made unusually long growths, and leafage of the richest description and in great profusion. Coniferous trees are, perhaps, most noticeable, those growing in favoured situations having already in many districts added 2 feet to their height, and spread laterally in proportion. Turn where one will, the beauty and grace of the Larch this season are particularly noticeable, the healthy hue on the peagreen foliage and weeping branch-tips caused by the extraordinary growth being unusually beautiful. Scotch Firs, too, as also, indeed, the Austrian and Corsican Pines, have nearly doubled their usual annual growths; and should we have a good season to ripen off these growths before they are subjected to frost, it will be a matter of the greatest moment. Sickly Coniferous trees do not seem to be at all abundant, though for all the growth they have made, insect pests would seem to be generally more abundant than usual, this probably owing to the damp warm weather which has been so beneficial to the growth and development of the trees.

Amongst the newer and rarer Conifers, nearly every species have benefited from the nature of the weather during the past spring and summer. Nordman's Fir (*Abies Nordmanniana*), and the still more beautiful *A. nobilis*, look unusually happy. Turning to hard-wooded trees, much the same may be said as of the coniferous section, the rich glossy leafage speaking for itself. Beech on the chalk, Oak on fairly stiff soil, Chestnut where good vegetable loam is present, and Birch amongst the rocks—all look the picture of health, and to a greater degree than usual.

The flowering of trees is this season remarkable, the Spanish Chestnut being literally covered

with its curious yellowish-white blossoms, while the Horse Chestnut was not one whit behind it, whether for beauty or quantity of flowers produced. Worthy of unusual notice is the scarlet-flowered Horse Chestnut, and which during the past season flowered with unwonted vigour. The Buck's Eye (*Pavia macrostachya*) is just now spiked with flowers, and is a very handsome lawn shrub or small-growing tree. Acacias, too, never showed to better advantage, and we had to chronicle the flowering of several of the rarer and finer kinds. The prickly-flowered section is well worthy of extended cultivation, and few, if any, can beat the good old false Acacia (*Robinia*), for beauty, quantity, or purity of flowers. Some of Limes, notably the large and silver-leaved, have been studded with their sweetly-scented flowers that are so attractive to insect life; while the equally sweet flowers of the Maples have been freely produced.

Magnolias, including such uncommon kinds as the Umbrella (*Magnolia umbrellata*), the Cucumber tree (*M. acuminata*), *M. stellata*, *M. Campbelli* [?], and *M. conspicua*, have flowered with the greatest freedom, some of those of the Umbrella tree being of great size and substance, while many of the leaves exceeded 18 inches in length. The Manna Ash (*Fraxinus ornus*), kept up its usual reputation for beauty and quantity of flowers, and is a small-growing tree that cannot be too often recommended. *Ailantus glandulosa* (the tree of heaven) is a distinct ample-leaved tree with flowers plentifully produced, though not of pleasing colour nor appearance. The Sumachs follow in the same wake, both as regards flowers and leafage, these being produced during the present season in great plenty. *Catalpa bignonioides* (the Indian Bean) promises well for flowers, and the leaves are faithful to their size, and of the curious bronzy hue for which the tree is remarkable.

Amongst our native trees few have been more attractive or, indeed, are so at present, than the various species of *Pyrus*, the abundance of flowers and unusually coloured leaves making them the favourite of all. The Beam Tree (*P. Aria*), and the Rowan or Mountain Ash (*P. aucuparia*), are, indeed, handsome species, the finely-cut leaves and unusual wealth of rosy berries of the latter, and ample foliage of the former, and which with the least breath of wind reveals the cottony-white of the undersides, rendering them objects of interest wherever they are growing. But the Gueldres Rose (*Viburnum opulus*)—not the round *Dahlia*-like flower of our gardens, but the true old English species with single flowers—has been weighted down with the great flat head of pretty whitish flowers, the most delicately-tinted pinky berries just now taking the place of these, and which for the next two months will render the plant without a rival for beauty of fruit and intensity of its autumn garb. I oftentimes wonder that this native shrub, that certainly has no superior, whether for beauty of foliage, flowers, or fruit, should not be more commonly cultivated, for the freest-flowering foreign species, be it ever so decked with fruit, is far cast in the shade by the marvellous beauty of this neglected native shrub. But neglect of the plant is not to be wondered at when we find some of our botanist-gardeners stating that the plant is not in cultivation—curious, that in nine cases out of ten, lovers of the most desirable trees and shrubs show the greatest ignorance regarding our native wildlings.

Rather stiff and starch is Wayfaring tree (*Viburnum lantana*), but when the flattened heads of white flowers are at their best in July, the shrub or rather small tree is visible for a long distance away. The stiff hoary leaves, deeply veined as they are, have an unusual and rather peculiar appearance, while the fruit, if left alone by birds, is of an enticing kind, and fully produced.

Clambering for sometimes fully 20 feet in height over trees and hedges, the pretty Traveller's Joy or Old Man's Beard (*Clematis vitalba*) may now, in the chalky regions particularly, be seen in plenty. The damp and hot season seems to have been all in its favour, the long and strong growth, the intense hue of the leaves, the unusual quantities of flowers, and the show for fruit being unusual. Everywhere the

common Elder has been noted this season as being wonderfully floriferous, the broad and flat head of rather sickly-scented flowers in many instances quite hiding the leaves from view. Spiræas generally are wonderfully vigorous, and the flowers rich and plentiful.

Second growth of the trees is by no means uncommon, and a pretty effect is produced amongst the Oaks by the light Pea-green suffused with pink of the second shoots, and the dark almost Yew-green of the older branches. Even the Sycamore has put forth a second growth, and some of the prettier Maples—to wit, *Acer colchicum rubrum*—are tipped with the brightest vermilion. Christ's Thorn (*Paliurus aculeatus*) has been flowering well; so also has the curious Bladder Senna (*Colutea*) and the Bladder-nut (*Staphylea pinnata*).

American shrubs, too, are not one whit behind, for some of the *Andromedas*, the *Kalmias*, the *Arbutus*, and the *Azaleas* have flowered with unusual freedom of late. *Rhododendrons* of most kinds have been unusually floriferous, and many of the less hardy kinds have done better than usual. Altogether, vegetation, speaking widely, is strong and vigorous, and (particularly that of trees and shrubs) more promising than is usually the case at this time of the year. *A. D. W.*

BOOK NOTICE.

LA TRUFFE, &C. Par Ad. Chatin. Paris: Bailliére. [*Truffles, their Culture, &c.*]

The venerable Professor Chatin has here gathered into one book the information he has obtained during many years of observation and research. In successive sections he deals with the history and the botany of the various species of Truffle, then proceeds to the discussion of the conditions favourable to their production, their cultivation, collection and sale, their medicinal and alimentary properties, and their chemical composition. In fact, nothing relevant seems to be omitted, not even a chapter on the law as it affects Truffle hunters. A bibliographical index, a full table of contents, an excellent alphabetical index, and fifteen excellent coloured plates, showing the details of organisation complete, a monograph for which no terms but those of praise are adequate. The presence of wild Truffles is indicated to the experienced hunters by peculiar appearances of the soil and by the presence of certain flies. Truffles have been cultivated for a long period in various parts of France. Direct culture by the introduction of spawn or of soil permeated with it in appropriate localities in woods or in clearances has been tried with success, but financially speaking, the results have not been satisfactory. Indirect cultivation resolves itself into this: "sow acorns," with this important addition—in a district known to produce Truffles, else you may get Oaks, but no Truffles. A climate unsuited for Vine culture is also unfitted for Truffle culture. The acorns are sown in spring on lightly dug soil, kept surface-hoed, especially in dry weather. After two or three years the seedling Oaks should be thinned out, and this process should be repeated from time to time to obviate the shade, which is found prejudicial to the production of Truffles. Moderate pruning or topping is desirable when the Oaks are four to eight years old. For full details the reader should refer to the book itself, as the process is long and capricious; but in the meantime Vines and cereals may be cultivated on the same land between the rows of Oaks. Where the operations are successful the financial results are very satisfactory. A company established at Arles even promises dividends of 70 to 79 per cent. A moderate estimate is a total cost of 640 francs per hectare during four years, at which time the Truffles should pay their expenses, and part of the capital sunk in their culture. At the eighth year the capital will be all repaid, and the profits will increase each year, the net gain during from fifteen to twenty years being 600 to 1000 francs [per hectare?] *M. Chatin's* book

abounds in details, but his style is so lively and attractive, and his fairness and accuracy in putting the facts before his readers so obvious, that the perusal of his pages will well repay even those, who do not intend to grow Truffles.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

THE weather during the past two months has not been what we might expect for summer, and sunshine has been very deficient. Fortunately, it has been more plentiful in some districts; for dull weather at this season is most unnatural for Orchids, and especially for *Dendrobiums*, which I think have suffered thereby more than any other genus, and if they have not been kept well up to the light and extra attention paid to them, they are almost certain to suffer. A sharp eye must be kept on the *Cattleyas*, and those of *C. gigas*, *C. Gaskelliana*, and *C. Dowiana* that have flowered should have the sheaths removed or split open to the bottom, as water is apt to collect there, thus causing the sheath to rot, which will (and more especially in dull weather) affect the pseudobulb, the newly-made leaf falling a victim first. In such unseasonable weather, also, when perhaps the houses are not sufficiently ventilated, thrips seem to breed and increase at an alarming rate, and they are very fond of *Cattleya Skinneri*, *C. Eldorado splendens*, and *C. Bowringiana*; and if the last-named plant is attacked, weak tobacco-water must be applied before it is possible to dislodge them. If any more re-potting is contemplated this year among the *Cattleya Mossie*, *C. Mendelii*, or *Lælia purpurata*, and *L. elegans*, it should be done at once, as it will soon be too late to repot such plants, for they are now actively making new growth. *Lælia purpurata* is a grand Orchid, and does well in most places; but, like the *Cattleyas*, it must be kept in good condition at the root. A shift may not be necessary every year, or for the matter of that every two years, but just when they may be found to want it on an examination of the roots. I might add, however, that it is safer to repot a year too soon than to delay the operation after it is needed.

GENERAL WORK.—Where it has been necessary to use permanent shading, such as *Summer Cloud*, it should now be, if not wholly removed, considerably reduced by having part wiped off. *Catasetums* and *Mormodes* should now be removed to the Mexican-house, and there rested in full light. Continue to watch closely the *Dendrobiums*, and those that have finished their new pseudobulbs must be taken into a cool but sunny house, and water gradually withheld. This applies to the species that flower in spring and require a long rest, but those that flower immediately the growth is finished must not be removed until they have flowered. *D. formosum giganteum* is one of the earliest of these, and is now coming into flower, and a beautiful Orchid it is—one well worth growing in large quantities, but it must be grown in very small pans to keep it in good health. *D. Phalæopsis Schroderianum* is another that flowers at once, and now that we can see the lovely varied forms, it is seen that this plant has not been over-estimated. *Cælogyne cristata* will now take a plentiful supply of weak manure-water, taking care to keep it from the foliage. *Calanthes* (deciduous) are also benefited by manure-water, especially as they are now pushing up flower-spikes; keep them well to the light. Watch the young and tender spikes of *Aërides Lawrenceana* and others that may be showing bloom, or cockroaches and slugs may do much mischief. *Cattleya Eldorado*, *C. superba*, and *C. Aclandia*, which have been growing in heat, must be removed after flowering to the *Cattleya-house*, and given a warm and light position, where they will rest. Attend well to damping and ventilation, as advised in previous calendars.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

GENERAL WORK.—Where a variety of vegetables are required in the early part of the year, no delay should have occurred in sowing Cabbages, Onions, and Spinach for early winter use; but another sowing of Cabbage may yet be made if a deficiency is likely to occur, or if those from the first sowings are too forward. The hoe must be kept going constantly among the growing crops; the advantage of frequently going through the

grounds now to cleanse it will be very great, as later on there will be difficulty in doing such work. The land should be cleared of all vegetables as soon as the crop is gathered; there is much loss by allowing these to remain on the ground. In many cases the refuse may be burned on the spot, and the ashes spread over the ground; there is no reason whatever why this department should look worse than others, if such attention is paid it. The digging of all ground that has been cleared should be proceeded with. Trenching and manuring will be necessary in many gardens where constant cropping is imperative. The trenching of the ground is often left till later in the year, when the ground is required for immediate use, and it is often found that the operation is then impracticable, consequently the crops suffer. Ground occupied by spring-sown Onions will soon be vacant, and such ground is often available for the early spring Cabbage; but if at all infested with grub or maggot, it will require a thorough cleansing. Give a liberal dressing of fine gas-lime, allowing it to remain on the surface some little time before trenching; and apply plenty of wood-ashes, charcoal refuse, or soot after the trenching, by lightly forking it into the soil, going over the ground several times a week with a fork or deep rake, to cleanse the soil and destroy the grub.

ONIONS.—Spring-sown Onions will in some instances require bending at the neck, to prevent running. These should be gone over, and the tops all laid one way. When ripe, they should be harvested. I do not like them to remain too long on the quarters, but, if possible, would house them in a cool shed or house, where they can be looked over in wet weather, and stored in their winter quarters, this being a better plan than bunching them.

SHALLOTS AND GARLIC need similar treatment at the earliest opportunity.

HERBS should likewise be cut and dried in a cool dry place, for winter use, and, when ready, tied up in neat bunches and hung in a cool shed, taking care to have a good stock of the most useful kinds. Chervil should also be sown for autumn and winter use.

PARSLEY.—A good bed sown now will come in serviceable in the spring, care being taken to sow thinly in thoroughly-prepared soil. Seedlings should also be transplanted on a warm border from previous sowings. These will give a good return if well looked after, and a frame or shelter can be placed over the crop later, and there will then be no lack of garnishing material in severe weather. Parsley that is to stand during the winter should be well thinned, and, as growth increases, the tops cut, to get a late growth; watering or dressing with soot is very beneficial.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

GREENHOUSE PLANTS.—*Vallotas.*—These will now be throwing up their flower-spikes, and should be assisted with weak manure-water occasionally. After they commence to open into bloom, remove them to a drier and cooler house, so as to prolong their blooming period.

Primulas.—Early-sown plants now occupying 3 or 4-inch pots, and are in want of more root-space, may be moved into others two or three sizes larger, according to the size of the plants. Later-sown plants, if still in boxes or pans in which they were transplanted, should be potted off and placed in a cold frame, well up to the glass at the back of a north wall, keeping them rather close until the young plants get established, when more air should be given.

Cinerarias.—The earliest batch of these should now have their final shift into 6 or 7-inch pots, which will be quite large enough for plants intended to bloom before Christmas. Younger stock should be potted on as growth proceeds, never allowing them to become pot-bound, or receive the slightest check.

Fancy and Show Pelargoniums.—These plants may now be cut back to a couple of eyes, and be kept much drier at the roots until they commence to break. If the weather be wet after the plants are cut back, put them in a cold frame, and when they have broken freely, they should be put into smaller pots, first removing all the old soil, and cutting back the strongest of the roots. Keep them in the frames, and syringe them every bright afternoon, so as to encourage them to make fresh growth. A batch of cuttings may be put in, choosing the strongest shoots. Use a sandy compost, and insert four or five in a 4-inch pot.

Bouvardias.—These should also be shifted on as

soon as they are ready. Place a neat stick to each one, to which the shoots should be tied as growth proceeds.

Seedlings of herbaceous Calceolarias and *Humea elegans* should be pricked off as soon as ready, and young *Salvias* which were struck this spring should be moved into the pots in which they are intended to bloom; also *Fuchsias* to bloom late must now have their final shift, using a good rich compost.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

TOMATOS.—If spring plants of Tomatos are desired for pot culture, or for planting in borders early next year, the present is a good time to set about securing the stock. This can be done either by sowing seeds of approved varieties, or by propagating (by cuttings) free-fruited forms of those now in bearing. In either case use a rich open compost to fill the body of the pots, and surface with a mixture of leaf-mould and sharp sand. For seeds 4 or 5-inch pots will be best, and the mould may be rather loose. Sow thinly, cover lightly, well water, and plunge in brisk bottom-heat till the young plants appear. A piece of glass placed over the pots will aid the germination of the seed by preventing the escape of moisture, but this should be removed whenever growth shows itself above the soil. Gradually inure the plants to light and air, and pot off when large enough to be conveniently handled. At this, and all subsequent shifts, however, make the soil firm. For cuttings thumb-pots are the best to employ, and the soil should be thoroughly firm; one cutting in each pot will be enough, as they root freely if given a temperature of from 60° to 70°. Shade from the noontday sun, and be careful that moisture is afforded the roots, and also that the atmosphere is moist. As soon as the cuttings have made sufficient roots, remove them to a warm dry airy structure, and transfer them to larger pots a few days afterwards. Aim at securing sturdy growth and freedom from parasitical pests, by exposing the plants to as much sunshine as possible, and maintain a moving air in the house.

PINE SUCKERS.—Get a hotbed in readiness for Pine suckers by the beginning of September. Stable litter and half-decomposed leaves, in the proportion of two of the former to one of the latter, will make a suitable bed. These materials should be well mixed, and frequently turned before finally making it up. To prevent the bed becoming too hot, tread it well, and cover it loosely with 6 or 8 inches of sawdust, tanner's bark, or other such material, in which to plunge the pots.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

HERBACEOUS PLANTS.—The present is a good time to note any alterations that may be considered desirable in the redistribution of those plants in the borders and beds next spring, or before, whose respective heights or shade of colour of the flowers are incongruous when viewed in connection with their surroundings. Among the plants most worthy of notice now in flower may be mentioned *Rudbeckia Newmanii*, *Senecio doronicum*, *Hyacinthus candicans* (the fine tall spikes of this hardy bulbous plant, studded with white bell-shaped flowers, show off to great advantage among other flowers now); *Achillea rosea*, with its compact heads of pretty Verbena-like rosy-crimson coloured flowers, showing well above its own pretty dark green Fern-like foliage; *Helianthus decapetalus*, *H. giganteus*, *Gaillardia grandiflora*, *G. lutea*, and *G. picta*; *Galega officinalis*, Lemoine's hybrid *Gladiolus*, planted in groups are very telling in effect. Liliiums of the following varieties are doing well, namely, *L. auratum*, *L. longiflorum*, *L. tigrinum*, *L. tigrinum flore-pleno*, *L. speciosum album*, *L. albo marginatum*, *L. speciosum rubrum*, *L. Batemani*, and *L. atrosanguineum*. Should aphid effect a lodgment on the plants, a slight dusting of tobacco-powder in the evening when the foliage and flowers are damp, will prove effectual. Syringe with clean water the following morning to cleanse the plants from the effects of the tobacco-powder. Among annuals worthy of more extended cultivation may be mentioned *Godetia Lady Albe-marle*, *G. alba*, and *G. Lady Satin Rose*, *Malope grandiflora*, *Salpiglossis*, *Nigella damascena*, *Zinnias* (double), *Coreopsis Drummondii*, *C. tinctoria*, and *C. coronata*, *Alonsoa Warscewiczii compacta*, having bright scarlet Phlox-like flowers and dark green serrated leaves; *A. linifolia*, with scarlet flowers and long narrow leaves. These two showy and very useful annual plants are not met in gardens so often as they undoubtedly deserve to be—in fact, they seem to be but little known by gardeners gene-

rally. They should be noted among the good things that are to be grown next year. Continue to tie up flower-stems that require support, and train climbers over the space allotted to them, the points of the shoots being allowed to hang somewhat loosely. Rock plants should be kept within their limits; this remark applies to tall, strong-growing ones, as each plant should be allowed due space to develop and show its special features to advantage. Cut out all decayed flower-stalks and leaves from among the fresh foliage, and gather seeds of choice flowers as they ripen.

ARRANGING THE COLOURS FOR 1893.—Now that the floral picture for the present year is at its best, any defects or contemplated alterations to be made in the composition of the beds next year should be noted on a plan of the garden made for that purpose, entering thereon the names of the plants which are to be put into each bed next summer, and propagate the several kinds and varieties in proportion to the arrangements thus made; then there will be no time lost in spring wondering what we shall put in this bed and what in that. The necessary quantity of each kind and variety of plant is previously known and propagated accordingly, with a liberal allowance for any mishaps that may occur before planting time arrives. The same remark applies to spring bedding, that is, in determining in spring when the flowers are at their best what subjects are to be planted in the several beds the following autumn.

GENERAL WORK.—This will consist in clipping Box edging, Thorn hedges, &c.; the latter are not always cut into so good a shape as they might be. In some cases it is necessary to cut Yew hedges square at sides and top, so as to be in character with surrounding objects, but in a general way they should be cut into a rounded point on the top, sloping gradually from mid-height of hedge, giving a section representing a semi-elliptical figure. Hedges thus cut, as they are on this estate, and in most of the nursery-grounds in and about Edinburgh, and further north, are always thick and well-furnished from the ground, and look well.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Moreworth Castle, Maidstone.

APRICOTS.—These should be gone over once more, and all the sub-laterals pinched back, and the points taken out of all the main shoots that have reached their limits. Keep a sharp eye on all young trees, taking care that all the leaders for the frame work of the future tree be made fast to the walls before they get bruised or broken by wind. Old trees bearing heavy crops of fruit now ripe or ripening should be gone over daily, and the best and most forward fruits taken off. These should be with great care taken to a cool fruit room; the finest should be used for dessert and the others for the kitchen. The roots are dry, and mildew is certain to make its appearance, but so long as there are unripe fruits on the trees, little can be done in the way of checking its progress by the use of flowers-of-sulphur; but water in abundance must be supplied to the roots. Should the soil be hard and baked on the top, loosen it with a fork, and then spread on some manure, to be followed by a copious watering till the soil is thoroughly saturated to a good depth. Trees whose fruits have been gathered, or those which have borne no fruit, should be thoroughly washed a few times weekly in hot weather, at the same time attending to the root requirements, so that the trees may make fine stout wood and fruit buds for next year, and if mildew should put in its appearance apply sulphur when the foliage is damp.

PEACHES AND NECTARINES.—These set more fruit than one could have expected. The Dymond, as usual, has done well, together with Early York, Walburton's Admirable, and most of the earlier. The later sorts should have strict attention in removing aside the leaves which overhang the fruit, and so fully expose them to the full sunshine. Three or four times a week make good use of the garden engine in hot weather. Red-spider should be kept in check, for, if once this pest gets the upper hand, the fruits will be both small and flavourless. Washing repeatedly overhead will, in a great measure, keep the trees free and clean. The soil about the roots should be thoroughly moistened with tank-water, and free applications of liquid manure. Early trees, whose fruits have been cleared, should be thoroughly syringed with a mixture of Gishurst Compound or soapy-water. It is far better to wash the trees with a weak solution a few times, than use strong mixtures in the hope of one dressing being sufficient.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see. Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

TUESDAY,	AUG. 23	{ Exhibition of Begonias, Apricots, and Plums, at the Royal Horticultural Society's Gardens, Chiswick (two days).
WEDNESDAY,	AUG. 24	{ West Gloucester Horticultural, at Kingswood. Northern Botanical and Horticultural, at Newcastle (three days).
THURSDAY,	AUG. 25	{ Droitwich Horticultural, Kenilworth (three days).
FRIDAY,	AUG. 26	{ Great Fruit Show, at the Exhibition, Earl's Court (two days).
SATURDAY,	AUG. 27	{ Co-operative Show of Flowers, Fruits, and Vegetables, at Crystal Palace.

MEETING.

TUESDAY,	AUG. 23	{ Conference on Begonias, Apricots, and Plums, at Chiswick (two days).
----------	---------	--

SALES

MONDAY,	AUG. 22	{ Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms, at 11.30.
WEDNESDAY,	AUG. 24	{ Dutch Bulbs, at Stevens' Rooms.
THURSDAY	AUG. 25	{ Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms, at 11.30.
FRIDAY,	AUG. 26	{ Orchids from Messrs. Charlesworth, Shuttleworth & Co., at Protheroe & Morris' Rooms, at 12.30.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—61° F.

The electric light and the culture of Lettuces.

It is long since we advocated the use of the electric light for forcing purposes, at least on an experimental scale; but our growers have little taste for experiments, and, with characteristic caution, like to see the result of other people's experiments before they embark in them themselves. Well, there have been several such already, and they proved, in spite of some failures, that the matter was quite feasible, but far from remunerative. Now, things have progressed, and one enterprising market gardener of Boston, United States, Mr. W. W. RAWSON, asserts that the electric light hastens the maturity of Lettuces by 10 per cent., and says that the gain produced upon one crop pays for running the lamps during the entire winter. He calculates that there is an average gain of five days for each crop, or a total saving of fifteen days during the winter. He also says that the plants "head up" better under the light, and that the quality is superior. "One need only visit these houses," writes Professor BAILEY in *American Gardening*, "in order to convince himself that here is the acme of winter Lettuce cultivation, in which the electric light plays no small part. It will probably become a prime factor in vegetable forcing." Thirteen houses are, we learn from the same source, devoted to this crop, and one of the houses covers nearly a third of an acre. It is so large that the ground inside is ploughed by steam. It is 333,370 feet in outside dimensions, 15 feet to the ridge, 3½ feet high on the south or lower side, and 12 feet on the north side. The glass

panes measure 20 by 30 inches, and is "double thick." Such a house is simply an enclosed field. The plants grow in the natural soil, 3 to 4 inches being removed every year or two, as it becomes somewhat worn or infested with germs of fungi. From this great house Mr. RAWSON takes at one crop 2000 dozen heads of Lettuces, and the heads are twice the size of those ordinarily seen in the markets. All the houses are supposed to grow three crops of Lettuce and one of Cucumber during the year; the first Lettuce crop is taken off just before Christmas, the second from February 14 to March 1, and the third about April 1. Then the Cucumbers are started, and another crop is off by September or October, in time to give room for the winter Lettuce. In all the houses steam-heat is used. "Hot water is not applicable to such large plants [houses]." The light is produced by three 2000 candle-power arc lights, shining all night throughout winter. Some of our routine practitioners will look on all this as an American tale, but our authority for it is Professor BAILEY, one of the foremost horticulturists in the States, and the editor of *American Gardening*, in which publication illustrations and full details are given. This question of the use of electric light for forcing purposes has survived the initiatory period of ridicule; it is still ignored by our cultivators; but we trust before very long we shall see the success of Mr. RAWSON repeated here, and then we expect to be told that this sort of thing was known long ago. When we get a properly-equipped school of horticulture, and teach something beyond routine, we may expect our progress to be quicker, or else to succumb utterly to foreign competition.

URCEOCHARIS CLIBRANI.*—Some short time since Messrs. CLIBRAN favoured us with a flower of a hybrid raised by them between *Urceolina pendula* (alias *aurea*) and *Eucharis grandiflora* (alias *amazonica*), which was so beautiful and so interesting that we requested them to furnish us with materials for an illustration, to which request they kindly assented by sending Mr. W. G. SMITH the specimen whence the illustration (fig. 36, p. 215) was taken. The leaves are broadly ovate acute, the numerous stalked pure white flowers are borne in umbels on the extremity of a scape, each is ascending or horizontal, about 2½ inches long, with a very slender, often curved, cylindrical tube, dilating into a cup-shaped limb, less than half the length of the tube. The six segments are of about equal size, ovate, slightly acute, and spreading. Stamens six, inserted at the throat of the tube, nearly as long as the segments; filaments with a long linear petaloid appendage at the base; anthers depauperate, versatile. Ovary ovoid, oblong obtuse, deeply 3-lobed, 3-celled, with numerous superposed ovules in each cell; raphe next the placenta. Style as long as the perianth; stigma shortly three-lobed; capsule? bulb? The flowers are thus curiously intermediates between the two parents in form. They are borne on ascending stalks as in *Eucharis*, not pendulous as in *Urceolina*; but the ovary is three-lobed as in *Urceolina*, not globose as in *Eucharis*. The slender perianth-tube is also more like that of *Urceolina*, whilst the limb is intermediate between the bell-shaped limb of *Urceolina* and the funnel-shaped *Eucharis*. The appendages or barren branches of the stamens are more distinctly marked than in either of the parents. So much for the structural features of this interesting plant. As to its value for decorative purposes—we may safely allow the illustration to tell its own tale. A few flowers were shown by Messrs. CLIBRAN, of Oldfield Nurseries, Altrincham, on July 26, at the Royal Horticultural Society, under the name of *Eucharis*

* *Urceocharis*; *Musl.*, Gen. Nov., arte cl. Clibran inter *Urceolinam* et *Eucharidem* confectum. M. T. M.

Clibrani (see *Gardeners' Chronicle*, July 30, p. 138). We hope those gentlemen will excuse us for adopting a name more in accordance with the nature of the plant. In order that a comparison may the better be made, we give illustrations of *Urceolina pendula*, one of the parents (fig. 35); and of *Eucharis Bakeriana*, which is nearly allied to *E. amazonica*, and of similar form (fig. 34).

A FLORAL HOROLOGY.—Among the French inventions of the past few weeks, and described in a recent number of *Le Figaro*, is one to which the attention of the readers of this journal may be called. M. DEBERT, who describes himself as a gardener, terms his new invention an "Horloge des Fleurs," and he has certainly worked out an exceedingly ingenious contrivance, and which, like so many similar things, is perhaps a good deal easier to do on paper than elsewhere. M. DEBERT traces out a piece of ground, which may be perfectly level or on a slope, a large circle of 10 mètres in diameter, divided like a sun-dial into the twelve hours of the day. This circle is transformed into a carpet composed of grass and ornamental-leaved plants of different colours, whilst the figures of the hours are formed of plants with pale-coloured leaves, the background being in sombre colours. In the centre of this circle a subterranean excavation contains the machinery of a clock, on a very large scale, and worked with the aid of a reservoir of water preserved at a constant level. The clock-work strikes the hours and half-hours. At last, two large hands, each of from 4 to 5 mètres in length, and covered with flowers and ornamental-leaved plants, are put into motion by the mechanism in the centre, and the time of the day is thereby indicated, and, naturally, may be detected a long way off. It goes without saying that M. DEBERT proposes to erect examples of his floral horology in all sizes, from dimensions necessary for large parks to those for small villa gardens. The chronicler in the *Le Figaro* says that he will be very much surprised if in the course of a year the railway traveller does not see in the midst of the localities through which the train takes him the pleasing spectacle which these "horloges des Fleurs" will afford. It will certainly afford a much-needed variety to journeys which are so monotonous and tiresome. But the more sober-minded Englishman will not be so sanguine as his neighbour across the Channel. The idea is certainly ingenious, and to M. DEBERT is due the credit of having worked it out in a very clever manner. But the age is not given to fantastic displays in horticultural possibilities. Had the idea been formulated when the Dutch or other formal fashions in gardening had a vogue, no doubt the inventor would have made a big fortune. As it is, we fear all his ingenuity is wasted.

PROSPECTS OF THE SEED CROP IN HOLLAND.—

It is well known that large breadths of agricultural and garden seeds are grown in the Netherlands. Advices from one of the most important seed producing districts—Enkhuizen—show that there, as in England, the harvest will depend largely on the prevalence of dry sunny weather during the next two months. Cauliflower is in full bloom and decidedly promising. Cabbage, Savoys, and winter greens look satisfactory on the whole, but the caterpillar has injured them in some parts. Swedes look well. Turnips and Mangels are by no means favourable. Beets promise well at present. Spinach and Peas are satisfactory; but Radish a poor crop, with the exception of the white Spanish. Onions are good. Beans and Cucumbers stand well; but want warm weather. Carrots look satisfactory; and Parsley, which promises to be a thin crop in this country, is represented as being very good. The next six weeks will be an anxious time for the seed grower at home and abroad.

TREAT TO EMPLOYÉS.—On Friday, the 12th inst., Messrs. J. LAING & SONS, with about eighty of their employés, spent a pleasant day in Folkestone.

FIG. 36.—URCEOCHARIS CLIBRANI, FLOWERS WHITE: EUCHARIS. (SEE P. 214)

A dinner was presided over by the senior member of the firm, Mr. JNO. LAING, whose health, and that of Mrs. LAING, was proposed and received with enthusiasm.

THE GREAT FRUIT SHOW AT EARL'S COURT.

—There is every promise, says the *Journal of Horticulture*, of a very fine show of fruit at Earl's Court on August 26 and 27. Intending exhibitors who have not sent in their entries should do so at once. The prizes are excellent. In the first of the forty-six classes, prizes of £12, £9, £6, and £4, are offered for a collection of fruit, not less than twenty dishes. In this collection four varieties of Grapes (two white, two black—two bunches of each variety), two Pines, two Melons, two dishes of Peaches, two of Nectarines, and two of Plums, are required; the remainder to be distinct. In the second, £8, £6, £4, and £3, are offered for twelve dishes, and prizes of equal value are offered for ten varieties of Grapes, two bunches of each. There are eleven classes for Grapes altogether, two for Pine-apples, two for Figs, six for Peaches and Nectarines (grown and ripened out-of-doors), five for Plums, nine for Apples (the first five for outdoor fruit), four for Pears (two for outdoor fruit), and four for Tomatos. In connection with the show a social gathering of the gardeners of the United Kingdom will be held on the afternoon of the 26th, followed by a dinner in the exhibition building, which, with liquid refreshments included, will be provided at 4s. a head. As only a limited number can be accommodated, the tickets will be issued according to priority of application. Dinner at 5 P.M.

VARIATION OF SEED.—M. SCHIRBAUX, by his observations, establishes a relation between the date of unfolding of the flowers and the weight of the seed. Those seeds which are produced from the earliest flowers are, he says, the heaviest, and ripen the soonest. M. SCHIRBAUX'S observations and experiments were made on Clover, Saintoin, Hemp, Colza, Buckwheat, Sunflower, Wheat, Barley, and Oats, the results being uniform. The practical inference is, select the biggest seeds from the finest ears or spikes or pods, as the case may be. M. SCHIRBAUX'S paper may be read in the *Comptes Rendus*, July 25, 1892, p. 267.

MEAT-SOFTENING CUCUMBERS.—A cucurbitaceous plant, having the faculty of digesting nitrogenous substances, like the Papaw, is the subject of a paper by Professor GREEN, in the *Annals of Botany*, July, 1892. Certain ferments, or, as they are now called, enzymes, convert starch into sugar. Of this, diastase is the most generally known. Other ferments soften fibrin and albumen, and it is to their presence that the so-called meat-eating tendencies of Drosera, Nepenthes, Sarracenia, and of the Papaw are due. In the germinating seed of Lupin and of the Castor-oil plant, Professor GREEN has found a similar ferment, and now adds another in the case of Cucumis utilisissimus, the fruits of which Dr. BONAVIA had noted as having the property of softening muscular fibre like the Papaw. An accident showed that this property is not shared by all the cucurbits, else we should not hear of the indigestibility of the cucumber!

"FERNS AND FERN CULTURE, ETC.," by J. BIRKENHEAD. (HEYWOOD, Manchester.)—This is a little book which ought to have been mentioned before, but it is not too late to commend it to the notice of Fern-growers. The book only contains some 120 pages, but within these limits Mr. BIRKENHEAD manages to give a great deal of sound information on Ferns and their cultivation, the necessary soils and composts, the various methods of cultivation in pots or otherwise, the light, heat, and moisture to be afforded them, the methods of propagation, and other points which justify the title of the book. Lists are given of those genera which require different descriptions of composts—a very useful piece of information for amateurs. Not less so are the instructions given as to potting. The illustrations are numerous, and mostly pretty, but one on p. 60 should be omitted in future as not worthy of

its fellows. It is a book that no amateur can well dispense with.

STOCK-TAKING: JULY.—The returns for the past month of the imports and exports exhibit the features which had been made the subject of not very difficult forecast—an increase in the value of imports, and a decline in that of exports. Last week the average price of Wheat is placed at 29s. 7d. per imperial quarter; the price in the corresponding week last year was 39s. 4d., or nearly 10s. more. Doubtless an increase in the manufacture of preserved fruits has induced the producers to place a larger supply of sugar than usual on the market. With these preliminary remarks, we give the accompanying extracts from the summary for July of the imports of Colonial and Foreign products:—

IMPORTS.	1891.	1892.	Difference.
Total value for month	£32,824,111	£33,497,585	+673,474
§II.—(A.) Articles of food and drink—duty free	12,103,213	13,182,895	+1,079,682
(B.)—do., dutiable	2,183,195	2,433,056	+249,861
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	4,107,537	3,894,462	-213,075
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,967,914	4,283,371	+315,457
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	905,328	851,901	-53,427
(B.)—Parcel Post ...	45,938	49,726	+3,788

It may be as well here to note that the increase during the past seven months amounts to £1,038,907. The section relating to imports of fruits, &c., has this month its usual value for growers, salesmen, and consumers, as witness the following excerpts:—

IMPORTS.	1891.	1892.	Difference.
Fruits:—			
Apples, raw ... bush.	27,055	83,914	+56,859
Cherries	60,948	+60,948
Plums	70,721	+70,721
Pears	58,559	+58,559
Grapes	7,406	+7,406
Unenumerated, ..	495,787	205,873	-289,914
Onions	265,984	301,025	+35,042
Potatoes cwt.	900,319	769,406	-130,913
Vegetables, unenumerated, raw, ... value	£152,741	£149,116	-£3,625

Interesting as all of these figures undoubtedly are, they could be made much more valuable by the abolition of the words "unenumerated fruits" and "unenumerated vegetables." The reader may have noticed the recent arrival, per s.s. *Majestic*, from California, of 4000 cases of Pears, Pine-apples, Apricots, and Peaches. What the condition of the fruit on exposure was, we do not know of our own knowledge; but such a long passage, under often varying conditions as to temperature, must have been very trying for the fruit. A record of the temperatures experienced from orchard to refrigerator on board ship would be instructive.

THE EXPORTS

for the month again show a reduction amounting to £2,481,515, or over 11 per cent.; but as there was a working day less than in the corresponding period in 1891, the deficit may be reduced by some 3 per cent. This does not alter the fact that there is a falling off in the value of the exports (as well as in the quantity)—or the doing of more work for less money. The decrease in the seven months amounts to £14,686,765. There is some comfort in the fact that invention is being stimulated in this country, and in the production of textile manufactures some triumphs may soon have to be recorded. Of course, our

greatest drop is in the trade with America; but they are learning their lesson there. A high judicial authority has just reported that the recent terrible strikes are the result of the McKinley Tariff, which certainly does not appear to benefit the masses, whose good ought to be sought after by all sound statesmen. It is a great pity that experience has to be purchased at so high a figure as nations have to pay.

SUCCESSFUL PUPILS.—Among the successful candidates at the Science and Art examination held at York in May, we notice the names of Mr. A. SUTTON, Castle Howard Gardens, who passed in botany; in addition to Mr. KEMP, the Gardens, Kirkham Abbey, Messrs. JOHN BANNERMAN, JAMES KIRSS, JAMES MACKIE, J. T. HAYTON, and E. HAYTON, who have been equally successful in agriculture. All the pupils have been under the instruction of Mr. J. RIDDELL, head gardener to the Earl of CARLISLE, who, since he went to Castle Howard four years ago, has done everything in his power, by individual instruction in the sciences connected with horticulture, combined with a dissemination of practical knowledge in gardening, to assist the young men in acquiring a scientific knowledge of their profession.

THE WHITE LADY.—It is not often that the horticultural press has occasion to notice stage-plays, but there is, we learn, at the present moment an excellent *lever de rideau* at the Prince of Wales Theatre, which has a distinct interest to our fraternity. The scene is a cleverly-painted conservatory, and one of the chief actors is BLAKE, the gardener, who has succeeded in raising a new white Geranium, which he calls "The White Lady," in which he is confident there is a fortune. With the breaking up of the mansion to which BLAKE is attached as gardener, all the effects were to be sold, and, foreseeing the inevitable, he has saved up his odd sixpences and shillings until his collection has reached a sovereign. Not liking, as he expresses it, to have so much money about his person, he conceals the coin in the pot in which "The White Lady" flourishes, determining at all costs to purchase the apple of his eye, or rather the plant after his own heart. As is so generally the case with stage catastrophes, the "inevitable" is at the last moment warded off, and the sale does not take place. BLAKE, therefore, is twenty shillings to the good, and "The White Lady" is not put up for sale, and so we may assume that he lives happy ever after. The little "curtain-raiser" is decidedly clever, and a real living white Pelargonium is one of the silent actors in the piece; whether its name is really "The White Lady" or not, we cannot say, but the plant is a well-grown specimen.

CO-OPERATIVE PRODUCTION.—The labour association for promoting co-operative production, based on the co-partnership of the workers, will again organise an exhibition of co-operative productions at the Crystal Palace, in conjunction with the National Co-operative Festival. The exhibition will be opened on Saturday, August 20, and promises to be of a large and more representative character than any that have been held. Particulars of the exhibition will be forwarded on application to the Secretary, 9, John Street, Adelphi, London, W.C.

EMPLOYÉS PICNIC.—The employés of Messrs. LAIRD & SINCLAIR, nursery seedsmen, Dundee, held their annual picnic on the 10th inst. The place chosen was the Den of Airlie, and between fifty and sixty left Dundee in brakes. Mr. DAVID SMITH proposed a hearty vote of thanks to Messrs. LAIRD & SINCLAIR, who had contributed handsomely to the expenses of the excursion. Mr. J. W. LAIRD, in replying, said it afforded the firm much pleasure to assist in making the holiday a pleasant one.

GREEN PEAS.—Probably owing to the lack of favourable weather during the time the crops of early Peas were in bloom, and a failure on the part of many of the blossoms to set, causing a scarcity of crop, green Peas have fetched an unusually high price in some parts of the country, and especially in Lincolnshire, prices having advanced to far beyond their normal level. In consequence, many fields of

Peas intended for seed purposes have been picked over, consequently the usual harvest of seed Peas will be considerably curtailed. Much, therefore, depends upon the character of the weather during the next three weeks. Should it turn to wet the Pea harvest will be unfavourable, and some sorts scarce indeed.

A BOOK ABOUT THE GARDEN.—Dean HOLE, encouraged by the phenomenal success of his book about Roses has now issued through Mr. EDWARD AUNOLD, 37, Bedford Street, what is practically a reprint of various articles, published in the gardening journals, especially in the *Garden*, as well as in the *Guardian*. For instance, we have the "Six of Spades" now in a complete form, and other old friends, which lose none of their freshness on re-perusal. We may recommend those who have not read them before to avail themselves of the opportunity now, for they will find the Dean's pages sound in principle and amusing in form.

ODONTOGLOSSUM EXCELLENS ×.—When this Orchid was first introduced by Messrs. Low it was considered to be a natural hybrid between *O. Pescatorei* and *O. tripudians* or *O. triumphans*. This was, of course, a matter of inference only, but Messrs. VEITCH have demonstrated its correctness by raising *O. excellens* out of *O. Pescatorei* by pollen of *O. triumphans*. *O. Wilckeanum* × in like manner was proved to originate from the crossing of *O. crispum* and *O. luteo-purpureum*, as had previously been supposed. *O. excellens* var. *dellense* is figured in the July number of the *Lindenia*.

GARDEN DESIGNS AND ARCHITECTS' GARDENS.—Mr. W. ROBINSON has published, through Mr. MURRAY, an elegant booklet, in which he attacks with force and vigour the antique heresies that have been of late put forth in certain books, written by architects and reviewed in these columns. As we shall probably have occasion to allude at greater length to Mr. ROBINSON'S theories, we defer any further notice now, merely commending the beauty of the illustrations.

TURTLE SEEDS.—Under the name *Chelone-spermum*, Mr. HEMSLEY describes and figures in the *Annals of Botany* some highly-curious seeds of various Sapotaceous plants from the Solomon Islands and Fiji. The seeds, which measure about 1½ inch in their longest diameter, are in form and colour very like turtle shells, being convex on one side and flattish on the other, and in some cases marked with projecting wart-like processes.

HOOKE'S "ICONES PLANTARUM."—The last issued part (July) is entirely occupied with illustrations and descriptions of Indian Orchids. Most of them, are unimportant, horticulturally speaking, but some such as *Arundina Cantleyi*, t. 2112, *Eulophia holocheila*, t. 2116, and some others, will interest gardeners as well as botanists. We trust we may soon see them in the Kew collection.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY: FLORAL COMMITTEE.—Meeting of July 27, 1892.—The following certificates were awarded:—First-class Certificates. To Messrs. E. H. Krelage & Son, at Haarlem, for *Tigridia violacea* (imported new plant); to Messrs. De Graaff Bros., at Leiden, for *Tigridia violacea* (imported new plant); to Mr. Jac. Smits, at Naarden, for *Begonia tuberosa erecta* fl.-pl., with indented petals; to Mr. C. G. Van Tubergen, Junr., at Haarlem, for *Gla-diolus Saundersii* × *gandavensis*, *Andromeda* (new plant), *Dora*, *Lydia*, *Philomela*, *Vesta*; *Hymenocallis macrostaphana*, Baker. Second-class Certificates.—To Mr. W. Koelmeijer, at Wormer, for *Phlox* hybr. fol. var. (new plant); to Messrs. E. H. Krelage & Son, at Haarlem, for *Begonia tuberosa* fl.-pl.; to Mr. H. J. Lemkes, at Alfen aan den Rijn, for *Poa trivialis foliis albo-vittatis*; to Mr. C. G. Van Tubergen, Junr., at Haarlem, for *Calochortus venustus Vesta* (new plant), *Hymenocallis tubiflora* (insufficiently known plant). Votes of Thanks.—To Mr. H. J. Lemkes, at Alfen aan den Rijn, for *Dianthus caryophyllus* fl.-pl. Germania; to Mr. J. H.

Schober, at Putten, for a collection *Dianthus caryophyllus* fl.-pl.; to Mr. H. J. Van Heijst, at Wijk bij Duurstede, for *Ornithogalum revolutum*.

EXHIBITION AND CONFERENCE ON BEGONIAS, BRITISH FERNS, APRICOTS, AND PLUMS.—On Tuesday and Wednesday next, August 23 and 24, the historic gardens of the Royal Horticultural Society at Chiswick, will be enlivened by a great exhibition of Begonias, Apricots, and Plums, in addition to which growers of British Ferns will contribute specimens of our native Ferns, by way of showing what beautiful forms and varieties may be obtained by patient cultivation and careful hybridisation. All the committees will meet in the gardens at 11 A.M. precisely, on Tuesday, August 23, and

Plums will be presided over by Dr. ROBERT HOGG, F.L.S.; and Messrs. T. FRANCIS RIVERS and J. SMITH will read papers on "Desert Plums" and "Cooking and Market Plums," respectively; while Mons. F. JAMAIN of Paris will contribute a paper on "Apricots." Besides the exhibition of flowers and fruits which will be brought together on this occasion, it may be stated that the gardens themselves look extremely beautiful at present, and will well repay a visit not only from gardeners, but also from ladies and gentlemen interested in the promotion of horticulture. The Conference on Begonias, August 23, will be highly interesting, as showing what progress has been made during the last twenty-five years in the raising of new varieties. Curiously enough, however, the progenitors of the present types seem to have almost disappeared except from botanic gardens, and it would add great interest to the Exhibition if anyone who has specimens of them—*B. roseiflora*, *B. Veitchii*, *B. Pearcei*, *B. Davisii*, *B. boliviensis*, and *B. Clarkei*—would send them to the Exhibition, addressed to the Superintendent, Chiswick Gardens.

NEW SEASON HOPS.—The first pocket of this year's Worcester Hops passed the public scales on Friday, the 12th inst. They were grown by Mr. H. T. TAYLOR, of Showle Court, Ledbury, and purchased by Messrs. EDWARD WEBB & SONS, Hop and Seed Merchants, Wordsley, Stourbridge, who sold them to Mr. BENJAMIN ELWELL, of the Delph Brewery, Brierley Hill, at £10 per cwt.

THE AUGUST HORTICULTURAL MEETING AT GHENT.—A Certificate of Merit was awarded for an excellent lot of single tuberous Begonias from the Société Louis Van Houtte père, and another, to the same, for a collection of double tuberous Begonias. Certificates were also awarded for *Odontoglossum mulus odoratum*, to M. Jules Hye, very fine, with large brown spots upon it, and having a vanilla-like scent. Certificates of Merit for *Tropeolum Lindeni*, to M. Alf. Van Imschoot, with decorative foliage resembling that of certain coloured-leaved *Aristolochias*; *Cattleya gigas imperialis*, a distinct variety, but paler than the type; *Gongora atro-purpurea*, flowers in clusters, reddish-purple, a shy bloomer; *Cypripedium Curtisii* atro-purpureum, flowers large, and deeper in colour than usual; *Cattleya gigas Warscewiczii*, a fine example, with fifteen brightly-coloured flowers; and to *Cypripedium Rothschildianum*—all from the same exhibitor; also to *Phajus Humbloti*, from M. Aug. Van Geert; *Laelia elegans Vervaeti*, from MM. El. Vervaeet et Cie., a good specimen of an excellent variety; *Cypripedium elegans*, from M. Jules Hye, an excellent hybrid from *C. Harrisianum*. *Nephrolepis cordata compacta nana* from M. L. Desmid-Duvivier; a new Fern of great promise, fronds short, bright green, habit compact. *Lilium longiflorum floribundum*, from M. H. Schmitz; a free-blooming variety, each stem bearing from eight to ten white flowers. *Cypripedium lavigatum platytænium*, from M. J. Hye; with flowers remarkable for breadth of petal. *Odontoglossum tentaculatum*, from same exhibitor; a well-spotted and distinctive variety. *Sobralia xantholenca*, from M. Moens; flowers yellow—a shy bloomer. *Cliveia minata*, fol. var., from M. Jules de Cock, with fine panicle of bloom. Botanical Certificates were awarded for *Ceropegia Saundersii*, to Van Imschoot; a curious *Stapeliad* with greenish flowers. *Cypripedium Lavrenceanum bilabellum*, to M. L. Spaë-Vandermeulen, an interesting plant; the flowers borne on two stems and each with a double lip. Certificates for culture and blooming:—1st, *Dracena australis auro-lineata*, to M. Bernard Spaë; 2nd, *Adiantum Weigandi*, to MM. Duriez Frères. Honorable mention for *Odontoglossum Uro-Skinnerii* to M. Van Imschoot; *Acridas quinquevulnerum* to MM. Vervaeet et Cie.; *Adiantum grandiceps* to M. L. Desmid-Duvivier; *Miltonia virginalis*, to M. Aug. Van Geert, and *Pteris Victoriae* to the same exhibitor.

THE ROYAL SCOTTISH ARBORICULTURAL ASSOCIATION.—The members seem to have had what our American cousins call a good time on the

FIG. 37.—*CYPRIPEDIUM MORGANII* SHOWING 11-PLACEMENT OF PETAL, ETC. (SEE P. 215.)

there is no doubt but that two of them, viz., the Floral and Fruit, will have a busy time of it, while exhibitors of Orchids will receive the attention of the Orchid Committee at the same time. Every amateur grower of Begonias, Apricots, Plums, and British Ferns should endeavour to take part in this exhibition, and should at once, if it has not already been done, communicate the nature of their exhibit to the Garden Superintendent, so that due provision for space, &c., may be made in good time. In accordance with the practice inaugurated a few years ago, the Society will hold a Conference in the Great Vinery on each of the above-mentioned days at 2 P.M. The subject of the first day's Conference will be "Begonias." Mr. HARRY J. VEITCH, F.L.S., has consented to take the chair, and open the Conference, after which papers will be read by Messrs. W. WATSON, J. LAING, and H. CANNELL, on the "Cultivated Species of Begonia," "Tuberous Begonias," and "Winter-flowering Tuberous Begonias," respectively. On the second day (August 24) the Conference on Apricots and

occasion of their annual outing. Leaving Edinburgh on the 10th, the party first visited the veteran, Dr. Cleghorn, near St. Andrews, then passed on to Balbirnie, to which they had been invited by Colonel BALFOUR. Falkland Palace, the seat of the Marquis of BUTE, next attracted the attention of the foresters, then Nuthill, and finally the party came to rest for the night at Perth. Next morning a visit was paid to Tayside, Scone, and Murthley, where the Conifers attracted special attention. Perth was regained in the evening, where the annual dinner was held; Prof. BAYLEY BALFOUR in the chair. On the third day the party visited Methven Castle, Lyndoch woods, and the Cairnies, returning to Perth in time to catch the evening trains in various directions. We publish an instalment of a report of the proceedings in our present issue, and hope to insert further portions on another occasion. In the meantime, we are asked to give expression to the cordial feelings of gratitude experienced by the members for the courtesy and hospitality everywhere shown them.

IRIS LORTETI.—We have received the following from Prof. FOSTER.—I have received two letters which make me wish to add a few lines to the note on *Iris Lorteti* (see p. 152). Mr. VAN TUBERGEN writes, "You say you take the rhizomes out of the ground when the foliage is dying off. Do they really lose their leaves with you? With me, where the subsoil is continually moist, the plants remain fresh and green, and I am obliged to take them up when still quite full of life." Mr. EWBANK writes, "Mr. VAN TUBERGEN advised me to take the rhizomes up three or four weeks after flowering, while the leaves are still green, and put them in the greenhouse, the object being to move the plants before growth had begun. In following his advice, I found that growth had already begun, and some shoots of *I. Lorteti* were in a very uncomfortable state for moving at all. It seemed to be murder to take them up." These last words of Mr. EWBANK make it easy to understand why I am in general opposed to the "taking up method" of treating these *Irises*. It is undoubtedly a barbarous method, and should only be resorted to under compulsion; but it seems to me necessary for these special Palestine *Oncocyclus Irises*, until at least they have become acclimatised. To answer the above two questions, we must go back to first principles. Under their natural conditions, the leaves of these *Irises* die completely down soon after flowering, the "goodness" of the leaves descends into the rhizome, and this forms buds or shoots for next year's growth. Since, in the native country the drought which has withered the leaves, continues for a long time, the new-formed buds remain for a long time dormant; they do not start into active growth until the next season comes. They begin to be formed quite early, at flowering time, or even before; but the dry weather, which, after flowering, withers the leaves and ripens the seeds, so governs the changes in the plants, that the buds are not developed into leaves, but increase and fatten as mere buds. It is not until long afterwards, when the rain, "the early and the latter rain," comes, that the buds develop into tufts of leaves. In our climate the changes are different, and that in proportion to the moisture of the soil. On my dry hill, the growth of the plant does slacken, and the leaves do begin to die down, especially if aided with top lights; and when I take the rhizomes up, three or four weeks or so after flowering, the buds on the rhizome are white, fat, and dormant. But I can quite understand that at Haarlem, growth goes on more continuously, and the tokens which are useful to me are wanting to Mr. VAN TUBERGEN. Each of us must act according to his climate and conditions, checking and connecting our scientific deductions by careful experiences; and this, I take it, is the true art of gardening. Each of us has to strike a proper mean between two extremes. If the plants are taken up too soon, say immediately after flowering, there is too little opportunity for the foliage to enrich the rhizome; for the ripening, which goes on in a greenhouse, in a plant torn from its surroundings,

is but a sorry substitute for natural ripening in the ground. If, on the other hand, the plants are allowed, in a Mid or North-European climate, to remain too long in the ground, the newly-formed buds start prematurely into active growth, and the store of goodness gathered since flowering is wastefully expended. Each of us must be guided by experience to snatch the moment at which we may expect to do least harm, and gain most good. "There ain't no busses running from the Bank to Mandalay;" there are no rules in this bit of gardening which will suit all gardens and all seasons. I recommend for myself the taking up of these Palestine *Oncocyclus Irises*, because they with me make active growth in the late autumn to a much greater extent than do other *Oncocyclus Irises*; and when I do not take them up winter plays havoc with their well-grown foliage. The other *Oncocyclus Irises* with me, for the most part, make very little growth in autumn after the first spurt, which follows the late September rains, and I can much more safely leave them in the ground; for remaining in the ground is undoubtedly the most natural condition, and it is with great reluctance that I am driven to interference.

THE LATE DR. JAMESON.—The following letter has been sent us for publication:—

"British Legation, Quito, June 24, 1892.

"Sir,—You are probably familiar with the name of Dr. JAMESON, a botanist who was, I believe, in constant correspondence from this place with your predecessors at Kew, and who rendered great service to science. He died some years back, absolutely penniless, leaving two daughters, one of whom became a nun, and is thus provided for; the other, a most worthy and respectable lady, of past middle age, has supported herself, God knows how. On my arrival here, I found her in a penniless condition, and have made her a small allowance. She is, however, now suffering from some dreadful internal complaint, which is greatly exaggerated by the privations to which she has been exposed, and the want of proper food and medical comforts which she experiences. The calls on me are large, so I have ventured to think that [English botanists] might possibly be able and willing to help this poor lady, the daughter of a man to whom botany owes much, to pass her few remaining days—which must in any case be days of suffering—without at least the additional misery of want and privation. Should my application be successful, would you kindly place any sum that may be subscribed to my account at my bankers, Messrs. GOSLING & SHARPE, 19, Fleet Street, London, E.C., and advise me of having done so. I will undertake that she gets it, probably the best form would be in that of a weekly allowance. I venture to suggest this mode of payment, as apart from other reasons connected with the difficulty of postal and financial arrangements, the exchange here is much in favour of the resident (at this moment 50 per cent.), so that Miss JAMESON would be the gainer to that extent. (Signed) W. H. D. HAGGARD, H. B. M. Minister Resident. P.S.—There is only one other English resident here besides myself." Dr. JAMESON was for many years Professor of Natural History in the University of Quito, not a very lucrative post; and he was the author of various publications on the flora of the country.

THE LATE MR. EDWARD COOPER.—We have received the following note:—"The sudden death of Mr. COOPER (for seventeen years gardener to the Rt. Hon. JOSEPH CHAMBERLAIN, M.P.) created amongst a large circle of friends sincere grief for his loss, and of earnest sympathy with Mrs. COOPER, whose health has long been in a shattered state. Several of her late husband's personal friends feel a desire that this sympathy should take tangible form by the raising of a sum of money to be at Mrs. COOPER'S disposal in the hour of need. Mr. COOPER'S generous nature, coupled with the drain upon his income in various ways appertaining to Mrs. COOPER'S ill-health, left but little at his death for future wants, and as Mrs. COOPER has also her aged mother to support, it is thought that by forming a small

committee of friends, and raising a sum of money to be at her disposal, much will be done to materially lessen her grief, as well as show the practical sympathy of friends. Treasurer: Mr. H. J. CLIFFORD, King's Heath. Secretaries: Mr. H. A. BURBERRY, Ethel House, King's Heath; Mr. G. JOHNS, Moseley," Birmingham.

PETER LAWSON & SON, LIMITED, EDINBURGH.—At the annual general meeting of the shareholders of this Company, held on the 17th inst., the report as issued to the shareholders was adopted, and a dividend of 10 per cent. per ann. was declared; £1500 was added to the reserve fund, and the balance of £2974 12s. 9d. carried forward to next year. The retiring Directors, Mr. EASTES and Mr. PATEASON, were re-elected, and Mr. DAVID SYME, the present manager of the Company, was elected a member of the Board.

DISPLACEMENT AND SIMULATION.

As these are rather long words, shall we say, change of place and of form? After all, there is not much to choose between a multiplicity of syllables and an abundance of words. The reader shall take his choice; meanwhile, we put on record the appearances presented to us by a *Cypripedium* sent to us by Mr. Bull. As will be seen by the illustration, fig. 37, the two lower sepals (s) are present in their usual place, and of their customary form. One of the lateral petals, the lip, and the column are all normal. The peculiarity, then, rests in the upper segment of the flower. We say "segment," because that is a safe expression, and it would be rather a risk to assert either that it is a sepal or that it is a petal. In position, it is certainly a sepal; in appearance, it is partly a sepal, partly a petal. It is not prudent to make a positive assertion, because we are unable to see how it all came about. Could we have traced its erratic course from the beginning, there would have been no difficulty at all about the matter. On the whole, we incline to the belief that the upper segment is in reality a lateral petal displaced, and assuming, in a measure, the guise of a sepal. We may assume that, for some reason or other unknown, the upper sepal was not developed, and that the petal gradually took its place, and partly its appearance. The flower is that of *C. Morganæ*, a hybrid between *C. Stonei* and *C. superbiens*, and its hybrid origin may possibly have something to do with the perturbation of the floral organs.

The flower is shown in fig. 37 of the natural size. At the lower part is shown the column detached, with the two anthers, A A; at the upper part are two diagrams showing the relative position of the parts of the flower. The upper one shows the arrangement of the parts of the flower in their normal condition; in the lower one is a ground plan of the malformed flower. In each case, s represents a sepal, p a petal, c the column, l the lip, and o the ovary.

In the second illustration, taken from a flower of a *Cattleya* [*C. guttata*], sent us by Mr. Smees, we have a similar transposition, fig. 38. In it there are two lateral sepals, two petals, lip-like in their character, crossing them at right angles, and a straight erect column, with an anther at the top. This arrangement of the parts of the flower in two's instead of in three's is of a common occurrence in *Orchids*. The lip-like character of the petals is an instance of "peloria," or that change in which an habitually irregular flower is made regular by the increase in number of its irregular portions.

HOME CORRESPONDENCE.

ABIES GRANDIS.—I send you cones of *Abies grandis*. Here it is a fast-growing tree, well furnished with branches to the ground, but, like most of the Silver Firs, the cones are borne near the top of the tree; with us, there is not a cone nearer than 35 feet from the ground. *W. Osborne, Fota, co. Cork*. [A fine specimen of a noble tree. The cones were figured in these columns from a native specimen in 1885 n. p. 561, fig. 128; they are of a greenish colour. Ed.]

DEW, AND ITS ACTION ON PLANTS.—In looking through a work upon Physics that was published in the latter part of last year, I noticed that some experiments were described that had been carried out upon this very subject by a Mr. J. Aitken, and the conclusions which that gentleman arrived at were the following:—"That the greater part of true dew is formed from the vapour that rises from the heated ground and has been trapped by grass and other cold objects; and also the drops seen on grass and leaves are not dew at all, but moisture exuded from the living plant. These drops are only found at the extremities of leaf veins, i.e., at the points where the veins of the leaves cut the outer edges. The true dew is distributed all over the blade as a moist film." I may here state that the results obtained from these experiments are perfectly in accord with those of Professor Wollny. With regard to its beneficial action on plants, I should like to say a few words upon Mr. Henslow's experiments. If these experiments were carried out, as I presume they were, that the leaves were taken from their respective trees or plants, and placed for a certain period in direct sun, they then lose a portion of the water they contain, and are more or less flaccid; they are then weighed. After this process they are placed on the lawn for a period of twelve hours and then weighed again; and according to these experiments the leaves regained their normal conditions, and also show a gain. These experiments do not furnish sufficient evidence to justify Mr. Henslow in coming to the conclusion that these leaves gained their normal turgidity from moisture that has been absorbed through their epidermal surfaces; but, on the other hand, I contend that, as there was a heavy dew on at the time, it is very probable that the moisture was absorbed by the stalk of the leaf, and not through the cuticularised surfaces of many of the leaves, as it is a well-known fact that these surfaces are well-nigh impervious to water; and further, the amount of moisture that would be required to enable any of the leaves (in the list he supplies) to regain their normal condition, would be very small indeed. It is scarcely necessary to add, that when experiments of this kind are to be made, the utmost care is necessary, for if some of the minor details are overlooked or neglected, we cannot expect to arrive at true and correct results. *T. H.*

PEAS.—These have been good with us this season, perhaps, excepting the very early varieties, which came up rather thin. Our earliest crop was Chelsea Gem, following which was Cannell's English Wonder, a most valuable Pea, either for pot culture, early or mid-season work, it having pods of larger size than any other early Pea, and a wonderful cropper. Sutton's Bountiful is another very fine early Pea, bearing large well-filled pods of most delicious flavour. I have had two varieties of mid-season Peas from Messrs. Sutton of excellent qualities, very dwarf, and of great stamina, and profuse bearers of large pods. I find these Peas of dwarf stature most useful, as other crops growing between have greater advantage of sun and air, which is so essential to proper development; and I find all Peas do much better when several yards apart and other crops grown between. This season has also proved the advantages gained by growing in trenches, as with us it has been very dry, and consequently much water has been required. William I., Telephone, Duke of Albany, Duchesse, Triumph, Jubilee, Autocrat, Sir F. A. Milbank, Matchless Marrow, Sturdy, have all been satisfactory, and at the present time we have as good Peas as one could wish to see. I consider Sturdy and Ne Plus Ultra the two best late varieties, which may be had even in October if the weather is any ways kind. *W. A. Cook.*

THE HORSE-PLUM.—In reply to the inquiry of "Prunus" p. 193, there is a Plum called by that name, and I well remember my grandfather having several large trees that bore annually fine crops of fruits of the richest purple, and equally good for dessert or kitchen use. I cannot say if it is an American or English variety; I have at various times consulted works on horticulture, but could never find it described. I concluded the above name was only used locally. *W. J. Grace, Bickton, Fordingbridge.*

OBJECT LESSONS IN HORTICULTURE.—In reference to what was said by the *Agricultural Economist* with respect to the more practical employment of flower shows as object lessons, with oral explanation and instruction, I should like just to sketch a real picture of a scene at one of those flower shows

in Surrey. The district is essentially rural, and thinly populated. The scene a beautiful private garden. In the background a handsome house, and beside it a broad terrace. Grouped on this terrace are numerous visitors of the upper class, in the foreground a large body of the general public, seated and standing, among more remote beautiful lawns, trees shrubs, flowers, and the declining sun glinting through the tops of the trees, throws charming shadows. In the distance are the various tents containing the exhibits, their white coverings toned by frequent exposure, finding in the mass of woodland just beyond an admirable setting. Altogether it is a picture of loveliness, peacefulness, happiness, and contentment. The sound of a strong trained voice is now heard, and all eyes are turned to the terrace, where, behind the low balustrade, stands one of the horticultural experts of the County Council, sent first to judge the exhibits, then to talk to those interested in them as to their merits and demerits. On the top of the balustrade are selected examples, especially of vegetables, and after dilating upon the plant and flower exhibits sent by all classes, the expert refers to and utilises these selected exhibits as object lessons, showing what is good, what is otherwise, and thus imparting knowledge under the most advantageous conditions. The talk lasts for forty to forty-five minutes, and everybody is pleased and benefited. Sometimes the scene is a good

FIG. 38.—BIMEROUS FLOWER OF CATTLEIA. (SEE P. 218.)

private garden, where the public are invited to attend and hear an expert's opinions on the cropping and culture shown, as also to receive lessons in pruning or such other work as may be found desirable. That is better employment of such opportunities than in discussing market returns. *A. D.*

THE WHITE WATSONIA.—The paragraph respecting this lovely Cape plant, on p. 305 of the *Gardeners' Chronicle* for March 5, is obviously derived from a local correspondent, although its origin is not stated. I do not suppose that the present incumbent of the Port Elizabeth Park had any intention of misleading the readers of his note, but his want of information about the plant's origin, and the unlucky statement that "it was raised here," may lead to the inference that it is a seedling "raised" at Port Elizabeth. The plant was first found by Mr. Robert Templeman, formerly assistant at the Capetown Botanic Gardens, and within a day's journey from the city. It will not do to be too specific as to the exact locality, now that there are so many reckless amateurs scalping the mountains every holiday. The finder grew the corms among his stock for a season or two, and ultimately sent a few to the late Mr. John Wilson, then superintendent of the St. George's Park at Port Elizabeth. I cannot fix the date precisely, but this is something towards it. When Lord Brassey was round at Algoa Bay in the "Sunbeam," he saw and greatly admired Wilson's little clump of Watsonias, regretting that they were not for sale,

but destined as stock for reproduction. However, Wilson gave him Templeman's address in Cape Town, as the original finder, and when the "Sunbeam" came round to Table Bay, her owner bought a potful of the white Watsonia from Templeman for a sovereign. So you see it is a Cape-Western species, and not at all suited to be called the Port Elizabeth Pearl, the Pride of Algoa Bay, or St. George's Beauty. St. George will have to find a flower for himself, poor fellow, and keep better count of those which come to him by presentation from the Cape Peninsula. *P. MacOwan, Capetown.*

CAMPANULA PYRAMIDALIS AND PYRAMIDALIS COMPACTA.—The mention of this on p. 190 reminds me to ask what has become of a Campanula which was cultivated about fifteen years ago, and answered to the description given of this novelty? Seed was collected by Mr. Charles Lacaita near Tarento, in Southern Italy, and distributed under the synonyms of Campanula Rosani (Tenore), C. Tenorei (Muret), and C. versicolor (Gussone). I raised many plants, some of which lived two or three years, and flowered exactly in the form of a dwarf and compact C. pyramidalis. It proved too tender for my bad Cheshire climate, and I have lost sight of it, but I dare say it survives in some gardens. *C. W. Dod.*

SHORTIA GALACIFOLIA.—On p. 189 I observe a note, saying that this plant presents "few, if any difficulties to the cultivator." I can only say that, though I have had some experience in the cultivation of hardy plants, I have never been able to make this thrive. I know that plenty of gardeners will express great surprise, as they did when I announced my want of success with the common Christmas Rose, and with Gentianella. One will advise me to try a raised mound, another a depression in the soil, and so on; but all these plants will thrive anywhere, if atmospheric conditions are favourable; but if not, no treatment will overcome the difficulty. I find atmosphere a far more important factor in the welfare of hardy plants than either soil or aspect. *C. Wolley Dod, Edge Hall, Malpas.*

ANEMONE JAPONICA.—I send a crimped leaf from a plant of Anemone japonica. Five years ago three or four tufts appeared as a sport along one stolon from the ordinary form. I moved them, but only one lived, and produces all its leaves of this character year after year. It belongs to the pink-flowered form known in nurseries as "var. elegans," but has quite lost all stoloniferous habit, and I dare not try to divide it. The top-heaviness of the leaves, which makes them tumble about on the soil, would prevent its being ornamental, even if I could make a stock from it. The soil of the border in which it came is stony and poor, compared with most of my borders. *C. Wolley Dod.* [The leaves were extraordinarily lacinate, and crimped like Parsley or some forms of Scolopendrium. Ed.]

HYBRID CURRANTS.—I herewith beg to enclose a branch of black Currant crossed and produced by the red Currant, and (scentless) the fruit being a jet black tint and very shy bearer. I also send you a red Currant nearly black. This was crossed with the black Hamburg Grape, which has not improved its flavour. Again, a white Currant crossed with the Muscat of Alexandria Grape, which is equally unpleasant to the palate, but readily taken by the birds. I may just say that the flowering of these hybrids in the spring is very interesting in a botanical point. *P. Fry, Addington, Kent.* [The red Currants were certainly much darker than usual, but we could see no other trace of hybridisation. Our correspondent must excuse us if we maintain an open mind on the subject. Ed.]

ASSESSMENT ENQUIRY.—If your correspondent "G. D." is a *bona fide* florist or nurseryman, the greenhouse forms part of his stock-in-trade, and being personal property cannot be assessed at all (*vide* 3 & 4 Vict. c. 89, clause II., being repealed by a later Act). *James Young.*

FRUIT CROPS.—The fruit crop in Banffshire is only a moderate one, although Gooseberries are a heavy crop. Strawberries were only fair. Apples and Pears, with a few exceptions, are a complete failure, especially the latter. The early part of the season was very wet, and when fine weather was experienced, it was only to be accompanied by frosts at night. In some of the low-lying places, the trees present a very scorched appearance. *Robert G. Marshall, Banff.*

FRUIT CROPS.—Sorry I am late in sending report. Cherries good; Apples under; Pears good; Plums, Damsons, Peaches, and Apricots abundant. Small fruits all round are excellent; Nuts good. Vegetables are good, and Potatoes excellent and free from disease. *T. H. Rabone, Alton Towers, Staffordshire.*

— Taken as a whole this season, the fruit crops may be put down as an average crop. Currants, red, black, and white, are most plentiful, but have been interfered with by the caterpillar. Gooseberries also have been a good crop. Strawberries a good crop, and where plants were liberally watered fruit has been extra good. Raspberries have been an excellent crop, and fruit good. Apples are a medium crop upon standards; espaliers are heavy, especially early varieties. Pears are a medium crop, frost in the middle of June destroying good prospects. Jargonelle good, Beurré Giffard bad, Williams on west wall good, south wall bad; Louise Bonne average, Marie Louise average, Doyenné du Comice under average; Pitmaston Duchess, Catillac, and sundry other mid-season and late varieties, average. Plums, all varieties, a good crop; Damsons under average; Quinces a fair crop; Nuts a better crop than for four years; Medlars a shy crop; Apricots bad; Peaches and Nectarines average crop. Potatoes are grand, turning out very liberally, and if the disease can be kept at bay we shall have a very heavy crop. *W. A. Cook, Compton Bassett, Wilts.*

— In reference to the fruit crops in North Dorset, I might truthfully say I have never known them worse. We have a few Apples, and a sprinkling of Morello Cherries. Raspberries are almost a failure. Currants and Gooseberries fairly plentiful. Strawberries were very good, but a short season. Of these we only grow three varieties, viz., King of the Earlies, President, and Oxonian. Our mode of treatment is to make new plantations every two or three years. The Early variety I make a new plantation of every year. I find it gives us earlier and finer fruit. My practice for the last thirty years has been to lay the runners in small pieces of turf. Those who have not yet tried this plan will do well to do so. *W. G. Pragnell, Sherborne Castle Gardens.*

SCOTLAND.

LAW NOTES.

MESSRS. JAMES COCKER & SONS v. ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

An action, which has caused not a little sensation in horticultural circles in the North of Scotland, came before Sheriff Robertson, in the Aberdeen Sheriff's Court, on Monday, the 15th inst. Messrs. Cocker & Son, nurserymen and seedsmen, Aberdeen, sought to have the Acting Directors of the Royal Horticultural Society of Aberdeen compelled to receive certain exhibits belonging to pursuers which defenders had declined to enter for the forthcoming annual show of the Society. Mr. Cocker, senior, was formerly a director of the Society, but he withdrew consequent on the resolution to hold a grand military tournament in connection with the show. The defenders contended that as Messrs. Cocker's usual yearly donation was withheld when asked for, and was not paid before August 1, pursuers were no longer members of the Society. For the pursuers it was held that the condition as to payment of subscriptions before August 1 applied only to new members, and that in the case of members other than the Messrs. Cocker, subscriptions had been readily enough accepted after August 1. The Sheriff reserved his decision until Tuesday afternoon, when he issued the following interlocutor:—"Aberdeen, August 15, 1892.—The sheriff-substitute, having heard parties procurators, and considered the case, dismisses the action and decerns. Finds the defenders entitled to expenses, allows them to lodge an account thereof, and remits the same, when lodged, to the auditor of the court to tax and report. (Signed) Duncan Robertson. The sheriff, in a long note, remarked that whether defenders are acting wisely for the interests of their society, or altogether fairly in view of their past practice as to subscriptions, is another matter altogether, and one with which, it seemed to him,

he had nothing to do. The rule is explicit, and the fact that apparently in some instances in the past the officials have not strictly enforced it would not justify him in holding that they had thereby waived their right to enforce the rule, if, in their discretion, they think it fit to do so now. *W. Kelly, Aberdeen.*

ROYAL SCOTTISH ARBORICULTURAL ASSOCIATION. (From Our Special Correspondent.)

On Wednesday, August 10, the departure of the members of the Royal Scottish Arboricultural Association was made, under most favourable circumstances, for a three days' outing to the eastern and central woodlands of Fifeshire and South Perthshire. The "Foresters" were most kindly received, at Stravithie near St. Andrew's, by Dr. Cleghorn (an ex-President of the Association). The whole party, which was considerably augmented on the way, was entertained at breakfast by the veteran Doctor. Mr. J. Methven (Methven & Sons, Edinburgh), one of the Vice-Presidents, thanked Dr. Cleghorn for his hospitality, and applied to him the not improper designation of "Grand Old Forester," as to one who had done so much abroad and at home to promote the cause they had at heart, presenting the entertainer at the same time with a walking-stick, well crooked to pull down branches, and from which a saw opened to cut offenders off. Hearty cheers were given to Dr. Cleghorn, who then led the party to view the most picturesque portions of the grounds and gardens, where there are many Beeches, which thrive so well in the district; and on the top of the sloping grass declivities are represented choice collections of the more recently-introduced Coniferae. In a favourable position was planted by Mr. Milne (Dickson & Sons) a specimen of the Golden Cupressus Lawsoniana, commemorative of the visit. Some fine Cupressus, planted in 1866, which are about 30 feet high, and as much round the tips of lower branches were inspected. A large spreading Larch, loaded with cones, was close to this spot; Wellingtonia and fine Ashes; an Araucaria imbricata of 40 feet was in thriving condition.

Leaving Stravithie, after a lengthened railway journey *via* Thornton to Mar Kinch, the party arrived at the beautiful park of Balbirnie, to which they were invited by Colonel Balfour. The party was met by the veteran Colonel and Mr. Edward Balfour in the most cordial manner. The party passed by the front of the stately mansion, admiring as they went the beautifully-clothed flower garden, and inspected a Beech avenue, in which are some remarkable specimens of this tree, which has found such a congenial home at Balbirnie. The Den was reached, in which are yet some fine trees; but this charming retreat was severely thinned by the terrible winds which were experienced on the night in which the Tny bridge was blown down. Along the banks of the burn in this den, Boxes grow freely, and in many parts the ground is densely covered by Periwinkle. A return by a drive was made to a spacious tent, in which was served an excellent luncheon, partaken of by over ninety gentlemen. Mr. E. Balfour (younger), presided.

Two hours were then most profitably spent in the park inspecting trees and shrubs of great size and beauty. Many fine Beeches are to be seen on the high grounds, as well as singly in the park; also Oaks and Larches. A tall stem of an Ash, which had been grafted with a Weeping Ash, is an object of much interest from its pendulous branches having such space to droop before the ground can be reached. The planting of this park evidently has been done by those who have had a clear knowledge of landscape gardening. The whole surface being undulating—the valleys have been kept clear—and beautiful views may be had in all directions. The drives, four in number, all leading to points of direct communication with the main roads outside the park. They run with sweeping curves, north, south, east, and west, passing by interesting trees or shrubs which have never been crowded, and exhibit all the best characteristics of a well-appointed English park. Some fine purple Beeches are telling objects, and the general keep of roads and grounds reflect much credit on the head gardener (Mr. Henderson). Con-

siderable time was spent round the hills and della measuring and admiring trees, where some fine Conifers are growing of the newer species. A Beech 15 feet 10 inches in circumference was measured 5 feet above ground. Round the roots this tree measured 50 feet. A Larch, over 100 feet high, girthed 9 feet 4 inches. A Scots Fir, 90 feet high, girthed 9 feet. Some beautiful Albert Firs were passed. One, over 45 feet high, measured (5 feet from the ground) 3 feet 1½ inch in girth. A fine row of Araucarias was passed, and Abies grandis growing vigorously—a grand specimen of Rhododendron catawbiense was measured round its branches (which rise from one stem, afterwards parting into two), 50 feet, and is 20 feet in height. The policies throughout (though only a limited portion could be visited by the party), is managed with consummate care—nothing overdone and nothing neglected, the walks through shrubberies, under trees, and across green sward are said to be (by one who measured them) over 13 miles in length. There was not time left to visit the commercial timber on the estate, though views of it could be had from some of the heights, forming a beautiful landscape. A hurried run to the gardens was made, which are in admirable condition. Herbaceous plants are numerous, and in vigorous growth. Roses are a great feature, and in great numbers. The glass, which is represented by a range for forcing of fruits, along the northern wall, facing the south, and stretches from one end to the other; other structures are at the back for plants, all of which are well filled with healthy and useful species. The finest glass structures are at the south end of the garden, where small structures have been removed, and a fine length of span-roofed glass erected, in which are well-grown Palms, foliaged plants in general, and Orchids. Among other good things were a pair of Cattleya gigas, in flower; Dendrobium nobile, in fine form; Allamanda, Gloriosa superba, were among other creepers ornamenting the roof; but a few minutes only could be spent in these gardens, where Mr. Henderson's skill is everywhere favourably indicated in all departments. The whole party was photographed, and then a stampede had to be made to the conveyances *en route* for Falkland, after ringing cheers for the "House of Balfour." The party departed with sunny memories of a delightful visit to a most beautiful domain.

(To be continued.)

SOCIETIES.

WILTS HORTICULTURAL.

AUGUST 10.—The Wilts Horticultural Society held its annual exhibition in the charming and well-kept grounds of the Lord Bishop of the Diocese which surround the Episcopal Palace, Salisbury, on the above date. The weather was favourable, and there was a good number of visitors. The space at our command will only admit of the most notable exhibits being mentioned. They are as follows:—

Plants.—Twelve stove and greenhouse plants, distinct, consisting of six foliage and six in flower, were staged by Mr. James Cypher, Cheltenham; Mr. Wills, Winchester Road, Shirley, Southampton; and Mr. Curry, Wilton Road, Salisbury. The prizes (£15, £10, and £5) were awarded in the above order. Mr. Cypher's collection included large and well-coloured Crotons, finely-flowered Allamandas and Ericas, a grand specimen of Latania borbonica, some 14 feet in diameter; and a fine plant of Anthurium Scherzerianum, having about thirty large and finely formed spathes.

Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood House, Henstridge, was a good 1st in the class for nine stove and greenhouse plants (five foliage and four flowering), staging among others, fine examples of Allamandas nobilis and Hendersonii, Cycas revoluta, and Alocasia Thibautiana; Mr. Wills being 2nd, and Mr. Peel, gr. to Miss Todd, Sidford Lodge, Shirley, was 3rd. Mr. Wilkins was again to the front with six Exotic Ferns, showing fine specimens of Adiantum Farleyense, A. cuneatum, Cyathea medullaris, Davallia Mooreana, Thamnopteris nidus avis, and Microlepia hirta cristata; Mr. Peel was

2nd, and Mr. Evans, gr. to Lady Ashburton, Melchet Court, Romsey, 3rd, both showing well. Mr. Roby, gr. to Captain Greenwood, Harnham Cliff, Salisbury, was 1st in both classes for Begonias, defeating Messrs. Wilkins and Wills, who also staged good exhibits.

Groups of miscellaneous plants, arranged for effect in semi-circles, ranging from 12 to 8 feet in diameter, filled the centre of one large tent, and viewed either separately or collectively, made a fine show. Mr. Wilkins secured premier position in the two principal classes with light and very effectively-arranged groups, having a nice Palm, with arching fronds, occupying a central position in the background, and "dot" plants of *Tuberosea*, *Aralias*, *Cocos Weddeliana*, *Cattleyas*, *Oncidium*, *Celosia plumosa aurea*, *Dactylis glomerata variegata*, and *Bridal Wreath* (*Francoa ramosa*), the whole being set in a ground-work of Maidenhair Fern, and edged with *Isolepis gracilis*, and the prettily-marked *Caladium argyrites*. Mr. Carr, gr. to W. E. Gilbert, Esq., Oak Lodge, Bishopstoke, were 2nd and 3rd respectively in one class; and Messrs. Wills & Roby occupied like positions in the other, all with good arrangements. Mr. Bath, gr. to Colonel Pepper, Milford Hill, Salisbury, and Mr. Huxman, The Island, Salisbury, were each 1st in two other classes for good groups.

Fruit.—In view of the approaching fruit show at Earl's Court, one local gardener was, for the first time, during the last sixteen or seventeen years a non-competitor in the fruit classes at this show, nevertheless, there was a good all-round display of choice fruit. There were four good collections of eight kinds (Pine excluded), staged. Mr. Evans securing first position with Gros Maroc and Muscat of Alexandria Grapes, the latter good in bunch and berry, but not quite ripe, grand Brunswick Figs, Prince of Wales Peach, Elrige Nectarine, Moor Park Apricots, Melon, and Plums. Mr. M. McFarlane, gr. to William Baring, Esq., Norman Court, Salisbury, was 2nd, and Mr. Inglefield, gr. to Sir John Kelk, Bart., Tedworth House, Marlborough, was 3rd, both staging good exhibits. Mr. Inglefield had the best dish of Peaches, showing extra fine Walburton Admirable. Mr. W. Grace, gr. to W. R. Neave, Esq., Fordingbridge, had the best dish of Nectarines in Pine-apple; and Mr. Wilkins had the best flavoured Melon out of eight staged in Lockinge Hero. Mr. Budd had the best Apricots, showing large, clean, even fruits of Moor Park; and Mr. Smith, Palace Gardens, was 1st for Plums.

Grapes.—Mr. Davidson, gr. to Lord Wolverton, Iwerne House, Shaftesbury, obtained 1st prize for both Black Hamburg and Muscat of Alexandria, staging good-sized, well-coloured bunches of each; Mr. Charles Warden, Clarendon Park, Salisbury, securing 1st honours in the "any other" black and "any other" white Grape classes, with fine examples of Madresfield Court and Buckland Sweetwater, the bunches in each case being large and fine in berry and finish.

Apples.—These were well shown. Mr. Wilkins secured 1st position for three dishes of dessert varieties, Beauty of Bath, White Astrachan, and Red Astrachan; Mr. Smith being 1st for a like number of culinary varieties, staging large, clean, even fruits of the Queen, Lord Suffield, and Ecklinville Seedling; Dr. W. D. Wilkes, the Canal, Salisbury, securing premier award for a like number of dishes in another class with remarkably fine fruits of Catshead Codlin, Lord Suffield, and Dutch Codlin.

Vegetables.—Three collections of twelve kinds of vegetables were staged by Messrs. Inglefield, Wilkins, and R. West, Northlands, Salisbury, and the awards were made to the exhibitors in the above order. The Onions, Autumn Giant Cauliflowers, Sutton's Perfection Tomatos, Satisfaction Potatos, Duke of Albany and Prodigy Peas, and Runner Beans being exceptionally good.

The cut flower classes were well represented, Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester; Dr. D. S. Eaton, Bitterne; and Mr. Browning, gr. to the Rev. Canon Sir Talbot Baker, Bart., Blandford, being the most successful in the Rose and Dahlia classes; Mr. Budd being successful with eighteen bunches of hothouse flowers, distinct; and Mr. J. R. Chard, Stoke Newington, London, had the best bridal and ball-room bouquets, composed of choice flowers.

Non-competing exhibits from Messrs. Keynes, Williams & Co. covered large lengths of staging, consisting of floral gems in the way of Roses, Gladioli, Carnations, and novel table decorations in the form of arches, admirably dressed with common garden flowers and grasses, high double arches clothed with green moss, and then thickly studded with Roses

perfect in form and colour; new Cactus Dahlias, including Marchioness of Bath, soft crimson-lake, delicate pink towards edge of petals; Lady Skelmersdale, chrome yellow—a striking variety; Countess of Radnor, a beautifully-shaded rose-cerise; and Countess of Gosford, amber shaded soft vermilion—one of the most striking varieties yet raised.

Messrs. Robert Veitch & Son, of Exeter, also contributed large and varied assortments of cut flowers, including a grand lot of new Carnations and alpine plants in pots, which together made a very attractive and interesting display.

Mr. Davis, Yeovil, exhibited grand stands of the double and single flowered varieties of the Begonia. Mr. Pritchard, Riverslea Nursery, Christchurch, and B. Ladkams, Shirley Nursery, Southampton, also contributed numerous kinds and varieties of herbaceous flowers, which went to show what a fine and varied floral display can be obtained from hardy flowers—flowers which come within the reach of rich and poor alike.

SUTTON BRIDGE HORTICULTURAL.

August 10.—The annual exhibition was held on this date, in the picturesque grounds of Mr. M. R. Thorold, President of the Society. Favoured with lovely weather, the show this year was held under most favourable circumstances. The general merit of the exhibits was extremely high, and the competition so keen that the judges had much difficulty in awarding the prizes in many of the classes.

The Ferns shown by Mr. Jas. Ruther and the Rev. W. H. James, Fleet Rectory, created much interest; and the collections of ornamental plants shown by the same exhibitor, were of great merit.

Fruit and vegetables were well represented, and the show of Potatos was as good as could be got together anywhere. Special prizes were offered by Messrs. Webb & Son, Stourbridge; Daniells Bros., Norwich; Chas. Sharpe & Co., Sleaford; Messrs. Sutton & Sons, Reading; Jas. Carter & Co., High Holborn; by Mr. J. R. Clarke, and Mr. C. Goss.

TAUNTON DEANE HORTICULTURAL.

August 11.—The twenty-fifth exhibition of this Society proved one of the best ever held, and the weather being very fine, and the attendance enormous, the financial results were very gratifying. The tents, five in number, two of them of great size, were pitched in Vivary Park, which is immediately contiguous to the town, and therefore easy of access. It is undoubtedly one of the finest exhibitions held in the West of England, and attracts exhibitors from many parts. As the competition is always good, it is matter for regret that 3rd prizes are offered in so few classes. The Society having greatly improved its financial position since 1890, the committee may perhaps see their way next year to restore the 3rd prizes to the schedule.

Stove and greenhouse plants are always a fine feature, and in the open class Mr. James Cypher, Cheltenham, held the premier position once more with twelve specimens in flower. He had *Allamandas nobilis* and *Hendersoni*, *Ericas* Thompsoni, *Austriana*, *McNabiana*, and *Aitoniana*, *Franciscea calycina major*, a fine piece; *Anthurium Scherzerianum*, *Bougainvillea glabra*, *Clerodendron Balfourianum*, *Ixora Pilgrimi*, and *Phenocoma prolifera* Barnesi. 2nd, Mr. J. F. Mould, nurseryman, Pewsey, with excellent specimens, though a few of them were getting a little stale; he had *Stactis* Gilberti, very fine—a striking dark variety, said to have been raised on the south coast; *Tremandra verticillata*, large, well grown and bloomed; *Allamandas Hendersoni*, *Wardleiana*, and *nobilis*; a fine piece of *Erica tricolor* Wilsoni, &c. 3rd, Mr. W. Rowland, gr. to Mr. Brock, Exeter, with capital fresh plants.

Mr. Cypher was also 1st with six, having another fine *Phenocoma*, *Allamanda nobilis*, *Erica Austriana* and *oblata purpurea*, *Stactis profusa*, and *Ixora Williamsii*—a very good collection; Mr. Rowland was 2nd, and Mr. Mould 3rd.

In the amateurs' division for twelve plants, not necessarily in flower, Mr. Rowland was 1st, with very good examples of *Ixora Dixiana*, *Dipladenia amabilis*, *Croton Andreanus*, *Cycas revoluta*, *Lantana borbonica*, &c.

With six plants, Mr. S. Ridley, gr. to W. E. Hall, Esq., Yeovil, was 1st, with a seedling *Bougainvillea* of the type of *glabra*, but smaller in the flowers and much deeper in colour, extremely free flowering;

Kalosanthes coccinea, *Clerodendron Balfourianum*, &c. 2nd, Mr. Rowland.

Mr. J. Currey, Salisbury, had the best four plants; and M. W. Peel, gr. to Miss Todd, Shirley, 2nd.

Tuberous Begonias were a very fine feature indeed, and the progress made with these as exhibition plants at Taunton during the last few years is something remarkable. The best eight in the open class came from W. Herbert Fowler, Esq., Claremont, Taunton, who is a great lover and a most successful cultivator of these plants; Mr. H. Godding, nurseryman, Taunton, was 2nd. There were several competitors, and all the plants were good. In the amateurs' class for six singles, there was a good competition also. Mr. Cavill, gr. to H. T. Manley, Esq., Bishops Hall, was 1st; and Mr. S. Tottle, Taunton, 2nd. With six doubles, Mr. G. Chapman, gr. to C. H. Samson, Esq., Taunton, was 1st. Zonal Pelargoniums, both single and double, were very good, the 1st prizes in each class being taken by Mr. C. Way, gr. to G. E. Colthurst, Esq., Taunton; Mr. C. Totterdell, gr. to A. J. Spiller, Esq., Taunton, was 2nd also in both classes. *Fuchsias* were fairly good, and *Cockscombs* decidedly so.

Orchids were represented only by four good specimens from Mr. J. Cypher. The best newly-introduced foliage plant was *Croton Madame D'Alaene*, distinct in habit and brilliant in colour, from Mr. Cypher. The best newly-introduced flowering plant was *Dendrobium Phalaenopsis Schroderii*, a fine form of it, from Mr. J. Cypher; and Mr. Rowland was 2nd with a delicately-tinted seedling *Dipladenia*, named Miss Sophie Brocke.

In the amateurs' division, Japan Lilies consisting of finely grown examples of *L. speciosum* and *L. auratum* were shown; also good zonal Pelargoniums, *Gloxinias*, *Achimenes*, *Petunias*, *Balsams*, &c.

Foliage plants were a commanding feature. In the open division, Mr. Cypher was 1st; Mr. J. Currey was 2nd; and Mr. Mould, 3rd. In the amateurs' division, Mr. Rowland was 1st; Mr. J. Currey taking the 2nd prize. Mr. Rowland also had the best eight exotic Ferns; 2nd, Mr. J. Lloyd, gr. to V. Stuckey, Esq., Langport.

Hardy Ferns and exotic mosses were admirably shown by Mr. R. Huxtable, gr. to F. W. Newton, Esq., Taunton.

Groups arranged for effect make a good feature also, but the narrowness of the tents necessitates a kind of kidney shape, which prevents the plants from being seen to the best advantage. In the open class, Mr. Rowland was 1st, and Mr. Currey 2nd, both with very good arrangements. In the amateurs' class, Mr. Peel was 1st, and Mr. Rowland 2nd.

Cut flowers were represented by Roses, Messrs. Perkins & Sons, Coventry, taking the 1st prizes in the open classes, with thirty-six and twenty-four varieties; Dr. Budd, of Bath, being 2nd in both cases.

In the amateurs' classes, Dr. Budd won in both classes for hybrid perennials. With twelve Teas, Mr. W. H. Fowler took the 1st prize with some very fine flowers.

Dahlias fell behind their usual quality at this show, owing to the late season. Gladioli were superb. Mr. W. H. Fowler took all the 1st prizes with very fine spikes. Asters were scarcely up to the mark.

The 1st prize for a stand of twelve varieties of stove and greenhouse cut flowers went to Mr. W. Iggulden, gr. to the Earl of Cork, Marston, Frome. Bunches of hardy herbaceous perennials, &c., were finely shown by Mr. A. A. Walters, Bath, and Mr. G. Garraway.

A remarkably fine lot of fruit was staged, Mr. Iggulden was placed 1st with ten dishes, having Muscat of Alexandria and Madresfield Court Grapes, Sea Eagle Peaches, Stanwick Elrige Nectarine, Hemskerk Apricots, Oullin's Greengage Plum, brown Turkey Figs, Pine, Cherries, &c.; 2nd, Mr. J. Lloyd, with a remarkably good collection; and Mr. J. Bruton, Yeovil, was 3rd. Mr. Iggulden was also 1st with four dishes, having black Hamburg Grapes, Sea Eagle Peaches, Downton Nectarine, and Melon; 2nd, Mr. J. Lloyd. Mr. F. Crossman, gr. to Earl Poulett, Hurton, St. George, was 1st with black Hamburg Grapes, very fine in berry and bunch; Mr. Iggulden was 2nd. In the class for any other blacks, Mr. C. Warden, gr. to W. C. Watson, Esq., Salisbury, was 1st with excellent Madresfield Court, and Mr. Iggulden 2nd with the same. Mr. W. Connolly, gr. to J. R. C. Talbot, Esq., Lyme Regis, was 1st with very fine white Muscats, and Mr. Iggulden 2nd. Mr. C. Warden had the best three bunches of any other white, having excellent Buckland Sweetwater; Mr. G. F. Luttrell, Dunster Castle,

was 2nd. Melons were numerous, Hero of Lockinge being the best. The best Peaches were Dymond and Bellegarde. Nectarines, Pine-apple and Elruge. Apricots, Moor Park; Pears, Jargonelle, very fine; light Plums, Green Gage, dark, Prince of Wales (?), and Duke of Wellington; dessert Apples, Beauty of Bath, and Astrachan; cooking Apples, the Queen, and Lord Suffield. Bush fruits were very good.

Vegetables were numerous and wonderfully fine throughout. Mr. G. Garraway, Bath, had the best collection of ten dishes; Mr. W. Perryman, gr. to W. Ricks, Esq., Bridgwater, was 2nd. Messrs. Sutton & Sons' special prizes for six dishes were taken by Messrs. J. Brutton and W. E. Hall; Messrs. Carter & Co.'s by Major Birton and Mr. W. Perryman; Messrs. Webb & Sons' by Messrs. G. Garraway and H. F. Manley. Major Birton had the best six dishes of Potatos, staging remarkably fine examples of Prizetaker, Windsor Castle, Reading Russet, Reading Giant, The Dean, and Cosmopolitan; Mr. W. M. Bryant was 2nd with a very fine collection also. All other vegetables were very good. The cottagers' tent made a show in itself, and everything was admirable.

Table Decorations filled a tent, and Mr. J. R. Chard, Stoke Newington, took the 1st prize with a remarkably elegant arrangement of the arcadian design. In the classes for vases, bouquets, baskets, sprays, &c., Messrs. Perkins & Sons, Chard, and Messrs. M. Jones, Taunton, were the principal prize winners.

Miscellaneous collections included a remarkably fine collection of double and single Begonias (cut) from Mr. B. R. Davis, nurseryman, Yeovil; a collection of very fine spikes of Gladioli and hardy flowers from Messrs. Kelway and Son, Langport; a collection of plants, cut flowers, &c., making an extremely valuable feature, from Messrs. R. J. Veitch & Son, Exeter; and hardy cut flowers, &c., from Messrs. Jarman & Co., seedsmen, Chard.

Certificates of Merit were awarded to Messrs. Kelway & Son, for Gladiolus Orme, Sir A. A. Elton, and Sir Hugo; and to W. H. Fowler, Esq., for Madame Auher, a charming light variety.

THE PAST WEEK.

The following summary record of the weather for the week ending August 13, is furnished from the Meteorological Office:—

"The weather during the earlier part of the period was generally cloudy, cold, and dull, with heavy falls of rain—especially in the west and north; as the week progressed, however, it became fine and dry over England, although it still continued unsettled, with frequent rain, in most parts of Ireland and Scotland. By the end of the period disturbed conditions again extended to the English districts, and rain occurred very generally, accompanied in many places by thunder and lightning.

"The temperature just equalled the mean in the Channel Islands, but in all other districts it was low. The highest of the maxima were recorded as a rule, on the 12th, but occurred at some few stations on the 8th. They ranged from 78° in 'England, E.' and the 'Midland Counties,' to 69° in 'Ireland, N.,' 68° in 'Scotland, N.,' and 66° in 'Scotland, W.' The absolute minima, which were registered on the 11th, were exceedingly low for the time of year. In 'Scotland, E.' the thermometer fell to 33°; in 'Scotland, W.' and 'England, N.W.' to 34°; and in 'England, N.E.' and the 'Midland Counties' to 35°; in most other districts it fell to between 37° and 39°, but in the Channel Islands it did not descend below 49°. In many of the more inland stations frost was experienced on the Grass.

"The rainfall exceeded the mean in Ireland, Scotland, and the northern parts of England, but again showed a deficit in all the southern, central, and eastern parts of England, as well as in the Channel Islands. Over the south of Ireland, the west of Scotland, and the north of England the excess was very considerable.

"The bright sunshine was less than the mean in all districts, except the 'Channel Islands.' The percentage of the possible duration ranged from 23 in 'England, N.E.' and 'Ireland, S.,' to 40 in 'England, S.,' and to 59 in the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, August 18.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal tradesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

BUSINESS steady, with prices firm. James Webber, Wholesale Apple Market.

POTATOS. MARKETS very dull, with lower prices for all samples. J. B. Thomas.

FRUITS AND VEGETABLES.

SPITALFIELDS: Aug. 16.—Quotations:—English Apples, 2s. 6d. to 5s. per bushel; Pears, 2s. to 3s.; Gooseberries, 3s. to 3s. 6d.; black Currants, 4s. 6d. to 5s. 6d.; Victoria Plums, 4s. to 5s.; Orleans do., 6s. to 7s. per half-sieve; foreign Tomatos, 8d. to 10d. per box; Raspberries, 1s. 6d. to 1s. per punnet; Green Gages, 4s. to 6s. per flat; Seakale, 9d. to 1s. per punnet; Cabbages, 2s. to 3s. per tally; Spinach, 1s. to 1s. 6d.; French Beans, 1s. 6d. to 2s.; Scarlet do., 1s. 6d. to 4s.; Broad do., 1s. to 1s. 3d.; Peas, 1s. 9d. to 2s. per bushel; Cauliflowers, 1s. 6d. to 2s.; Cabbage Lettuce, 2d. to 3d.; Leeks, 2s. to 2s. 6d.; frame Cucumbers, 1s. 6d. to 2s.; natural do., 4d. to 8d. per dozen; Turnips, 1s. 6d. to 2s.; Carrots, 1s. 6d. to 3s.; Spring Onions, 7s. to 4s.; Parsley, 1s. to 2s. per dozen bunches; Cos Lettuce, 3d. to 6d. per score; Mustard and Cress, 1s. 6d. to 1s. 9d. per dozen baskets; Dutch Onions, 3s. 9d. to 4s. 3d. per bag of 110 lb.; Spanish do., 5s. to 5s. 6d. per case; Horseradish, 1s. to 1s. 1d. per bundle.

BOROUGH: Aug. 16.—Quotations:—Cabbages, 3s. to 4s. Marrows, 3s. to 4s. per tally; Scarlet Beans, 1s. 6d.; Peas, 2s. per bushel, and 3s. 6d. to 5s. per bag; Carrots, 3s. 6d. to 4s.; Turnips, 3s. to 4s.; Parsley, 2s.; English Onions, 2s. 6d. per dozen bunches; Egyptian do., 5s. 6d. to 6s. per cwt.; English Apples, 2s. 6d. per bushel.

STRATFORD: Aug. 16.—There has been a good supply of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 2s. to 5s. per tally; Cauliflowers, 1s. to 2s. per dozen; Mangels, 30s. to 32s. per ton; Onions, English, 60s. to 70s.; Dutch, 3s. 3d. to 3s. 9d. per bag; Oporto, 5s. 6d. to 6s. 6d. per case; Onions, 1s. 6d. to 2s. 6d. per dozen bunches; Apples, English, 4s. to 6s. per bushel; Bordeaux, 3s. to 6s. per case; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, 2s. to 2s. 6d. do.; Cucumbers, frame, 1s. 6d. to 3s. per dozen; Dutch do., 1s. to 1s. 6d. per dozen. French Beans, 1s. to 2s. per sieve; scarlet do., 1s. 6d. to 2s. 6d. per sieve; do., 2s. 6d. to 4s. 6d. per bag; broad do., 2s. to 3s. per bag. Peas, 2s. 9d. to 4s. 6d. per bag. Plums, 3s. 6d. to 5s. per half sieve.

FARRINGTON: Aug. 18.—Quotations:—Turnips, 2s. per dozen bunches; English Onions, 4s. to 5s. per cwt.; Plums, Orleans, 7s. per half bushel; do., white Gisbourns, 3s. do.; Orleans, 7s. do.; Apples, cooking, 4s. per bushel; Pears, Duchess, 3s. per box of 70; Tomatos, foreign, 2s. 6d. per box of 18 lb.

NOTICES TO CORRESPONDENTS.

PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

BERCH: Henwick. We should suspect that drought at the roots is the cause of the mischief. Perhaps there is an old-forgotten drain beneath the surface.

BOTANICAL GARDEN: H. C. Swanley. Write to the Secretary of the Royal Botanical Society, Regent's Park.

CARNATIONS: J. P. Evidently a good strain, worth growing on.

ERICA WILMOREI X: Correspondent. This was raised in the garden of John Wilmore, Esq., by his gardener Mr. John Williams, and is figured in Knowles' and Westcott's Floral Cabinet, ii., 1838, t. 73. As a hybrid it should have the X attached, or if you prefer it, the word hybrid. Strictly the name, as it is only a complimentary designation, should have been Wilmoreana X. It would have been better still to have called it E. Williamsi X, as Williams was the actual raiser.

GLOXINIAS: S. G. Your specimens have been carefully examined, but no trace of fungus has been found. We conclude, therefore, as has happened in other establishments, there has been some faulty management, probably over-watering, so that water has lodged in the crown and rotted the leaves.

GRAPES: Packerr. All the packing in the world is useless, unless you can guarantee proper treatment on the journey, which is rarely accorded to light packages on board ship. Your usual packing

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.	BRIGHT SUN.
	ACCUMULATED.					
Above (+) or below (-) the Mean for the week ending August 13.	Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since Jan. 3, 1892.	Below 42° difference from Mean since Jan. 3, 1892.	More (+) or less (-) than Mean for the Week.	No. of Rainy Days since Jan. 3, 1892.
Day-deg.	Day-deg.	Day-deg.	Day-deg.	10ths Inch.	Ins.	
0	1	81	0	-18 + 212	3 + 148	25.8 24 29

10	1	116	0	-25 + 132	9 + 110	20.3 23 35
11	0	141	0	+ 37 + 42	2 - 101	13.5 59 50

The districts indicated by number in the first column are the following:—
0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

is the safest that can be adopted, and if you could get it placed under someone's special charge, all might be well. Madresfield Court is not one of the best varieties to travel, the skin being liable to crack.

HOPS IN TENERIFFE.—Procure some "sets" in spring, pack them in moss, not too damp, or in soil. No Phylloxera attacks Hops, so far as we know. It is quite likely, nevertheless, that the Customs would object to the introduction of Hops for the reason you mention. We have heard of Potatoes and bouquets being stopped. As to the pamphlet you mention, apply to the Royal Agricultural Society for a copy of their prize essay.

LAPAGERIA: J. C. A mottled flower, of no particular merit.

MUSHROOMS: G. H. The field Mushroom; useful for catsup, and not unwholesome.—S. M. *British Edible Fungi*, by M. C. Cooke, published by Kegan Paul & Co., Charing Cross Road.

NAMES OF FRUITS: C. W. H. Peach Noblesse.

NAMES OF PLANTS: H. K. 1, Stanhopea insignis; 2, Oncidium longipes.—F. S. M. Hedychium Gardnerianum.—L. R. Conoclinium ianthinum.—Turnford. Campanula carpatia, white-flowered form.—W. B. 1, Aconitum variegatum; 2, Spiraea Douglasi; 3, Campanula Medium, double-flowered; 4, Tradescantia virginica; 5, next week.—Lost. We do not undertake to name varieties; send them to some nurseryman who grows them largely.—R. L. M. 1, Phytolacca decandra; 2, Reineckia carnea variegata; 3, Panicum plicatum.—J. N. D. The plant that has grown up among your Onions, is Asphodelus fistulosus, a native of France, Portugal, and Southern Europe. It was, no doubt, introduced with foreign seed.—Correspondent, Cadburybox. 1, Lychnis diurna alba; 2, Achillea aurea; 3, Malva moschata alba; 4, Achillea ptarmica; 5, Potentilla sp.; 6, Solidago canadensis; 7, Betonica carnea; 8, Serratula tinctoria.—H. A. M. H. 1, Pteris tremula; 2, Asplenium flaccidum; 3, Aspidium falcatum; 4, Nephrolepis tuberosa; 5, Blechnum polypodioides; 6, Lastrea glabella.—C. L. 1, Passiflora laurifolia; 2, Hæmanthus natalensis.—J. F. F. H. 1 and 2 next week; 3, Spiraea arifolia.—J. W., Sheffield. A new species of Stapelia, of which we hope shortly to publish a description.

PTERIDOLOGICAL SOCIETY: Chas. T. Drury. Will appear shortly.

RUST ON LETTUCES: J. P. In the absence of any specimen, we expect your Lettuces are affected with the Lettuce mildew (Peronospora ganglioniformis). This is a fungus, and generally is most observed on plants grown in frames, &c., or on plants that have been transplanted. The thinner the seed is sown the less chance will the fungus have. Pull up all affected plants, and remove all decayed leaves, &c. Keep the plants clean, and do not sow on same piece of ground another year.

VARIETIES OF VEGETABLES: Doubtful. This is the old difficulty arising from the schedule—framers not defining the sense in which they intend their words to be taken—Cabbage and Cauliflower belong to one genus (plural genera); Peas to another, and so forth. Hence in the list you send—A. has eleven varieties belonging to six genera; B. has eight varieties belonging to seven genera. A Cucumber is in reality a fruit used as a salad; Beet is certainly used as a vegetable.

VINE DISEASE: Subscriber, and others. It is the same disease that has been rather inaptly called Diphtherites. Similar specimens have now been examined at various times by different observers, but neither fungus nor insect has yet been met with. The appearance are consistent with defective root-action, but how induced there is no evidence to show.

WEEVILS ON GRAPES: J. T. L. The beetles seem to have perforated the berries, which have consequently rotted. Trap the insects with slices of Carrot or Potato, and visit the vineries at night.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—F. SANDER AND CO., St. Albans.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

£5 will be given for information leading to Advertiser's appointment as HEAD GARDENER where eight or more men are kept. Age 40; twenty-five years' practical experience. Highest references from present and previous employers.—H., Gardeners' Chronicle Office, 41, Wellington Street, Strand, London, W.C.

GARDENER (HEAD); age 29.—Mr. WATTAM, Head Gardener, Shenlith, Hemel Hempstead, Herts, can highly recommend his late Foreman as above; fifteen years' experience.

GARDENER (HEAD).—Married, no family; age 34; has a thorough practical knowledge in Cultivation of all varieties of Plants, Fruit, and Vegetables, together with the requirements and Managemen of a well-kept establishment. Five years' good character as Head Gardener, and is strongly recommended by Mr. J. Willard, Head Gardener, Holly Lodge, Hightgate, N., where he was previously employed, and who will answer any inquiries.—Please address F. W. RUSSELL, Wood Green, Chess-hunt, Herts.

GARDENER (HEAD).—Age 29, married. A Nobleman wishes to recommend his Head Gardener to anyone requiring a thoroughly competent and reliable man at his work. Establishment changes the reason for leaving.—G. L., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD).—Age 30; well-up in Plant, Fruit, and Vegetable Growing. Fifteen years' experience. First-class testimonials.—C. D., Mrs. Cheer, Stroud Green Road, Shirley, Croydon, Surrey.

GARDENER (HEAD).—LADY HUIT, Appley Towers, Ryde, would be pleased to recommend her Head Gardener, T. D. Myles, to any nobleman or gentleman requiring the services of a good gardener; has been here ten years, and has had large experience in all matters connected with gardening, and good testimonials from previous employers. Leaving through alteration in the establishment.

GARDENER (HEAD).—Middle-aged, no family; thoroughly practical in all branches, including House Decoration, Land, and Stock. Excellent recommendation.—P. O., 1, Linda Cottage, Railway Side, White Hart Lane, Barnes.

GARDENER (HEAD), where two or three are kept; age 26, married; eleven years' experience.—J. CLEAR, Gardener to Lord Sudeley, Toddington, Wincoboe, R.S.O., Glos., would be pleased to recommend a man as above.

GARDENER (HEAD).—Thoroughly practical in all branches of high-class Gardening. Excellent character, and references given.—NETLEY, Mr. Amys, Steward, Hamble Cliff, Netley, near Southampton.

GARDENER (HEAD).—Age 41.—A GENTLEMAN will be pleased to recommend a good Fruit and Plant Grower, including Orchids; also Flower and Kitchen Gardening. Capable of Managing a large place. Highest references from previous employers. Abstainer.—GARDENER, The Knoll, Shipley.

£10 BONUS will be paid by Advertiser (age 29) for information that will lead to his obtaining a situation as HEAD GARDENER. Thoroughly experienced in all branches.—C., 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING), where three or four are kept.—Geo. HOWES, Head Gardener, Merton Hall, Thetford, would be pleased to recommend Westley Gee, who has been with him one year and four months as Second Gardener. For testimonials and further particulars, apply as above.

GARDENER (HEAD WORKING).—Age 48, married; thoroughly understands the profession in all its branches; eleven years in present place, nine previously, with the Rt. Hon. G. Ward Hunt, M.P. Satisfactory reasons for leaving.—GARDENER, Marks Hall, Kelvedon, Essex.

GARDENER (HEAD WORKING), where two or more are kept.—Age 36, married, no family; Scotch. Thorough practical, all-round man; eighteen years' experience; eight years in present situation. Well recommended.—GARDENER, Spring Grove, Bewdley.

GARDENER (HEAD WORKING), where two or more are kept.—Thoroughly experienced in Vines, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Leaving through breaking-up of establishment. Ten years' first-class recommendations.—C. P., Chase Green, Enfield, Middlesex.

GARDENER (HEAD WORKING, or SINGLE-HANDED).—Age 28, married; experienced. Seven years' personal reference from last employer.—C. TUCKER, Holder's Hill House, Hendon, N.W.

GARDENER (HEAD WORKING).—Age 44, married, no children; thoroughly experienced in Noblemen's and Gentlemen's Gardens. Thirteen years in last situation. Highly recommended.—S. L., Shipborne, Tonbridge, Kent.

GARDENER (HEAD WORKING).—Married, no cucumbers; life experience in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, Kitchen and Flower Gardens. Four years in last situation. Excellent character.—FRANCIS, 45, Limes Road, Beckenham.

GARDENER (HEAD WORKING).—Age 30, married, one child; abstainer. Life experience in all branches. Good Orchard grower. Excellent references.—BAZELEY, Corner Hall, Boxmoor, Herts.

GARDENER (HEAD WORKING).—Age 31, married; thoroughly experienced in all branches. Good references. Leaving through death of the master.—J. HOOPER, Woodlands House, Greenhithe, Kent.

GARDENER (HEAD WORKING); age 31, single.—T. SIMPSON can recommend a man as above to any Lady or Gentleman. Good practical Foreman. Here twelve years.—T. SIMPSON, The Cottage, Field Place, Weybridge, Surrey.

HOLLOWAY'S OINTMENT and PILLS.—Dangerous Chest Complaints.—The enumeration of these diseases is scarcely necessary, as, unfortunately, most Englishmen know them to their cost. Coughs, common colds, influenza, bronchitis, asthma, pleurisy, inflammation of the lungs, and even consumption in its early stages, are best treated by rubbing Holloway's Ointment upon the chest and upon the back, between the shoulders. It penetrates internally, checks the cold shiverings, relieves the overgrown lungs, gradually removes the oppression from the chest, and restores the obstructed respiration, hitherto so distressingly disagreeable and highly dangerous. In treating this class of diseases, Holloway's Pills should always be taken while using his Ointment; they purify the blood, promote perspiration, and allay dangerous irritations.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

KEITH'S PATENT RAMS & SELF-ACTING, HYDRAULIC RAM-PUMPS, For Raising Water.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS, For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

SALES BY AUCTION.

Every Day.

DUTCH BULBS. GREAT UNRESERVED SALES.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., EVERY DAY, at 12 o'clock, large consignments of first-class HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other BULBS from Holland.

Lotted to suit the Trade and Private Buyers. On view morning of Sale, and Catalogues had.

Friday Next, September 2.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, September 2, at half-past 12 o'clock, by order of Mr. F. Sander St. Albans:—

A marvellous importation of a gigantic CYPRIPEDIUM from Amboyna; the plant is of noble growth, quite Titanic; flower-spikes immense, having sometimes seven of its big white-striped, long-tailed flowers on a stem; the sabot, or shoe, is very peculiar, and of a beautiful pinky-mauve colour; the ribbon-tails are long, and in some cases broad, in others narrow, white, with hairy black-like cushions or burrs; the natives call this the "holy urn flower," and we are sure that no species of Cyripedium has ever been imported from the country and habitat of this noble and princely Lady's-shipper. It is the flower above all others in Native estimation the sacred holy urn flower from its great loveliness and purity. Plants are simply magnificent, having been brought home by Collector, and we invite our numerous patrons to purchase, and we offer the plants without any reserve, relying on their support.

CYPRIPEDIUM WHITE may be a form of *C. niveum*. If this is the case, it will probably be a very free-growing plant, as geographically the habitat of the plant now offered is part many hundreds of miles, coming really from Chinese territory, and our collector assures us it is a really superb white Cyripedium, and a free grower, flowering with the greatest profusion, and lasting an immense time in bloom.

THE WHITE-LIPPED CYP. GODEFROYE.

THE BEAUTIFUL CYP. BELLATULUM.

These three plants are all perfectly lovely, and we most strongly recommend them.

DENDROBIUM SP., way of ANOSMUM, from Chinese territory, large purple blossoms.

30 plants of beautiful and rare MASDEVALLIAS.

50 HYBRID CYPRIPEDIUMS from magnificent kinds. Also 20 plants of CATTLEYA AUREA TYPE, specially marked by Santoyacha's pens. We cannot, however, guarantee these, not having seen them ourselves.

Many other fine and useful ORCHIDS will also be included.

On view morning of Sale, and Catalogues had.

Friday Next.

DENDROBIUM TETRAGONUM.—A very remarkable and fragrant species, with flowers 2 to 3 inches across, white, yellow, and purple. The variety offered is exceedingly floriferous.

LÆLIOPSIS or BROUGHTONIA SP.—Grand masses of a fine-looking plant collected for *Salsopsis domingensis* in a new district. All are in grand health. Flowers varying from rose to crimson.

BROUGHTONIA SANGUINEA.—Noble masses of this finest of crimson Orchids.

SCHOMBURGKIA LYONSII, true.—With grand heads of rich purple and white flowers. The handsomest and rarest of the *Lælia*-like *Schomburgkias*.

ONCIDIUM SPRUCEI.—The finest of the terete-leaved species, with short heads of large golden, yellow, and red flowers.

And other rare species.

MESSRS. PROTHEROE AND MORRIS will include the above in their sale on September 2.

Upper Edmonton.

About 5 minutes' walk from Angel Road, and 8 minutes from Silver Street Railway Stations.

SEVENTH GREAT ANNUAL TRADE SALE of about 80,000 GREENHOUSE and OTHER PLANTS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. H. B. MAY to SELL by AUCTION, on the Premises, The Dyson's Lane Nurseries, Upper Edmonton, on MONDAY, September 12, at 11 o'clock punctually, owing to the large number of lots,

80,000 STOVE and GREENHOUSE PLANTS, remarkably well grown, and in the best possible condition, including 30,000 FERNS,

all the most useful market sorts, and many novelties. 10,000 TREE CARNATIONS, including Mrs. Moore, Duke of Fife, Florin, Winter Cheer, Mrs. A. Hensley (new), M. Carle A. Alegatierre, a fine lot of old Crimson Clove.

2,000 TEA ROSES IN POTS, extra strong, *Maréchal Niel*, *Gloire de Dijon*, *W. A. Richardson*, and climbing *Niphotos*, with well-ripened growths 12 to 15 feet long, and others.

10,000 BOUVARDIAS, including *Parity* (pure white), *President Cleveland*, *Mrs. Robt. Green*, *Candidissima*, and all the best double and single varieties.

CROTONS, *LAPAGERIA ALBA*, *KENTIAS*, *AMPELOPSIS VEITCHII*, *CLEMATIS*, *IVIES*,

VINES (strong canes) *GROS COLMAK* and *ALICANTE*. 1,000 *FICUS ELASTICA VARIEGATA*, well-grown plants. 5,000 young PALMS.

3,000 GENISTAS, fine bushy stuff. 1,000 do., smaller, for growing on.

3,000 well-berried SOLANUMS. CYCLAMENS, double white *PRIMUMAS*, *CAMELIAS*. AZALEAS, forward in bud for early forcing; and a great variety of other PLANTS.

May be viewed any day prior to the Sale. Catalogues may be had on the Premises; and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Balham, S.W.

SHORT NOTICE.—CLEARANCE SALE OF GREENHOUSE PLANTS, &c.

On view morning of Sale, and Catalogues had.

WANTED, HOT-WATER PIPING.—1000 feet of 4 and 2-inch.—Particulars to—TURNER BROS., Nurserymen, Garston, Liverpool.

WANTED, TO HIRE, with option of purchase, GLASSHOUSES suitable for Early and Late Forcing. Near station or good market town.—Address, F. NEVILLE, Old Catton, Norwich.

FOR SALE, a MARKET NURSERY, comprising 1000 square feet of Glass in 8 Houses, well heated. For particulars, apply to G. LEE, Ainsdale, near Southport.

FREEHOLD LAND, 18 acres, suitable for Poultry or Market Garden, 1½ miles from Whitechurch Station, Hants. Lovely part. Price, £20 an acre. B. DOWNS, 52, Cheapside, London, E.C.

FOR DISPOSAL, a SMALL NURSERY—about 3 acres. For particulars, apply to—E. B., The Limes, Fordham, Cambs.

FOR SALE.—About 160 feet run of First-class VINERY, in full Working Order, with matured Vines; and SITE FOR SHOP, in a good business part of the Town of Reading; suitable for Working Gardener. Apply to—W. G. MILLAR, 10, High Street, Reading.

TO BE LET, or SOLD, a compact, attractive, old-established NURSERY and FLORISTS' BUSINESS, Freehold. Same hands over twenty-three years. In health cause of retiring. Capital six-roomed house, gas and water laid on; two large greenhouses, 22 feet by 18; two smaller do., one span-roof, 21 feet by 9, and seven ranges of brick pits, and every convenience. A good chance for an energetic man. Only 1½ mile from centre of city.

For full particulars send stamped envelope to WM. TOMKINS, Nurseryman, Northwick Road, Worcester.

TO LOVERS OF GARDENS. A charming old MANOR HOUSE, recently restored, added to, and decorated, with very good walled Gardens, fully stocked with a fine collection of Herbaceous Flowering Plants and Shrubs, and in perfect order; large Lawn Tennis Ground, Conservatory, Greenhouse, and Range of Heated Pits. The House contains ten Bed-rooms, five Sitting-rooms, and usual offices; Stabling for four or six Horses, Dog Kennels, Poultry Sheds, Mushroom House, and Paddock. Two miles from Leaves, Sussex; close to Church and Post; one hour and a quarter from London. Unfurnished; rent, £120. For further particulars, apply to J. HORSLEY PALMER, The Lawn, Bourne-mouth.

TO BE LET, as a thorough going concern, the LEASE, over 19 years, and 7 Greenhouses, over 700 feet run, all heavily cropped with Peaches, Tomatoes, and Cucumbers. Situate in a town of 12,000 inhabitants, within 20 miles of Covent Garden, and close to station. Room for another 600 feet run of Glass. Would suit two young men excellently, and altogether is an opening seldom occurring. The best of reasons will be given for leaving.—X. Y., *Gardeners' Chronicle* Office, 11, Wellington Street, Strand, W.C.

FOR DISPOSAL, the JOURNALS of the ROYAL AGRICULTURAL SOCIETY of ENGLAND, from 1839 to 1888, 119 vols., complete and in good order. Also GARDENERS' CHRONICLE, from 1833 to 1891. SATURDAY, AUGUST 27, 1892.

A SURREY HEATH.

IN spite of its ominous name, Blackheath, near Guildford, is a lovely spot, worthy of the beautiful Surrey scenery which surrounds it. It is a gem set with brilliants. The charming villages of Albury and Womersley lie to the north and south, and the heath is a jewel which the two parishes share between them. It lies high amidst hills of such note and beauty as St Martha, the North Downs, the ridge above Ewhurst, Chinthurst Hill, and, in the further distance, Leith Hill, and Black Down. Its chief glory at the present date (August 8) is its brilliant carpet of blossoming Heath, covering many acres. The two earlier species found here are fading, while the later common Heath, or Ling, Erica vulgaris, is still at its best. Three weeks ago the small pointed flower-buds of this species, borne on their leafy racemes, were white. The unfolded corollas are now of an exquisite pale pink.

There are about 400 genuine species of the much-branched and usually low shrub called Heath, and three of these, including Erica vulgaris, now generally classed as a distinct genus, and named Calluna, have made Blackheath, Surrey, gay with blossom since about July 20, and the latest of them is yet in its rosy glory. In speaking to a handsome wild flower, as one may do on a solitary heath, where there are none to mark you but the whinchat by day, and the nightjar at eve, one naturally says to it, "You beauty! How far does your species wander? How many other countries do you frequent and charm?"

There is a pleasant story told of Linnæus, that he had never seen the common Furze (Ulex europæus) till he came to England, and this is quite possible. Neither American, Asiatic, nor African can behold the golden glory of this plant in his native land—at least, as a wild plant; and in Europe it is limited in its range, and does not reach the Mediterranean nor Sweden. It is most abundant in the United Kingdom, blossoming on Blackheath and throughout England from early spring till late autumn, and sometimes in winter; in fact, so persistently does it blossom all the year round, that the kindly Sussex people have a quaint saying, "When Hawth's in bloom, kissing's in tune." It is said that when Linnæus came upon a common where he first beheld the prickly shrub in bloom, he fell upon his knees regardless of his companions, and thanked God that he had lived to see so beautiful a plant. I can quite believe this of the great naturalist. Honour be to all genuine enthusiasm, and to those who love a golden flower more than gold!

Bulb Growers
DICKSONS CHESTER
(Limited)

Wordsworth was in this mood when he made the shrub with the nutty-perfumed blossom say—

“On me such beauties summer pours,
That I am covered o'er with flowers;
And when the frost is in the sky,
My branches are so fresh and gay
That you might look at me and say,
This plant can never die!
The butterfly, all green and gold,
To me hath often flown,
Herein my blossoms to behold,
Wings lovely as his own.”

Returning to the Heaths, Bentham (*British Flora*) describes the genus as eminently Atlantic. Many species are found in South Western Africa, but they hug the Atlantic, and extend but a very little way eastward. In Europe, too, the Heaths are western, except two or three species, which visit the sandy waste of northern Europe, or extend around the Mediterranean. None are found in Asia, America, or Australia, so in questioning the Heaths we learn that they as well as some other inestimable blessings (moral and religious), are only enjoyed by ourselves and a handful of other people; while the greater part of the world, including six or seven hundred millions of Asiatics, cannot claim their acquaintance. One might be sure that the fair sex—and the fairest of the fair are found in these islands—would love flowers; and several ladies have, in fact, written books about them. Among the volumes on wild flowers compiled by female hands there is one, nicely illustrated, in which we read that *Erica Tetralix* is the most widely distributed and best known of all our native Heaths, that it often grows with the Heather (*sic*), or *Calluna vulgaris*, and that its flowers were adopted as the badges of the Highland clans. The *Calluna vulgaris* the authoress describes as the Heather of Scotland, plant of the Highlander, associated with his country in all its legends and poetry, forming the couch of which Sir Walter Scott wrote—

“Before the Heath had lost the dew,
This morn a couch was pull'd for you,
On yonder mountain's purple head.”

I have no doubt the lady is right, but she differs in all points from Bentham, who describes the common Heath, or Ling—*Erica (Calluna) vulgaris*—as the most widely distributed of all the Heaths, extending over the whole of Central and Northern Europe, and in Britain very abundant. He names *Erica cinerea* as Scotch Heath, or Heather, ranging over nearly the whole of Britain, and covering immense tracts of country on the Scotch, Irish, Welsh, and some of the western English moors; while the Cross-leaved Heath (*Erica Tetralix*) is not so universal in Europe, and is not so gregarious as the Scotch Heather. It is curious that it preserves this latter characteristic on Blackheath, where it grows in a few patches only, extending in one case over about an acre. The flowers form little terminal clusters or close umbels, and are of a delicate rose colour. They began to fade at the end of July, when the flowers of the common Heath—which are far more durable—began to open, and those of the Heather were still in their glory. Scott could not err on his own mountains, and his “purple head” exactly describes the colour of the blossoms of *Erica cinerea*. They are reddish-purple, arranged in dense terminal racemes, handsome and showy in the last degree. The Heaths do not blossom all the year, like Gorse, but when they are in flower, I think the dwellers in Blackheath may fairly claim them as the handsomest of all blossoming

shrubs, taking them, that is, in masses as they are usually found.

The Heaths of our wastes may be described as soil-winning plants, since they flourish in raw ground in which delicate subjects and most cultivated plants would refuse to grow. Blackheath is kept poor by the custom of paring thin slices from the surface for the sake of fuel, and thus removing the mass of roots and vegetable matter which the Heaths had accumulated in their growth. The removal of the turf destroys at one stroke the adventitious fertility which had been collected. It removes a soil, poor it is true, but full of vegetable matter, like the prairies of the West—just such a soil as a gardener would be glad to acquire, and it exposes the white sand below. It is a fraud upon the heath which the surrounding cottagers perpetrate at intervals of a few years, and as soon as the act has been committed, the several Heaths—seedlings or otherwise—again strike their roots into the sand, and win more soil for

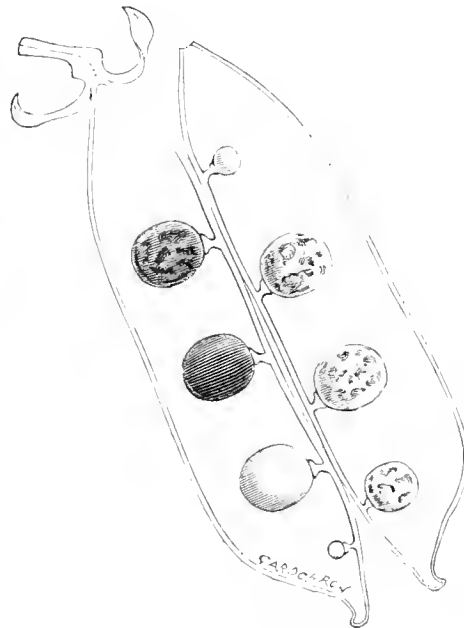

FIG. 39.—A HAPPY FAMILY: AS LIKE AS PEAS IN A POD!

the next paring of the surface. The Heaths, therefore, are as useful as they are beautiful, serving as important agents in the subduing of the earth for the use of man.

The flora of this poor but pretty spot, where the soil has to be won by the agency of a few sturdy plants appointed for the purpose, can hardly be a rich one. A few weeks ago, however, the Willow Epilobe, called sometimes French Willow or Rose-bay, *Epilobium angustifolium*, one of the handsomest of wild flowers, grew here in several moist places. These spots are wet in winter, and in summer dry, and they have now dried up, and the French Willow has followed suit, and has withered, I believe, rather prematurely. Its height was nearly 3 feet, the plant consisting of a single stem, with large purplish-red flowers, in long terminal racemes. Bentham says, “Widely spread over Britain, but not common, and in many places introduced.” It is a plant likely to be introduced on account of its very handsome and conspicuous flowers, and for that reason several

cottagers on the margin of the heath, and in the growing hamlet in one of its hollows, have transferred it to their gardens. Possibly this may be partly due to the Rose-bay being a plant of good repute among herbalists, the leaves stopping bleeding and healing wounds; but cottagers admire beauty. A very smart and pleasing girl, the daughter of a wealthy farmer, tripped by, and I noticed that my companion, an honest fellow of the above class, looked after her with a very pleased expression—“Aint she now as handsome as a goldfinch,” he remarked. As the goldfinch, dressed in its smart jacket, is one of the neatest and handsomest of British birds, he could hardly have used a more appropriate comparison.

At the head of one of the numerous little gorges cut by water in primeval times, from the high-lying heath to the country below, is a clump of Gorse. A path runs up this hollow, whose sides are thinly planted with Scotch Firs, young and vigorous, and clothed with Scotch Heath, which was blossoming gorgeously a short time back. An ant's nest, an immense heap of *débris* collected by the industrious insects, adds to the interest of this pleasant approach to the heath above, and so, higher up, does a rather uncommon plant which covers many yards of surface beneath the Gorse. It is obvious that this is a member of the graceful family of Fumitries. It is the climbing Corydal, *Corydalis claviculata*, an annual with small white flowers and slender stems 2 feet long, as unable from their weakness to stand upright as a gorgeously-attired Chinese lady whom I noticed the other day trying to “do” the Crystal Palace on her crippled feet. The poor thing—gaudy as any insect of the Amazon—was supported by her attendants, and the climbing Corydal by the stems of the Gorse, to which it clings by means of delicate tendrils at the ends of the leaves. The plant is so entwined with the Gorse, that it was difficult to secure a specimen without tearing it away by force. It is, says the authority already quoted, widely distributed over Britain, but not common, except in some parts of western and northern England, Ireland and southern Scotland. I believe it likes a moist place to grow in, and it is reported as growing not far from this spot, in a damp copse, where it spreads itself over the roots of trees. *H. E.*

AS LIKE AS PEAS IN A POD!

SOME weeks since we formed part of a party invited by Messrs. James Carter & Co., to see a field of Peas in growth. Many have seen illustrations of rows of Pea-haulms propped up and supported by the ripening pods, and many have smiled sceptically at what they considered the playful imagination of the artist. A visit to Messrs. Carter's field of Daisy Peas sufficed to show that had the artist been present at Bromley he would not have had to tax his imagination much. There were about 3 acres under growth in rows 3 feet apart, and throughout the crop was uniformly large. The Daisy Pea is a dwarf wrinkled marrow coming in after the early varieties. Its haulm is about 18 inches in height, or a little less, copiously furnished with symmetrical, well-filled pods, about 4 inches in length, each with nine or ten Peas.

The history of the Daisy Pea is as follows:—With the object of filling the somewhat bladder-formed pod of Culverwell's Giant Marrow, Messrs. Carter crossed that variety with Stratagem, the result giving them a distinct-looking Pea. In the following year they again crossed the produce of the first cross with Stratagem, the result, after another year or two of careful selection, being the present Daisy Pea.

The flavour of the Pea is excellent, and from

its great productiveness it is likely to attract the attention of market growers. As seen at Bromley, it was grown without support of any kind, but we think it would pay to stretch a wire along the rows, and insure the exposure to light and air of all the pods, many of which, as we saw them, were buried beneath the others, and calculated to invite the attentions of mildew, had such been present as was happily not the case.

the greater height that the cross-bred Pea produced when compared with that of the other parents, as the Daisy may be measured at 18 inches in the garden, and 9 inches in the field; whilst the Lightning may be measured at 2½ feet in the garden, and say 18 inches to 2 feet in the field. There is no advantage in this length of straw; in fact, Messrs. Carter should have preferred it if the straw had not been so long.

ing eight seeds, we found five blue and three white seeds, all wrinkled. In one case there were two pods on one stalk, of which one had one blue and five white seeds, all wrinkled; the other had one blue and four white seeds, also all wrinkled. In other pods there were respectively eight Peas, all white, five round, three wrinkled; seven Peas, six round white, one round blue; eight seeds, all blue, seven round and one wrinkled; this was growing on the same stalk as the preceding; eight seeds, all blue, four round and four wrinkled, intermixed; seven seeds, of which two were white wrinkled, one blue smooth, one white smooth, and three abortive; five seeds, of which four were smooth white, one smooth blue; three seeds, two wrinkled white, one wrinkled blue; and lastly, a pod with five seeds, of which four were wrinkled white, one wrinkled blue. Thus, out of eleven pods of the same variety, sixty-seven Peas were taken, of which thirty were smooth and thirty-seven wrinkled, thirty-nine were white and twenty-eight blue. Plenty of work yet before anything like fixity of character can be obtained.

We give an illustration of one pod, fig. 39, in which Peas of all kinds were growing in the same pod, viz., three wrinkled white, one smooth white, one smooth blue, and one wrinkled blue—to say nothing of two abortive ones, one at each end of the pod, of undetermined character. We endeavoured to ascertain whether we could trace any definite relation between the exact position of any particular Pea in the pod, at the extremities, or in the centre, and its form or colour; but in this we were wholly unsuccessful. Perhaps if one had patience to investigate many thousands of such cases, some valid result might be attained to.

We have some recollection that Mr. Laxton several years ago showed specimens before the Scientific Committee, which went to show that the seed-coat, and not only the embryo within it, might be influenced by the pollen of a particular variety.

Verily the changes that may be produced by cross-breeding seem endless. It must be admitted, however, that only an infinitesimal proportion afford any practical advantage to the experimenter over what he had before. To an enthusiast, that circumstance only makes success more sweet when it does come.

THE GROVE, STANMORE.

Mrs. BRIGHTWEN's pretty garden, situated on the edge of Stanmore Common, has a natural beauty in the undulating character of its extensive grounds, and its beauty has been considerably enhanced by the clever planting of rare shrubs and Conifers a good many years ago. Many of the specimens are now of gigantic proportions, although they still retain that perfect form which is characteristic of younger trees. A view from one side of the mansion reveals a fine picture, in which a 50-feet high *Cryptomeria japonica*, a grand specimen of *Araucaria imbricata*, some noble *Sequoia gigantea*, 30 or 40 feet in height; some tall columnar *Libocedrus decurrens*, and Junipers, and a huge *Liriodendron tulipiferum* form prominent objects. On the right is the Dell in which the *Rhododendrons* have been very beautiful, and in which the different foliage of the specimens planted there make a good effect. One of the most stately and beautiful is *Dimorphanthus mandshuricus*, and among the most elegant are the Bamboos. On the higher ground is the display of bedding plants, and in the various arrangements in the flower garden the judicious mingling of herbaceous plants, annuals and other plants, obtained from seeds, and working them in with the *Pelargoniums* and other summer bedding-plants, has a most telling effect. Further on there is a hardy fernery, and in several parts of the gardens there are cool nooks and dells, which form comfortable retreats in the summer-time. The kitchen garden is rendered beautiful with herbaceous perennials, many of the main walks being bordered by them, and a

FIG. 40.—THE DAISY PEA: REDUCED TWO-THIRDS; PODS REAL SIZE.

The Daisy Pea has received an award at the hands of the Fruit Committee, and our representation of the plant at fig. 40 gives a good idea of its appearance.

Messrs. Carter showed us on the same occasion various other crosses among Peas, one of which was raised between Daisy and Lightning, supposed to be the earliest white Pea at present in cultivation. The object in this case was to get a better flavour in the early Pea; but one interesting and peculiar feature in this case was

As illustrating the variety produced by this process of crossing, and the consequent time, care, and labour required in selecting and "fixing" any particular characteristic that may be required, and of eliminating others that are undesirable, we give an extract from our notebook relating to nine pods of one cross, taken at random. It shows, what, indeed, every gardener knew before, that the adage, as like as peas in a pod, is one which is much less true than the unobservant imagine. In one pod contain-

brilliant effect is created by the fine beds of Carnations, the Roses, Delphiniums, and the countless species of showy perennial flowers, among which the Stocks, Mignonette, Godetias, Sweet Peas, and other flowers, give variety and rich fragrance.

THE GLASS-HOUSES.

These contain many rare and curious specimens, and both in the plant and the fruit-houses the things cultivated have improved in every respect during the few years Mr. John W. Odell has been gardener at The Grove. In the conservatory, with its Ficus-clad sides, and the rockery bay at the back, we found the centre arranged with stately Palms, and the rest tastefully arranged with flowers, such as Tuberoles, Carnations, Agapanthus umbellatus, Crinum Mooreanum, &c. One of the prettiest plants there was a plant of the new hybrid Streptocarpus, with a dense head of about fifty flowers.

Among the Orchids are a capital lot of *Cœlogyne cristata*, a fine batch of *Calanthes*, good *Odontoglossums*, *Masdevallias*, and other cool-house Orchids; and *Disa grandiflora*, *D. racemosa*, and *D. tripetaloides*, in a very thriving condition, the two last-named being among the freest and most satisfactory plants in the garden, and flowering profusely, and increasing rapidly. In the stove-houses there are some fine Ferns and ornamental plants, and on the roof some large specimens of *Allamandas*, *Bougainvilleas*, and *Gloriosa superba*; in the greenhouses, a good display of *Begonias* and other flowers; and the various Peach-houses, Fig-house, and vineries, are excellently well managed, and have given, or are giving, their fruits in abundance. Mr. Odell has calls on him with regard to other parts of the estate, and he holds, moreover, a First-class Special Teacher's Certificate in Agriculture from the Science and Art Department, and teaches and lectures on those subjects with considerable success; but the fine trim in which the gardens are kept, tell plainly that he allows nothing to interfere with the most minute details of their management.

JAPANESE IRISES.

THE flowers of *Iris Kämpferi* are now about over. Plants in full sun, the best situation for them, do not continue blooming for more than a month, and are, with us, in their greatest beauty at the end of June and beginning of July; but by planting in shady situations the blooming time may be extended to about two months. I wonder in gardens with water, or damp situations, that this *Iris* is not more generally grown. It is much admired, and so varied in form and colour, as to suit all tastes. When it was first introduced, we bought some of Messrs. Veitch's importations, with fine flowers, but as the plants and our experience were both small, the former did not live long. Our next trial was with a few larger clumps, bought at a sale; seeds of these were sown and seedlings, and seedlings of seedlings, planted round our four small ponds at Oakwood. Where the soil was good, they thrive, but in a few places, where it was at all poor, they dwindled, and did not bloom well. We planted from the water's edge upwards, and found that the plants did not suffer from being wet at the roots in winter. We also planted some in moist soil at some distance from the ponds.

In the *Flowers of Japan*, by Mr. J. Conder, at plate iv., the *Iris* flowers seem to be about the same size as ours; but there are some colours which we have not yet got.

Mr. F. T. Piggott, in the *Garden of Japan*, an interesting book, recently published, at p. 40, gives a drawing of *Iris Kämpferi*, and speaks of "thousands of every tint, from purest white, through the purples, down to pale crimson." When looking round our plants, with flowers nearly over, he told me of flowers he had seen in Japan larger than any I have known in this country. When I told him of the belief that up to the time of the Vienna exhibition *Iris Kämpferi* had been sacred to the Mikado's garden, and not allowed to be sent out of the country, but that the desire to make the most effective Japanese garden prevailed, and *Irises* were

sent, and sold at the end of the exhibition, and distributed over Europe, he had not heard of this, and said he had seen them in various parts of Japan.

We have lately had the chance of extending our cultivation of *Iris Kämpferi*. Having to drain a field annexed to the garden, we did so by means of wide ditches; one of them had easy slopes, and was planted on both sides with *Irises*, two deep, 700 clumps, and a part of the new field, seeming to be moist enough, between 3000 and 4000 clumps of seedlings were planted on level ground. These plants seem thriving; few bloomed this season, but I hope next year there will be a fine display, in addition to our getting the chance of especially good varieties for show situations. In some of our old clumps round the ponds four varieties bloom in the same clump, and the effect is rather pleasing than otherwise. I believe that many nurserymen can now supply the *Iris*. *George F. Wilson, Oakwood.*

TREES AND SHRUBS.

EUONYMUS JAPONICUS AUREO-MARGINATUS.

IT is not generally known that the above is one of the best of evergreen wall climbers, and for any aspect. We have it growing in various places, and it thrives well in all; one plant is on a north-west wall that is 17 feet high, and the *Euonymus*, having other plants on each side, is much admired for the colours of its leaves, green and yellow, and its glossy look. Against a south wall the yellow comes out if anything fuller, but the growth is not so rapid as in less warm positions. *E. M.*

KALMIA GLAUCA.

The genus *Kalmia* comprises about half-a-dozen evergreen shrubs, which are in the month of May covered with a mass of beautiful flowers, the colour ranging from white to rose-purple. The profusion of flowers and the richness of colour, together with the length of time they remain in full beauty, render them a very important picture amongst American flowering plants. To Sir Joseph Banks belongs the honour of having introduced *K. glauca* into this country, he having found it while travelling in Newfoundland between 120 and 130 years ago. It is admirably adapted to serve as an edging to taller-growing subjects, as it rarely exceeds 1 foot to 18 inches high. Its flowers are borne freely, and are a rich pinky colour; it is the first of the genus to open its flowers. Its linear-lanceolate leaves measure about three-quarters of an inch; they are of a bright glossy-green above, and glaucous beneath. *K. latifolia*, introduced more than a century and a half ago, is one of the most popular of the genus. It is a stronger grower than the first-mentioned, having broad leaves of a shining green. Its flowers are carried in terminal corymbs of a light rose, changing to white. Both are thoroughly hardy, and delight in a peaty soil with an addition of leaf-mould; they must be fully exposed to the sun, so that they will thoroughly mature their wood. The value of both these American plants for pot work in the early part of the year is well known, when they light up the conservatory with a rich harvest of flowers, which is almost unequalled by any other flowering shrub at that dull season of the year. After blooming, they should be encouraged to make fresh growths by placing them in a warm temperature, and using the syringe freely; they must be hardened off gradually, and then planted on a warm border, where they can get as much sunlight as possible. *H.*

ENOCCHORDA GRANDIFLOHA.

Although by no means common, it is, nevertheless, one of the most beautiful of white-coloured blossoms produced in the month of May. It was first sent to this country by Mr. Fortune from North China. It is figured in the *Botanical Magazine*, t. 4795, under the name of *Spiraea grandiflora*, and in these columns in 1881, fig. 13. It forms a loose, straggling bush, growing to a height of 6 or 8 feet, but if trained on a wall grows much higher. The long pendulous

shoots are nicely clothed with soft green lanceolate leaves, which measure from 2 to 3½ inches long; the shoots are terminated by racemes of white flowers, each of which are about the size of a penny. Although perfectly hardy, it well merits a place on a warm wall, as it will then flower some time in advance of those in the open shrubbery. A little pruning is necessary, which is best carried out when it has finished blooming, for if pruned earlier, some of the flowering-shoots are liable to be taken away. It delights in moist soil, fully exposed to the sun. Water should by no means be allowed to get stagnant at its roots, or it will soon present a sickly appearance. There are two other species—*E. Alberti* and *E. Karolkowi*—both of which are but little known to English gardeners. *H.*

GENISTA PRÆCOX.

Of the numerous hardy *Genistas*, none is more showy or more welcome in early spring than *G. præcox*. It is thoroughly hardy and well adapted to most garden soils. Single specimens dotted about the shrubbery make a very imposing sight in the months of April and May, with their long slender shoots wreathed with small straw-coloured flowers hanging in a graceful manner. A capital show is obtained if a number of plants can be grouped by themselves in round beds on the grass, the strongest shoots fastened to the ground with pegs, so that they form a mass at the base, for if allowed to grow at will they are apt to lose their lower shoots, which, in a measure, detracts from their value. Plants treated as recommended above, and if seen from a distance when in full flower, have the appearance of a golden cloud. In common with several members of the same family, Leguminosæ, it cannot always be depended upon to reproduce itself from seed. I have endeavoured to raise it from seed many times, but it generally reverts to the White Broom, and to keep it true to name I find it is best to increase the stock by cuttings, which are best put under hand-lights on a sheltered border in September. The cuttings should be from 5 to 7 inches long, with a heel of old wood attached, and dibbled into soil of a sandy nature, taking care they are quite firm at the base. When completed, a watering with a fine-rosed can should be afforded them, and the lights put on. The lights may with advantage be taken off occasionally to allow of superfluous moisture to escape. Shading must be attended to on bright days. *H.*

RARE ALPINE CAMPANULACEÆ.

Campanula Allionii, Vill. (*C. alpestris*, All.), grows on the maritime Alps of Piedmont, at an altitude of between 3250 to 4875 feet. This species is peculiar to Mont Cenis, and is one of the rarest and most beautiful of alpine species. It is a bushy plant, with tufted, linear-lanceolate root-leaves; stem stoloniferous, and scarcely erect, 1½ to 2 inches above-ground. Flowers large, bell-shaped, pendent like those of *C. medium*, usually single, in colour violet-blue, opening in July—August. It requires full exposure to the sun, and a soil composed of peat, loam, and sand, well mixed together with some small pieces of flint. It thrives in the chinks of old walls or among the stones on a sunny rockery; it can be increased, like *C. Raineri*, by cuttings.

C. abietina, Gris.—From the Transylvanian Alps, is a curious and beautiful plant, resembling *C. patula* in the shape of the flower, colour of corolla, and form of inflorescence. Leaves narrow, the edges toothed, growing in rosettes, and forming a pretty tuft of verdure, from which rise the flower-stems, rather spreading, slender, creeping and then erect, in height from 8 to 10 inches at most, and bearing a comparatively large number of reddish-violet flowers, with a large white spot in the centre of each. The plant should be grown in sunshine, in light stony soil, and multiplied by seed or division of the tufts. The blossoms appear in succession all through the summer.

C. Barrelieri, Presl. (*C. fragilis hirsuta*, DC.), is a downy variety, in habit stiffer and more thick-set

than the type of *C. fragilis*, Cyril, growing on the mountains of southern Italy, and easily grown on our rockeries in sunny positions; it is increased by cuttings, division of the clumps, or by seed.

C. cenisia, L.—From the summits of the western and central heights, where it grows at elevations of from 6500 to 9750 feet. It is a small many-stemmed variety, with creeping rhizomes, the stems scarcely at all erect ($\frac{3}{4}$ to 2 inches at most), one-flowered, leaves entire, obovate-apatulate, bright green, the edges downy, growing in rosettes, whence rise the flowers, which have spreading corollas, comparatively large and bluish-lilac in colour. This is a pretty species, and peculiar to the rocks and moraines of glaciers. It is stoloniferous, and its branches often

position, especially in the English climate and the full sun. Increased by seeds or division.

C. exeisa, Schleich.—Grows on the Simplon range, at an elevation of between 4875 to 8125 feet. This species, which I have before recommended to the readers of the *Gardeners' Chronicle*, is now in full flower with us, and it is quite a mistake to call it difficult of cultivation. The little pendulous bluish-violet bells open in succession for weeks in the alpine garden, where we grow this species in full sun and in light and stony soil. It is easily increased from seed.

C. gargarica, Ten.—From the Apennines, is one of our prettiest and most free-flowering plants for walls. It forms charming tufts of bright and delicate leaves, around which rises a circlet of beautiful clear

C. Petraea, L.—From the maritime Alps, and Southern Tyrol, at altitudes of from 3250 to 5200 feet. A rare and curious species, related to the *C. thyrsoidea* group, with yellowish flowers, nearly sessile, and growing, not in the form of a "thyrsus," as with the above-named species, but in clusters, as do those of *C. glomerata*. It is rarely seen in cultivation, although it always does well if set deeply in rich damp soil, and given a sunny position. Can be increased from seed. It blooms in July and August.

C. Raineri, Perp.—From the Alps of Italian Tyrol, Lombardy, and the neighbourhood of the Lake of Como, at a height of 3250 to 5200 feet. It is a rare and handsome plant, with very short stems, thick and leafy, and its roots are sent down into the chinks of rocks exposed to the full sun, where is spread its tuft of little downy leaves, which are orbicular, the edges crenulated. The plant is covered with flowers during the months of July and August. The flowers are exceedingly beautiful, sessile, and level with the plant, which they cover entirely. The corolla is wide and large, widely opened, of a fine bluish-violet colour. The flowers are successional for many months, and form a valuable ornament during a time of the year when flowers are scarce. We have long tried to obtain seeds of this beautiful species, but as they ripen late in the autumn found it impossible. It is difficult to transplant this species as, like *Phyteuma comosum*, it forces its roots and stolons into the hardest rock, which it is impossible to break up. We have recently tried cuttings, following the advice of a Milanese botanist, who knew how much I wished to grow *C. Raineri* at Geneva. In September I took thirty cuttings from aprays sent me by Mr. Artaria, the botanist before-mentioned, and these had been three days on the journey. The cuttings were put in sand under a glass in a cool place, and all have rooted. The greater number have already grown into pretty plants, which are blooming, and which we keep in full sun on a south wall.

C. Wallsteiniana, R. and S.—From the Southern and Eastern Alps of Austria and Transylvania. A pretty little species, slender and fine, with numerous small deep violet flowers, borne on very thin supple stems about 1 $\frac{1}{2}$ to 6 inches high, which bear also narrow, linear leaves. The plant blooms freely from July to September, and requires sunshine and stony soil. Is increased by division or seed-bud; at any rate, in Geneva it fruits rarely.

C. Zoysgii, Wulf.—From the Austrian Alps, at an elevation of from 6500 to 8775 feet. This is the gem of the genus, the sole representative of a type unlike the rest of the genus *Campanula*, and of which the flower, instead of being a more or less opened bell is contracted round the mouth like the alpine cattle-bells on our alpine pastures, or the blooms of *Dicentra* or *Clematis coccinea*, only quite small. The whole plant is but a few centimetres high, and blooms in July and August; is increased rarely by seeds, and with some difficulty by division; the culture recommended for *C. Allionii* will suit it.

There are many other excellent dwarf and rock-growing *Campanulas*, but their cultivation is understood in England, and need not be dwelt upon here. I would only remark further that *Campanulas* are valuable for the decoration of rockeries in summer, as these are almost the only species which bloom freely in August and September, and are moreover of a blue or violet colour, which is always rare on rock-works. We have succeeded in our Linnaea garden (which is 5850 feet above sea-level), admirably with many *Campanulas*, but we have derived most satisfaction from the *Edraianthus* and *Phyteuma comosum*, L. In a rockery on the summit of a mountainous peak which forms the garden, in full sun and exposed to all the winds, we have every known species of *Edraianthus*, thriving excellently, forming little hummocks from 10 to 12 inches across, and so covered with stemless flowers densely packed one against another, that the foliage is quite hidden. In early July, *Phyteuma comosum* was especially admirable, growing in a south aspect between the cracks

FIG. 41.—DEGONIA SOCOTRANA: ROSE-COLOURED FLOWERS. (SEE P. 241)

extend far, spreading to a certain distance from the parent stem, and it forms sturdy clumps, which in July and August are quite covered with flowers, and look charming. In Geneva we grow it in stony well-drained soil, exposed to the full sun, although the plants are always kept moist. It is easily increased by seed or by dividing the clumps.

C. Elatines, L.—From the valleys of Piedmont and the mountainous regions of north Italy, a peculiar and charming little plant, which when wild, grows in the clefts of old moraines and on rocks, which it adorns all through the summer. The foliage is but little developed, and forms small tufts of pubescent and slightly greyish leaves, but the floral branches rising from between the rocks or the ground are from 4 to 8 inches long, slightly panicled, bearing numerous intensely blue flowers, which open in succession from August to November, and in that season are most valuable. It likes a rockery, an upright

blue flowers. It is a gem which should be in every rock garden. It requires sun, and an upright position; is increased by seed or division.

C. muralis, Portenschlag, alias *C. Portenschlagiana*, R. and S. This is a species often confused with the preceding, and which grows in the mountainous regions of Dalmatia. It differs considerably from *C. gargarica*, and forms very large clumps, which is not the case with the Italian species. The stems are numerous, slender, forming a green tuft of dark glabrous green; the leaves are orbiculate, the edges crenulated, and quite covered during May, June, and July with bell-shaped pendent flowers (flat, and widely open in *C. gargarica*), of dark violet-blue, and growing in long paniculate clusters, diffuse; leaves quite different to those of *C. gargarica*. As growers of alpine often confuse the two, it is well to insist on the details which distinguish them. The mode of culture is the same as for *C. gargarica*.

of a dry rock, and blooming as freely as though it were in the Dolomite. Sun, fresh air, rather poor soil, in these lies the secret of success in the cultivation of rock-growing Campanulas. *H. Correvon, Directeur de Jardin Alpin d'Acclimatation, Geneva.*

COMPARATIVE VALUE OF ANIMAL MANURES.

The application to the land of animal manure, either alone or mixed with vegetable substances, has from the earliest times been considered as the best means of producing fertility in the soil, or of restoring its productive powers when exhausted.

Of all what may be termed auxiliary manures at the command of the gardener, probably guano occupies the first and most important position. And although guano of the strength in nitrogen formerly obtained can scarcely be bought at the present time, yet the unshaken belief in this manurial agent entertained by many market gardeners may be explained by the fact that in certain cases they get as good a crop from it now as they did previously. The fact being, that in the majority of cases 8 to 10 per cent. of nitrogen is quite sufficient to apply in any manure at the ordinary rate, and the larger quantity formerly used was, in too many instances, wasted.

Guano, as is probably known, is composed of the excrements of sea-birds, which have accumulated in the course of time, in layers of greater or less depth, upon uninhabited islands and rocks. Good guano comes to us from those zones of the earth in which it never, or at least extremely seldom, rains, and from such islands as are sufficiently elevated to prevent the overflowing of sea-water; for if either happened, the best and most efficacious portions of the guano would be dissolved and washed away. If a dung-heap is suffered to lie without attention for only a few years with the sun shining upon it, the air driving through it, and the rain washing its goodness away, what will at last be left? Not much, beyond the carbonaceous and mineral substances which could not be dissolved or volatilised.

Such is the case with washed-out and bad guano, and this inferior article is now very frequently to be found in commerce, in the place of the rich guanos formerly to be purchased; therefore, gardeners should be on their guard when buying this fertiliser.

Enquiries are often made as to the value of poultry manure, and its comparison with other animal excrements. We have therefore given in the table below the quantities of four of the principal manurial constituents contained in cow-manure, pig-manure, and fowl-manure; each in its natural state and free from litter. The quantities are shown in pounds per ton of manure.

Selected Constituents in Three Animal Manures, in lbs. per Ton.

Constituents.	Selected Constituents in Three Animal Manures, in lbs. per Ton.		
	Cow Manure.	Pig Manure.	Fowl Manure.
Potash	Lb. 7	Lb. 2	Lb. 24
Phosphoric acid	5	18	41
Lime	6	33	47
Nitrogen	9	13	87

The data thus given shows that of the three manures quoted, that produced by cows is by far the least valuable, except in the matter of potash; and it is generally so regarded. This may be explained by the large quantity of fertilising constituents withdrawn from the food by the milk yielded. It has been estimated that a milch cow will carry off from a meadow in the course of a year by the milk which she yields as much plant-food as is contained in 1½ ton of farm-yard manure.

The excrements of cows contain the smallest quantity of nitrogen, and the largest quantity of water, amongst the manures of which we have spoken. On this account they pass but slowly into putrefaction, and become less heated when lying in heaps; for heating is exclusively a result of the putrefactive fermentation, and keeps pace with this process. In addition to this, the substance of these

excrements does not acquire a crumbling texture by lying or desiccation, but becomes saponaceous and compact; by which its distribution in the soil, as well as its decomposition and liquefaction are rendered more difficult. The slow but persistent action of this manure is thus explained at once.

Pig-manure varies in character probably more than that of any of our domestic animals, for pigs are of all creatures the most indiscriminate in their diet, and their excrements must, on that account, vary much, according to the kind of food they may happen in any particular case to obtain. Containing so much water and so little nitrogen, the dung, like that from cows, but slowly undergoes decomposition in the soil, and is, therefore, regarded as one of the "cold manures."

Fowl-manure, like that of guano from sea-birds, is a powerful fertilising agent; it contains as much or more nitrogen than many of the commercial manures in the market, besides 1 per cent of potash, and 1·83 per cent. of phosphoric acid. The dung of fowls contains not only the undigested food, but also in solid form the excretions of the kidneys, which in cattle are voided as urine, and are apt to be lost, both by drainage and by rapid fermentation. Thus the richer food, and the fact that the dung of fowls is comparatively dry, explains the higher percentage of nitrogen, phosphoric acid, and potash in it. Care in its use is necessary, as also with guano and other of the strong manurial agents, or mischief may be done to the plants for which it is employed. If dissolved in water, it may advantageously be applied to all fruit trees, especially during the period of fruiting; also for Tomatos, Onions, Chrysanthemums, Fuchsias, Geraniums, &c. If fowl-manure is used for Vine borders, for which purpose it is admirably adapted, it should be mixed with equal quantities of charcoal-dust or cinder siftings.

Farmyard manure is particularly liable to fluctuations in its chemical composition, according to its preparation, and the amount of food and litter supplied to the animals. The following may, however, be taken as about the average composition per ton:—

Selected Constituents in 1 ton of Farmyard Manure.

Potash	Lb. 11
Phosphoric acid	8
Lime	16
Nitrogen	12

It has been found that by far the larger part of these ingredients in farmyard manure are in an insoluble condition—that is to say, in a state in which plants cannot feed upon them until they have undergone further change.

For example, a portion of the nitrogen in farmyard manure exists as ready-formed ammonia—our sense of smell readily detects this fact—but a large proportion becomes only very gradually converted into ammonia, as the nitrogenous organic matter decomposes in the soil.

Thus, owing to the slow decomposition of farmyard or stable-manure, and the tardiness with which a large proportion of its nitrogen becomes available for the use of the growing crop, three or four times, or even more nitrogen, than in active artificial manures or fowl-dung, must be applied to produce the same effect upon the immediately succeeding crop. Stable-dung, however, possesses two very important properties—one mechanical and the other chemical.

By reason of its bulk and the quantity of organic matter it contains, it serves to render the soil more open and porous, and so to enable it not only to retain more water in a favourable condition, but also to absorb and retain more of the valuable constituents of the manure, and thus to arrest the passage of them in solution below the root-range of the plants. Further, by the gradual decomposition of the organic matter of the dung the pores of the soil become filled with carbonic acid, which probably serves to retard the oxidation of the ammonia into the more soluble form of nitric acid, in which it would be more liable to be washed out of the soil, and lost by drainage. At the same time, the carbonic

acid evolved in the decomposition of the stable-dung will, with the aid of moisture, serve to render the mineral resources of the soil more soluble. *J. J. Willis, Harpenden.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA HARDYANA VAR.

A MAGNIFICENT *Cattleya*, evidently of hybrid origin, between *C. aurea* and a fine form of *C. Warscewiczii* (*gigas*), has just flowered with G. W. Law-Schofield, Esq., New Hall, Hey, Rawtenstall, Manchester. It is a large and well-formed flower, the sepals and petals bright light purplish-rose, a cream-coloured marbling and veining showing in places. The broad-fringed labellum is of the richest dark purplish-crimson, with a yellow patch on each side of the tube, and a rich golden-yellow veining, after the manner of *C. aurea*, running from the base. This fine form is very near to *C. Hardyana Laver-sinensis* figured in the *Lindenia*, and it was a lucky purchase at Messrs. Protheroe & Morris' Rooms, out of an importation of Messrs. F. Sauder & Co., St. Albans. From the same source came also a lighter but equally beautiful form of the same plant now in flower with A. H. Smee, Esq., at the Grange, Hackbridge, Surrey. Both are delightfully fragrant.

CATTLEYA GRANULOSA SCHOFFIELDIANA.

A flower of a noble form of this out of an importation of Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, comes from the gardens of J. W. Temple, Esq., Leyswood, Groombridge. The falcate petals are 3½ inches long, and 2 inches broad. The upper sepal is 4 inches long, and the lower ones 3 inches. Sepals and petals clear yellow, spotted with crimson. The large labellum is white, with raised crimson lines on the front lobe, and bright yellow inside, as far as the deeply-cleft side-lobes. Of late, there have been some very distinct varieties of *C. granulosa* noted, some of which have clear yellow unspotted sepals and petals, while others have been very richly spotted. *J. O'B.*

A BRITISH FERNERY.

IN support of my contention that our native British Ferns in their innumerable varietal forms are fully capable of competing with the *élite* of their exotic brethren as indoor decorative plants, I send herewith a photograph of my own collection as seen from the dining-room window of my house. (See Supplementary Illustration.)

All the Ferns embraced in the view, with two exceptions, in the background (*Woodwardia radicans*) are purely British, and have been grown without the least artificial warmth, so that they are regularly frozen quite hard in severe winter weather. In the somewhat dry and therefore uncongenial county of Essex, a glass structure is absolutely necessary to bring out the more delicate character of many of the finest forms; the dry winds and occasional droughts dwarfing and damaging such varieties when grown out of doors, unless exceptionally sheltered situations be chosen, and due care taken as regards the watering. Many dwelling-houses, however, whose backs have a northern aspect, would be greatly improved by the erection of similar ferneries under the shadow they afford from the noonday sun, and, as will be seen by the engraving, the windows opening into them will look out upon as pretty a prospect as could well be desired, at once refreshing to the eye by its pleasant verdancy, and at the same time replete with varied detail of foliage of the more interesting character.

It will give some slight idea of the variability of our native Ferns when it is stated that in the view given there are not half a dozen duplicate forms, nearly all being quite distinct, and several hundred varieties figuring in the area of vision. Immediately in the foreground, occupying a central position, is indubitably the finest frilled Hart's-tongue yet discovered, *Scolopendrium vulgare* var. *crispum grande*, Wills, its bold fronds measuring fully

5½ inches across—a wild find in Dorset; next it, to the left, is one of Mr. G. B. Wollaston's happy hits, *Polyatichum angulare polydactylum* No. 10, again a hedgerow gem. Behind these, in the centre, is the wonderful plumose Shield Fern of Colonel Jones and Dr. Fox, *P. ang. d. pl. densum*, one of a trio of kings in that family. Behind this again, towering into the air, is the lovely superbum Lady Fern, densely plumose, and heavily tasselled, yet originating from a finely-cut *Athyrium* of purely normal outline. In the background are several

the Male Ferns, a thorough Tree Fern, with a well-developed trunk a foot in height; and bending over the right-hand path several of the curiously crossed and tasselled fronds are visible, springing from a division of the original A. f.-f. *Victoriae*, these fronds by actual measurement being 3½ feet long, as against an average of 2 feet yielded by its adult seedlings. Another "reputed" division stands at the end of the left-hand path.

Several fine varieties of *Polypodium vulgare* may be seen growing on suspended blocks of peat, and

growth of a row of larger Ferns on the rockery below. This trough is filled with a rockery in miniature, and serves its purpose admirably. The opposite wall is partly masked by hanging pots, while the end one is built entirely of large burrs, to which are attached a number of cork receptacles for Ferns of decumbent habits, and small ones which find suitable lodgment in holes made in the cork for the purpose. As the fernery (18 by 14 feet) is too large to be entirely abaded by the house, a portion of the roof at the end is boarded over, which has the effect of throwing the Fern fronds forward towards the house. A movable blind of scrim is also suspended upon three stout strained copper wires, passing through a series of rings attached to the centre and edges of the blind. With the aid of a long bamboo this blind can be pushed to and fro exactly as required. Ventilation is secured by small windows in a lantern next the house. As coolness is a great desideratum in the culture of British Ferns, an ideal fernery would be a covered cutting, facing north. The nearer a regular temperature, not exceeding 65° or 70°, can be maintained in summer, the stronger and healthier the growth; but in winter no artificial heat whatever should be used, since, with the exception of the Maidenhair (*Ad. Cap.-veneris*) and the Sea Spleenwort (*Asp. marinum*), all are quite hardy, and are even benefited by exposure to the normal winter frosts. If these be excluded by artificial heat, the dormant period of the Ferns is shortened, premature growth begins, probably in January, and their vitality is greatly impaired during the ensuing season.

Side windows are not advisable in ferneries of this description, since the plants are apt to grow too much towards them, and thus the view from the house is impaired, while with high side walls, not only can more plants be accommodated, but the general top light coming more strongly from the south, fosters a growth and adjustment of the fronds which materially enhances the beauty of the prospect from indoors. Generally speaking, it is better to grow the larger Ferns in pots, rustic ones preferable, and mask these with rockwork, rather than to plant in the soil itself. This facilitates shifting when the Ferns outgrow their space, or a little change is desired. In winter, too, many of the species being deciduous, it is often found desirable to shift the evergreen ones, viz., the Shield Ferns, hard Male Ferns, Hart's-tongues, *Blechnums*, *Polypods*, &c., so as to distribute their verdure evenly over the house; which by judicious selection and arrangement may easily be rendered a "thing of beauty" all the year round. Next the house, but not shown in the illustration, are two plants of *Lapageria alba* and *rosea*, which while taking up practically no space as regards the Ferns, are entirely at home, and at the proper season afford—*L. rosea* especially—a splendid effect of complimentary colour, when the rich red bells are contrasted with the mass of varied greens beyond. A stray branch of *Ampelopsis Veitchii* made its way through the lantern some years back, and now forms a myriad graceful festoons of delicate leafage hanging pendent from the roof, a runner having been carried along each sash-bar of the lantern with fine effect. *Charles T. Druery, F.L.S., F.R.H.S., Fernholme, Forest Gate.*

FIG. 42.—MAZEL'S HYBRID BEGONIA. (SEE P. 241.)

sister plants of this, beautiful but of less merit; while quite in the foreground, to the right, standing on the path, we catch a glimpse of its really marvellous offspring, A. f.-f. *plumosum Drueryi*, for which, though we may be accused of ranking our geese as swans, we have no hesitation in claiming a foremost place among the loveliest Ferns in the world. On the left, half-way down the path, is seen a fine plant of *P. acul. pulcherrimum*, rising high in the air, and surrounded by a host of smaller-growing varieties of numerous species. In the central rockery, partly hidden by the front members of the group, may be seen the pendulous tasselled tips of the fronds of a grand plant of the King of

with these in the upper right-hand corner are associated some seedlings of A. f.-f. *Kalothrix*, with its fine silky fronds, like "beautiful hair," whence its name. Curiously enough, though in its native haunts the common *Polypody* is by no means tardy in rising in the spring, many of its varieties do not begin growth until July, the old fronds, however, persisting until the new ones start. Hence the specimens shown are by no means at their best.

On the wall to the left of the house, but scarcely shown in the view, there is erected a long slate trough which accommodates a considerable number of the small-growing varieties at a very convenient height for inspection, and without hindering the

TREES FOR MARSH AND MOUNTAIN.

MANY of the estates in Great Britain and Ireland are of such a size, that the plantations combine the useful and ornamental to a larger extent than such as contain a larger area, and where many of the woods are planted with the view of turning marsh and mountain land to better account. But we occasionally hear complaints that plantations do not pay, so that we shall briefly glance at a few salient points in explanation of the reason. In the first place, then, when plantations are formed for ornament and utility combined, they are planted with a mixture of useful and ornamental trees, at a cost of about £10 per imperial acre, and I need hardly say that

FORESTRY.

such plantations should be well handled in the way of thinning and pruning as it becomes necessary, and until such time as the trees become thoroughly established. For want of this precaution many plantations are all but ruined during the first twenty years of their growth. How can plantations pay where the trees are allowed to waste their energies in the formation of a plurality of leaders at the top, as well as a superfluous number of side branches, all of which should either have been cut back or removed during the early stages of their growth? The pruning of forest trees, when requisite, should be commenced during their nursery career, and when trees are well managed in this respect during the early stages of their growth, and until such time as they become well established in the forest, they seldom require further pruning, with the exception, perhaps, of removing a double leader at the top.

On large estates that contain marsh, moss, and mountain land capable of being utilised for tree culture, the block, or group system of planting should be adopted, so that the several kinds of tree can be planted in groups by themselves on the class of ground most suitable for their requirements. The advantages of this system of planting are both simple and rational. In the first place, the trees can be planted at a distance apart of about 6 feet, or at the rate of about 1210 plants per acre, and allowed to grow up like a crop of corn until such time as the trees attain a profitable size, when they may be cut down, turned into cash, and the ground replanted. Heather ground on exposed situations had better be planted with hardy Coniferous trees, but reclaimed marsh ground will give by far the best return when planted with blocks of Poplar, Willow, Alder, and Ash. When these trees are so planted, they neither require thinning nor pruning further than the removal of a double leader at the top when it occurs during the early stages of the tree's growth, so that the only expense incurred during the growth of the trees is to keep the fences and drains in a thorough state of repair. All kinds of trees grown on this principle present fine clean stems, almost cylindrical in shape, or, at any rate, with very little taper, and they are free of knots or blemish of any kind, which enhances their value.

In view of the vast stretches of barren ground to be found in Great Britain and Ireland capable of tree culture, it is a matter of much importance that the selection of the most suitable trees for the different classes of soils and situations should be as perfect as possible.

Although Ireland at the present time has a smaller area under wood than other parts of the British Islands, yet the climate and soil are exceptionally well suited for the growth of trees, and there can be little doubt but that at one time the country was nearly one unbroken forest. In a paper before me I see that the county of Tyrone covers an area of 806 658 statute acres, or 3.9 per cent. of the total area of the country. According to the agricultural statistics (Ireland) for the last year (1891) there were 173,252 acres under tillage, 75,258 under meadow and Clover, and 327,491 under pasture, making a total of 576,001 acres of arable land, or 74.3 per cent. of the total extent of land in the county; 30,566 acres, or 1.2 per cent., under plantations; 48,056 acres, or 6.2 per cent., under turf bog; 9908 acres, or 1.3 per cent., under marsh; and 99,612 acres, or 12.8 per cent., under barren mountain land. The remaining 32,619 acres, or 4.2 per cent., were returned as under roads, fences, &c. It will be seen that the extent of land under plantations is but small, while the land under turf bog, marsh, and mountain, a great deal of which is capable of producing a profitable crop of timber, occupies a large area. The cost of planting this class of ground in Ireland varies considerably owing to local circumstances, such as the amount of draining required, and the rate of wages in the locality. When planting deep peat bog in that county, where it was necessary to mix a little soil or clay with the staple at the spots where the trees were planted, I found the cost per statute acre to average from £6 to £8, even in cases where I used a

light railway, capable of being wrought by manual labour, to bring the soil or clay to the bog. Marsh ground, however, varies very much in its composition, and seldom requires to be supplemented with clay or soil, so that the principal expense incurred in preparing the ground here, is the amount of draining which it requires to render it dry and firm. This class of ground is capable of producing fine trees (hardwood and coniferous), either mixed or in masses, and the expense of the formation, under ordinary circumstances, will average from £5 to £6 per acre. I should state that deep peat bog or moss should always be planted with coniferous trees, with the hardy Birch as a first crop, although, at the same time, I may state that I have occasionally sown the seeds of these trees on the spot where the trees are to remain, which is a much cheaper method than planting; but, of course, it takes a longer time to establish the plantations. With regard to barren mountain ground, coniferous trees, as a general rule, are the best; but in all cases where the soil is of a calcareous nature upon the mountain limestone rock, and contains some 20 per cent. of lime, the Larch should not be planted, although in most cases it is by far the best tree to give a quick and profitable return. *J. B. Webster.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

GESNERAS.—Winter-blooming kinds of the *Zebrina* section, if not already occupying the pots in which it is intended they should bloom, may be shifted into the same as soon as possible. In cases where several are grown together, 8 or 9-inch pots may be used; but for single plants, 5 or 6-inch will be large enough. Keep the foliage free from all insect pests, such as mealy-bug, &c., for if these be allowed to infest the plants, the foliage, which is so effective when well grown, will speedily lose its attractiveness. When the pots are found to be well furnished with roots, after their final potting, apply clear manure-water once or twice each week. Grow the plants in an intermediate temperature during the summer and autumn months, and they will become more sturdy than if grown in a higher temperature. Summer-flowering kinds, such as *G. Cooperi*, *G. gloxiniaeflora*, &c., will soon have finished flowering, and when such is the case, and the plants show signs of resting, water should be applied in less quantities as long as any of the leaves retain vitality, but as the tops die down, all watering must be discontinued. The tubers may then either be allowed to remain in the pots, or shaken out, and placed in dry sand, but in either case they should be wintered in an intermediate temperature.

GLOXINIAS.—Plants raised from seed this season, and which are intended to bloom during the autumn, should be encouraged as much as possible, and should the pots in which they are growing not be large enough, lose no time in moving them into larger ones. Grow them well up to the glass, and in a nice growing temperature, so as to encourage a sturdy habit of growth, and plenty of substance in the foliage, as this is very essential, especially in the case of late-blooming plants. Any which have been raised from leaf-cuttings this season should be encouraged to make growth as long as possible, so as to increase the size of the tubers, as the larger the latter become, the better they will bloom next season. Tubers which were started early in the season will ere this have finished blooming, and have completed their growth; afford no more water than is necessary to keep the leaves from becoming shrivelled, and when the foliage turns brown, withhold water altogether, leaving them either in the pots or in dry sand, keeping them during the winter months in an intermediate temperature.

DOUBLE PRIMULAS.—Plants that were propagated from lateral growths during the early part of the summer, will now be well rooted, and should be repotted in well-drained pots, letting the plants well down in the pots, so that the base of the leaf-stalks of the lower leaves will be in the soil. Afford the plants a rich and open compost, consisting of two parts rich loam, and one each of decayed manure and leaf-soil, with sand in quantity sufficient to keep the soil porous. Grow the plants well up to the

glass, and when the weather is favourable, give abundance of air, so as to encourage sturdiness of growth.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

POT-VINES.—These should be afforded all the light and air possible, in order that well-matured canes may be secured. A dry circulating atmosphere will also conduce to the same end, but the plant should on no account be allowed to suffer for lack of water at their roots. If natural or artificial manures have been employed in stimulating growth, these may now be discontinued, except in the case of canes for fruiting next year; these may be assisted with superphosphates. Stop all growths, and when the wood is fast ripening, allow the night temperature to fall to 50°, with a rise to 80° on sunny days.

FIGS in pots or borders that are forced early, should now be induced to ripen their wood, and, this obtained, allowed to rest by lowering the temperature of the house, and withholding moisture until the leaves have fallen. Pot-plants may be stood out-of-doors in a light, airy position, and supplied with water while their foliage remains green.

ORCHARD-HOUSE.—Continue pinching all shoots of Plums, Apples, Pears, and Apricots, and if growth be rather green, maintain a little warmth in the heating apparatus during the day, to assist its maturation. All syringing may now be dispensed with, provided the plants are clean; but where there is any red-spider, the garden-engine may be brought into play occasionally, using soapy water, which should be applied with considerable force. Turn those in pots out of the house when the fruits have been gathered, giving them a situation where the natural factors of growth-maturation can have full scope, standing them on boards, slates, coal-ashes, or gravel, but not on soil, and attending to their requirements in the way of water. Like fruiting-canoe of pot-Vines, these, too, may have an occasional pinch of phosphate applied to each as a top-dressing to the soil, and be washed in by the watering. Where the trees are planted in borders, give them the same stimulants, if they appear to need it, and keep the air moving, and as dry as circumstances permit. Any plants which may have failed to carry a crop this year, and, in consequence, are making too succulent wood, should be root-pruned at once. By doing this now, the trees will get a check to their growth, and will be able to make fresh roots, and in all likelihood ripen their shoots before winter, when a crop for the coming year will be ensured. Look over the fruit every other day, and gather any that is ready. If fruits of Apples and Pears leave the trees when brought to the horizontal with the hand, it is a sure indication that they are fit for removal to the fruit-room.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

PEAR TREES.—These being very thinly cropped this season, the gardener should take care and lengthen out the supply of fruits as much as possible with the early ripening varieties by timely attention in gathering, taking a few at a time of the ripest fruits every few days, and laying them in the fruit room. Jargonelle is the first good Pear, and when well grown it is large in size and of good flavour. Williams' Bon Chrétien follows this one. These, as well as some others, should not be left on the trees till fully ripe, or the flavour will be spoiled. Water borders of Pear trees copiously, especially if the soil is of a light and dry nature, and the fruits will not only be large but juicy. All trees with heavy crops should be freely thinned, pulling off all small and deformed fruit, and those that are badly placed. Pears on dwarfing stock should receive a fresh mulch, and be assisted with manure water, &c., should the crop be a heavy one. If the summer pruning is not yet finished, no time should now be lost in pushing on with this kind of work, and the shoots being now firm they may be shortened back closer than is desirable earlier in the season without any risk of the bottom buds pushing into growth. This will be better for the trees than early and hard pruning and pinching, but where the trees grow too strongly, and from that cause remain unfruitful, root pruning at the proper time should be practised.

RASPBERRIES.—By this date the fruits of most summer varieties will be gathered, and the old canes, if not already removed, should be cut away, so that light and air may reach next year's fruiting

canes. Keep the plantations clear of weeds and useless suckers. The nets which have been in use should be tied up when perfectly dry, and ticketed, and temporary frame-work should be put aside for next year's use.

ORCHARDS.—The grower will do well to keep the hoe in constant use for the destruction of weeds before they seed. But this sort of work is often much neglected, and the fruit-bushes, where these exist, get choked with weeds; and, to make matters worse, with a view of burying this useless rubbish at the end of the season, digging is practised, and other rough-and-ready means employed, and the surface-roots of the trees and bushes get damaged. Such a practice, it is needless to say, cannot be too much condemned.

THE APIARY.

By EXPERT.

AUTUMN-FEEDING.—Where insufficient honey has been left in the body of the hive for stocks to winter on, slow-feeding should be the rule for the next three or four weeks. This is done to induce the bees to continue rearing brood as late as possible. If they were fed up quickly at once, egg-laying would cease, and the workers called upon to do all the extra labour of again storing food in place of that taken away by the beekeeper, would be worn out, and therefore unfit to carry on the work of the hive the following spring. Dry sugar (Porto Rica) is very convenient for slow-feeding, and most suitable for this time of year. It should be placed in a feeding dummy, Simmons' pattern, which, if made an inch wide, will hold 3 lb., and is hung in the hive next the frame, as close to the brood-nest as possible. If dry sugar is not used, syrup must be made as in spring, and given in a bottle or other slow feeder. At the end of September all feeding should be completed, by giving in one dose syrup made by boiling for a few minutes 5 lb. of white lump or granulated sugar to about 1 quart of warm water, so as to make up each hive to the required weight of 20 lb. of stores. Pure cane sugar is, without doubt, the best to use for feeding bees, but the writer has lately been informed, on good authority, that it is almost an impossibility to get it in this country, as all sugars now consist of an admixture of Beet in a larger or smaller degree. It is, therefore, important to pay a good price, and get the best article, which it is reasonable to suppose will contain the smallest proportion of Beet. It will probably not cost more in the end, as the better quality will possess a greater sweetening power, and more water can be used in making the syrup.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

THE INTERMEDIATE-HOUSE.—*Cattleya marginata*, *Lælia pumila*, and its varieties, are useful plants for flowering in the months of October and November, and drought at the root would be very harmful to these just now whilst they are growing apace. Being very dwarf in habit, they should be grown in shallow pans or baskets, and placed near the roof-glass, either in this, or in the *Odontoglossum-house*. All of them are subject to yellow thrips and a species of scale, and they should be examined at intervals for these, and the leaves sponged. *Lycastes*, and especially *L. Skinneri*, are not Orchids that require a great deal of careful watering at the roots; but occasionally some weak manure-water may be afforded. *Oncidium sarcodes*, on the other hand, if the pans, &c., are well-drained, seems to thrive if watered rather heavily while it is growing. This is another plant which, when weakly, requires frequent cleaning to remove thrips and scale. The intermediate-house usually contains a number of miscellaneous plants, of which are some *Oncidiums* showing for flower, viz., *O. varicosum*, *O. tigrinum*, *O. oraihorrhynchum*, *O. unguiculatum*, *O. macranthum*, *O. incurvum*, *O. Forbesii*, and *O. crispum*; the spikes of these, which may now be looked for, should be kept free from thrips, pests which will, in a few hours, cause the flowers to become malformed, if they do not destroy them wholly.

THE SHOW-HOUSE.—Our show-house has not looked brighter at any time during the season than at present; especially noteworthy is the colouring of the lip of some *Cattleya gigas* of the *Sanderiana* type. It is a species worth taking the trouble to flower well, and is a queen among *Cattleyas*. Then there is the more delicate-tinted *C. Gaskelliana*, and

the rich and variable colours of *C. Eldorado splendens*; *C. aurea Dowiana*, too, stands out conspicuously—all these grand subjects causing the more sober *C. Harrisoni*, the earliest of which are now coming in, to pale before their brilliancy. Another beautiful colour seldom seen in Orchids is that of *Vanda cœrulea*, a quite indispensable plant, that everyone should grow in numbers; the roots of this species should be watered twice daily. The beautiful yellow flowers of *Sobralia xantholeuca* are very telling, as are those of *S. alba nana*, whose pure white sepals and petals and yellow lip remind one of a flower of *Thunia Marshalliana*. Then there are *Pilumna fragrans*, *Miltonia vexillaria rubella*, *Barkeria spectabilis*, the earliest of the genus; *Mormodes citrinum* and *M. pardinum*, *Odontoglossum Harrisonum*, and various others, which help to give brightness to the display. The fragrance of some of these species form an attraction for bees, which should be excluded by tacking thin gauze over the ventilators, otherwise they soon destroy the beauty of the flowers by fertilising them.

GENERAL WORK.—*Masdevallias* standing in need of re-potting should be taken in hand at once; also plants of *Odontoglossum crispum*, and plants of similar-growing species in need of re-potting, so that this operation may be finished off by the middle of the next month. At this time of the year, new supplies of half-decayed tree leaves should be placed on the floors, the walls lime-washed, all necessary cleaning done, and the house made sweet and wholesome. The re-potted plants should be very carefully watered. At this time of the year the *Odontoglossums* delight in the dewy night air, which should be admitted liberally.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

BEDDING PLANTS OF DISTINCT AND TELLING COLOURS.—The present is a good time to note the most suitable plants for massing, as a guide for planting another year. With us the masses of crimson *Henri Jacoby* and *Tom Thumb Pelargoniums*, pink *Christine Pelargonium*, *Golden Queen Viola*, mauve *Tom Thumb*, and the *Zoo Ageratum*, deep blue *Lobelia primula magnifica*, and *Salvia patens*, are very effective at this part of the season; *Bijou de Lyons Ageratum*, white, is a most valuable white-flowering bedding plant, compact, and yet very free growing. Silver-leaved, bronze, and tricoloured *Pelargoniums*, intermixed with yellow and blue *Violas*, *Phlox Drummondii*, *Heliotrope*, *Mignonette*, *Cineraria maritima*, *Perilla nankiensis* (in beds side by side), *Begonias*, having a groundwork of silver *Sedum*, together with many oblong and hexagon-shaped beds filled exclusively with carpet-bedding plants, in variety, look well, and are quite to be relied on to make a fine display. Cuttings of these are now plentiful, and their removal is a matter of necessity, so that propagation may at once commence. This cutting into shape, and trimming of every description of bedding-plants, the removal of yellow leaves and spent flowers, must receive frequent attention. By carrying out a system of pinching the shoots, and removing spent-flowers and seed-pods, the flowering period of all subjects can be much extended, the young shoots resulting yielding a succession of flowers until the plants are spoiled by frost. When *Phloxes*, *Pentstemons*, *Antirrhinums*, and similar plants, are pinched or cut-back, they break into fresh growth lower down the main stem, and flower much later than do the shoots that were not pinched; and, although the side or lateral growths do not produce such fine flowers as those that came earlier, loss of size is made up in quantity.

SUB-TROPICAL PLANTS require but little attention from this date until the approach of frost renders the removal of subjects intended for use another year to the protection of a greenhouse necessary, further than the pinching of the points of extra strong-growing plants, and putting additional ties to those needing them. Plants of *Solanum marginatum* intermixed round the sides of the beds with *Tobaccos*, *Melanthus major*, *Cannas*, &c., are very telling, their large silvery, prickly leaves contrasting effectively with the surrounding plants.

FOLIAGE BEDS.—These are rich in softness and brilliancy of tints, the silvery or creamy-white foliage of the *Mesembryanthemum cordifolium variegatum* showing off to great advantage when contrasted with the bright-foliaged *Alternanthera amœna* and *A. versicolor grandis*, which blend with

the soft golden-yellow *Pyrethrum*, the grey *Echeverria secunda glauca*, the blue *Kleinia erecta*, and the green and silvery *Sedums*. These need frequent thinning out and clipping into shape, so as to confine each colour to its own panel or boundary-line, so as to properly define and preserve the character of the several designs, perfect neatness of the whole being the great charm of carpet or geometrical bedding.

GENERAL WORK.—This will consist in pushing forward the propagation of all kinds of bedding plants that are not yet put in, the completion of the layering of *Carnations*, the insertion of *Pink* cuttings in handlights or frames, as recommended at p. 129 of the *Gardeners' Chronicle* for July 30. Cuttings of *Alternanthera*, *Verbena*, *Mesembryanthemum*, *Ageratum*, *Salvia patens*, and *Lobelia* may be struck in a close moist frame, cuttings of the young growths from the bottom of the plants only being used.

THE KITCHEN GARDEN.

By G. WYTTES, *Gardener, Syon House, Brentford.*

LETTUCE.—If salads are required in quantity, preparation should be made for the late supply from the open ground. If seed was sown as previously advised on p. 69, there will be no lack of materials for planting out; and though these plants will be too large to remain out in severe weather, they will lift readily into cold frames, or even under light sheds. If planted closer than usual, and under a wall, they stand a few degrees of frost, and there is less trouble in protecting. A few beds of seed sown now of the hardy winter varieties will be found serviceable, as some of the plants, when large enough, may be pricked out into frames for the midwinter supply, or given a warm border, and protected with frames or mats for this purpose. Sowing in drills is the best method, as in a mild autumn those not transplanted often get a usable size. Other beds should be sown broadcast on a sloping border; protected from north-east winds, these will give a supply early in the spring, and the largest may be lifted and planted in frames. These seed-beds should be protected in severe weather, when not sown on a sheltered border. The best varieties for winter use are *Brown Cos*, *Lee's Hardy Cabbage Lettuce*, and *Hammer-smith*—the latter stood all last winter on a sheltered border without injury; and for early spring use, the *Cabbage* varieties are most useful. By sowing these varieties at this date, much time is gained.

ENDIVE.—This the most useful salad plant other than *Lettuce* for winter use should be planted out as early as possible, and if a large number is required, no time should be lost in sowing a late lot for planting in frames. The seeds sown earlier will give the winter supply, and a late sowing now will form a succession. If some plants of the July sowing are planted out on a warm border in richly-manured land, they will be large plants, ready to blanch, before protection is required, when they may be lifted, or pots placed over them. The *Green Curled* and *Improved Round-leaved Batavian* are the best varieties—the first for early use, and the *Batavian* for later, the last-named being very hardy and a good keeper. *Corn Salad* should be sown in quantity if liked, and it is always useful, as it stands severe weather.

RADISHES.—These, when sown at the end of this month, last much better than those sown during the summer, and are more succulent. The *China Rose* is an excellent autumn variety; and for the winter, a sowing early in September will give a long supply, using the *Black Spanish* variety.

CAULIFLOWERS.—This is an important crop, and though the exact date of sowing cannot be advised, as in cold districts it may be necessary to sow before this date in many gardens, a date between the 20th and 30th will be found a good time. Sow in good soil, and if at all dry, thoroughly saturate the soil previous to sowing. I find the growth is much more sturdy if the seed-bed is made firm where the soil is light, taking care to give plenty of room, to prevent drawing. Some growers of late years have discontinued sowing *Cauliflower* seed in the autumn, preferring to do so in heat early in the year. I have tried both methods, and prefer the old one, as the heads are finer, and there is no trouble in pricking off and hardening off; and when not sown too late, and the plants are planted out on a sheltered border, and a few in cold frames or potted up, there is generally good material ready to plant out early in the spring. I use *Walcheren* or *Veitch's Pearl* in preference to *Early London*.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

MONDAY	AUG. 29—	Cresswell Horticultural.
TUESDAY	AUG. 30	{ Brighton and Sussex New Horticultural (two days).
WEDNESDAY	AUG. 31	{ Bath Floral Fête (two days). Bishop's Stortford Horticultural. Harpenden Horticultural.
THURSDAY	SEPT. 1—	Oxford Horticultural.
FRIDAY	SEPT. 2	{ National Dahlia at Crystal Palace (two days).

SALES.

MONDAY,	AUG. 29	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY	AUG. 30	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Greenhouse Plants, at the back of Leigham Cottage, Balham High Road, at 12 o'Clock, by Protheroe & Morris.
WEDNESDAY,	AUG. 31	{ Dutch Bulbs, at Protheroe & Morris' Rooms. A Very Extensive Importation of Bulbs, from Holland, at half-past 12 precisely, by Mr. Stevens.
THURSDAY,	SEPT. 1	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Established and Imported Orchids, Stove and Greenhouse Plants, &c., at half-past 12 precisely, by Mr. Stevens.
FRIDAY,	SEPT. 2	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids from Mr. F. Sander.
SATURDAY,	SEPT. 3	{ Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—60°.2.

Chiswick Conference.

THE Conference on Begonias and Apricots, held on Tuesday and Wednesday last in the Chiswick Gardens, in connection with an exhibition of those plants, was one of the most interesting and instructive of the series, though not so largely attended by the public as could have been desired. In the whole range of horticulture, there is nothing more remarkable in its way than the evolution of the present race of tuberous Begonias, and the formation of new forms of equal morphological value, not only to species, but even to that of a genus. The history is well-known throughout most of its stages. It has formed the subject of a special literature, amongst which we may specially indicate some papers of M. DUCHARTRE, and an excellent memoir by the late M. FOURNIER, in the *Journal de la Société Centrale d'Horticulture de France*, as well as Mr. B. WYNNE'S useful work on the subject, published at the office of the *Gardening World*.

The history and progress have, moreover, been repeatedly summarised in our pages, particularly on August 26, 1882, p. 262, and on November 10, 1888, p. 534. On the first-named occasion we wrote with reference to the changes that had been effected:—

"A more complete upset of morphological proprieties can hardly be imagined, and yet in the midst of this wild confusion—a confusion far from being incompatible with beauty and symmetry—the botanist sees first principles only the more firmly vindicated; the exception does not vitiate, it confirms the ideas of original unity of type and sex, community of origin, and adaptive variations."

Since these words were written, continued progress from the florist's point of view has been made, though there is not much that is of primary importance to be added to the botanical history. The introduction by Professor BAYLEY

BALFOUR of *Begonia socotrana* from Socotra, of all unlikely places, has, indeed, been the means of creating some hybrids as remarkable in their way as any that have preceded them, but it has not greatly affected the morphological history. From a florist's point of view, there has been, thanks to the labours of LEMOINE, MALET, and other continental raisers, as well as to our own hybridisers, steady progress; habit, form, colour, have all been improved; bedding varieties at the hands of Messrs. SUTTON, of VILMORIN, and of others, have greatly improved, and have a great future before them; the winter-flowering section in the hands of Messrs. CANNELL have also made great strides.

To Messrs. VEITCH belong the honour of introducing most of the original types, and of testing their value by hybridising and crossing them; and the history of the work done by the great Chelsea firm was pleasantly told on Tuesday by Mr. HARRY J. VEITCH. He was followed by JOHN LAING, of Forest Hill, to whose foresight, energy, and skill the development of the tuberous section is mainly due. His paper, which will be published in full in the *Journal of the Society*, will always constitute a very important record. Mr. CANNELL related his experiences with the winter-flowering section; and Mr. WATSON, in a few, well-chosen, crisp sentences, gave an outline of the botanical history of the genus, his remarks being illustrated by a very large illustrative collection forwarded from the Royal Gardens at Kew. We can hardly over-estimate the benefits which horticulture derives from the co-operation of Kew on occasions like these. The Kew collection contained precious links in illustration of the history, and was still more important to those who have eyes to see, as indicating resources and possible future developments, which, if turned to account, must eventuate in results far more extensive and varied than have yet been attained. The possibilities, indeed, seem endless for those who will not be contented to run always in the same grooves. Messrs. VEITCH also exhibited a very valuable series of species and hybrids, the names of which are given in another column.

It is singular that several of the original species which formed the starting points have, apparently, entirely disappeared from our gardens, the parents having been so completely superseded by their more attractive progeny. Historically this is unfortunate, but less so than it otherwise would have been; first, because the plants, unlike Orchids, have not been exterminated in their native haunts, and can, and probably will be, re-introduced; and next, because the great advance has been made within the last quarter of a century, when science has had her say in the matter, and as one result, a much more complete record, pictorial and otherwise, has been made, than was the case in earlier times. In former days, and (utterly erroneously, as we believe), in the supposed interests of trade, the source of novelties, and the origin of crosses, were often carefully concealed, even if they were not deliberately misrepresented.

When the hybrid Begonias were first introduced, we wrote and spoke of them as "the coming flower." Our prediction has been abundantly verified, and this circumstances may, perhaps, serve as our excuse if we counsel for the future an attempt at greater variety and hardihood, the formation of new races, in fact, and the cessation of any attempts at making the flowers any larger than they are at present, and specially that hybridisers and cross-breeders will follow the natural lines of the flower, enhancing and emphasising them, rather

than attempt to reduce them all to one uniform circular outline, and creating flowers which might (so far as form is concerned) be Hollyhocks or double Balsams, or Camellias, anything rather than Begonias.

The second day's proceedings comprised papers on "Apricots and Plums," the author of the indispensable *Fruit Manual* being in the chair. M. F. JAMAIN contributed a paper on "Apricots as Grown in France," together with a classification of the kinds grown.

Mr. SMITH, of Mentmore, read a paper on the "Culture of Plums for Market," in which he expressed the opinion that if the right sorts were grown, and sufficient care exercised in uniform sampling and grading for market, this branch of the business might be made profitable, though its fluctuating nature was made apparent by the circumstance that he had obtained, under different conditions, prices varying from 1s. 3d. to 18s. or even 25s. a bushel.

Mr. RIVERS' paper on "Dessert Plums" was, in the main, a catalogue, with comments on the best varieties. Mr. RIVERS' own services as a raiser were justly acknowledged by several of the speakers.

Adverting to the provoking death of the branches of the Apricot, especially the Moor Park variety, some of the speakers, making use of ordinary garden-phraseology, in order that they might the better be understood, attributed it to the "contraction of the sap-vessels from frost." The frost no doubt is an efficient cause, but is it not time that we ceased to try to hide our ignorance of vegetable physiology? Are there any such things as "sap-vessels?" We should say certainly not, in the sense in which the term is generally employed; and that "contraction," again using the term in the garden-sense, is non-existent. A little elementary knowledge of vegetable anatomy and physiology is still a desideratum in the education of a gardener. The phrase doubtless originated from the assumption that the circulation of the blood in animals and the circulation of the sap in plants were identical phenomena, and carried on in like manner, assumptions that are now, and have been for many a year, known to be false.

BEGONIAS.—Our illustrations this week (figs. 41, 42, 43, 44) show several of the species of *Begonia* as first introduced. They were the parents of the tuberous section, and, as elsewhere remarked, have disappeared from cultivation.

BEGONIAS AT COWDRAY PARK.—The following note has been received from Mr. W. GOLDRING:—"In the gardens of Lord EGDMONT'S beautiful seat at Cowdray Park, Midhurst, the tuberous Begonias seem to be a specially favoured class of flowers, and Mr. GEESON is one of the few gardeners I know who spend their leisure in a systematic way in the improvement of such a class of plants as Begonias, which, as every one knows, have been for years the specialties of some of the great London nurseries. But Mr. GEESON does not mind this, but works on, and in his own way with the particular strains he has raised until now, the fame of the Cowdray Begonias has spread widely. I took an opportunity of seeing them on the occasion of the Cowdray gardens being open to the public through the kindness of Lord EGDMONT, and these Begonias struck me as being one of the most remarkable points in a large garden full of fine landscape effects and evidences of high-class culture. The Begonias have houses and frames to themselves, but those under glass were somewhat past, and not so noteworthy as some hundreds, perhaps thousands, of seedling double varieties in open air beds where Mr. GEESON has the cream of his collection. Here you can see

DECORATIVE FERN-HOUSE.

crowds of new seedlings, representing the perfection of a double Begonia, dwarf sturdy plants with broad thick heavy foliage, and holding up on stout stems, great double flowers, many as big as Hollyhocks, ranging in colour from pure white through yellows to salmons, pinks, scarlets, and deep crimsons. The preponderant tints are crimsons and pinks. The yellows are fewer, but the few are superb, and so are the whites. As one sees these double varieties in one long and broad mass lit up by such varied hues of soft and rich tones, one feels he is enjoying a new phase of open-air garden beauty such as a few years ago we should not have supposed possible, and probably, in course of time, the exposure of seedling strains to the open will result in a hardier race of tuberous Begonias than we have now, suitable as is the Pelargonium for massing in beds. The Cowdray Begonias show what one man may do by patient and intelligent hybridising and skilful culture. There are other things worthy of note at Cowdray, such as *Streptocarpus* hybrids and *Fuchsias*, but I will confine this present note to the Begonias, which are alone worth a journey to see."

SHANKLIN HORTICULTURAL SHOW.—On Wednesday, August 17, a show was held in the beautiful grounds of Rylestone, by permission of M. SPARTALI, Esq., and proved one of the most successful that this Society has yet held. The collection of fruits were as good as have ever been shown in the island. Stove and greenhouse plants, groups, basket of plants for effect were very good. Asters and Marigolds were very nice; these are a specialty of the Isle of Wight. Mr. PRITCHARD, florist, Christchurch, exhibited a splendid collection of cut blooms of herbaceous perennials, and was awarded a Certificate. The show was honoured by a visit from H.R.H. the Duke of CONNAUGHT and Prince HERMAN OF SAXE WEIMAR and suite, Mr. W. DROYER, one of the judges, conducting the Royal visitors through the exhibition. Mr. W. DROYER presented Princess MARGARET OF CONNAUGHT, on leaving, with a beautiful bouquet.

BANFFSHIRE HORTICULTURAL SOCIETY.—The annual floral exhibition was held in fine weather in the Canal Park, Duff House, Banff, on Wednesday, August 17. The show was one of the largest that has been held under the auspices of the Society for many a year.

THE BRITISH PTERIDOLOGICAL SOCIETY.—This Society, which has been formed for the purpose of fostering the study of our British Ferns and their varieties, and as a means of communication between those who pursue this very interesting branch of native botany, held a well-attended meeting on Monday, August 1, at the Institute, Bowness, Windermere, on the occasion of its first annual gathering. The Society, which has so far been known as the Northern Pteridological Society, was formed by a number of the local Fern cultivators and hunters in the lake district, who had long felt the need of some controlling body of experts which would lend its aid in the way of properly naming and classifying the varietal forms, of which so many have been found in that region, and would also act as a centre of communication between those who were interested in the pursuit. At the meeting, however, at which Dr. F. W. STANSFIELD, one of a third generation of ardent Fern lovers and cultivators, presided, it was felt, that notwithstanding its local origin, as it was first in the field, there were many reasons for enlarging its scope, and therefore giving it a more general name. The Society proposes to hold an annual meeting and conference upon the first Monday in August, and this was the first of such meetings. At these conferences, it is their wish to have fronds of such new forms of British Ferns as may have been found or raised in the preceding twelve months sent in for judgment and naming, so that some better principles may be brought to bear on their nomenclature than has hitherto been in vogue. It is notorious that many forms exist in different species which are identical in type,

but which, having been named by various authorities, are confusingly different; other names than descriptive ones, such as *Smithii*, *Brownii*, or *Robinsonii*, which convey no idea at all of the plant, will, in future, not be sanctioned, the name of the finder or raiser being appended to the descriptive one in plain English. Dr. STANSFIELD gave a very able address, in which he called upon the members not merely to observe but also to record their observations for the general benefit, much valuable information becoming scientifically valueless for want of confirmation in the first place, and due record in the second. Mr. CHAS. T. DRUERY, F.L.S., followed on similar lines, giving a short sketch of the aposporal and other discoveries, by way of indicating what can be done by close investigation. As the subscription is a very small one, being merely intended to cover expenses of rules and inter-communication, the society hopes that it will receive the warm support of the many enthusiasts in British Fern culture; and the President, Dr. F. W. STANSFIELD, Derby, and Mr. C. T. DRUERY, Fernholme, Forest Gate, Essex, one of the Vice-Presidents, will be happy to assist the Hon. Secretary, Mr. GEO. WHITWELL, Serpentine Cottage, Kendal, by giving any desired information to this end. The next meeting will be held at Lancaster. On the day following the meeting, an expedition was made by a number of the members to Langdale, some fifteen miles from Windermere, and with very happy results, Mr. WHITWELL, the Secretary, finding a very neatly tasselled form of *Lastrea pseudo-mas*, *L. montana angustata*, and last, but by no means least, a finely-crested form of *Hymenophyllum unilaterale*. Mr. CLARK found *L. montana truncata* and *congesta*, and Mr. DRUERY a prettily variegated form of the same species. As this species was for many years considered invariable, it is certainly a good augury for the success of the society, that their members can discover four good forms in one outing, together with others of even greater rarity. If the Society will take steps to prevent the wholesale uprooting of Ferns they will effect much good.

THE POISON OF THE YEW.—In a communication to the *Times*, Lieutenant F. J. M. STUART WORTLEY summarises the experiments he made in the laboratory of the Agricultural College at Downton, with a view of determining the poisonous principle of the Yew. Lieutenant STUART WORTLEY had been told that the male Yew was poisonous, but that the female Yew was harmless to cattle, and in order to test this "theory," he made the experiments which are detailed in the *Times*, oddly enough. We are really progressing, it would seem, when the details of chemical analysis and procedure are published in the ordinary newspapers. As a general result, Lieut. STUART WORTLEY says that "taxin," the supposed poisonous property, is contained chiefly or entirely in the male Yew, so that if this be so, the female Yew may safely be planted as an ornamental tree in parks and pastures where cattle are turned out; but how are we to know, before flowering, which is the male and which the female? We cannot chemically analyse all the plants before planting them. Occasionally, as we know, the female Yew produces male flowers also. Does it, then, also form taxin? By analogy we should not be surprised, as an occasional occurrence, to see a male Yew producing fruits, or *vice versa*. The fullest account of the poisonous properties of the Yew that is at hand is that contained in M. CH. CORNEVIN'S *Plantes Vénéneuses*, 1887, who in addition to recording his own experiments, summarises the experience of others from the earliest times. He makes no mention, however, of any difference between the male and female trees, although he does mention that 4 decigrammes of the pollen administered to a sparrow produced no effect. M. CORNEVIN himself states that the young leaves are comparatively harmless, but as they get older and assume the deep green colour of the adult state their poisonous properties increase, as indeed might be anticipated. Julius Cæsar de Bell. Gal. lib. 6, cap. 30, records that King CATIVOLUS killed himself with the Yew. "Rex Cativolus taxo, cnjus

magna in Gallia Germanique copia est se exanimavit." Unfortunately, we are not told whether the king made use of the male or of the female tree! Ovin had so bad an opinion of the Yew that he considered it to form part of the vegetation of the infernal regions, but he drew no distinction between the sexes. Perhaps at that time they were both bad alike.

"THE FLORA OF BRITISH INDIA."—This important publication, prepared by Sir JOSEPH HOOKER, and begun in 1872, is now within a short distance of completion. The part just issued contains the Scitamineæ, monographed by Mr. BAKER; the Irids, Amaryllids, Lilies, Commelinads, and some other orders, by Sir JOSEPH HOOKER, who also furnishes, in conjunction with Signor BECCARI, the Palma. Of large orders there remain now to be dealt with only the Aroids, the Cyperads, and the grasses, the last a formidable group; but the same zeal and judgment that have carried the work so far, will, we trust, insure the completion of this most useful work.

UNUSUAL VARIETIES OF ROSES.—In the collection from MM. SOUPERT & NOTTING, of Luxembourg, staged last July in Brussels, we noticed some uncommon Roses introduced in 1890—91. Here are those of 1890:—Clotilde Soupert, Duchesse Marie, Salviati, Gloire des Cuirvés, Jeanne Guillaume, Madame Moreau, Madame Sadi Carnot, Madeline d'Aoust, Madame Olga, May Rivers, Sappho, Souv. de Worton, The Queen, Augustine Guinoisseau, La France de '89, Gloire de l'Exposition de Bruxelles, Gustave Piganeau. Those of 1891 were:—Charles de Franciosi, Christine Noisè, Comtesse de Vithum, Comtesse Iva Stahremberg, Elise Fugier, Madame Creux, Princesse de Sarcina, Souv. de Clarvaux, Souv. de Lady Ashburton, Danemark, Gustave Régis, Madame Angélique Veysset, Pearl Rivers, Triomphe de Pernet père, Joseph Degueld, and Madame Pierre Liabaud.

"FORAGE PLANTS OF AUSTRALIA."—Mr. F. TURNER has, under the auspices of the Department of Agriculture, New South Wales, published a valuable account of the forage plants of Australia, accompanied by rough but characteristic illustrations. The most numerous and valuable forage plants, other than grasses, of the arid districts of the interior are the various Chenopods, of which several are here figured. Casuarinas do not seem to be very succulent, but their foliage contains citric acid in combination with lime, which renders them very attractive to cattle. For purposes of timber and of shelter these trees are very valuable.

SCENT-FARMING.—This new colonial industry appears to be attracting a good deal of attention in New South Wales. The *Agricultural Gazette* of this colony has recently been urging the institution of experimental farms similar to that which has been established at Dunolly, in Victoria, so successfully. The *Gazette* points out that in scent farms large quantities of waste material from nurseries, gardens, orchards, and ordinary farms might be profitably utilised, whilst occupation would be found for some who are unfit for hard manual labour.

BI SEXUAL CONE OF PINUS THUNBERGII.—In the current number of the *Tokyo Botanical Magazine* is an illustration showing two cones of this species. In one case, the anthers are at the distal extremity and the seed-scales at the base, whilst in the other the seed-scales are at the apex and the anthers at the base. A similar change was described by us in these columns for June 30, 1883. It is curious to see how much more certain species are subject to these and similar changes than are others. Can it be that they are natural hybrids, or are they species still in the forming stage, and not yet fixed?

PASITHEA CÆRULEA, of which Sir JOSEPH HOOKER gives, in the August number of the *Botanical Magazine*, an illustration and an amended generic description, "was discovered and described by FÉLIXÉ, a Franciscan friar, mathematician and botanist, born at Mane, in Provence, in 1660, who

was commissioned to travel in South America for scientific purposes by Louis XIV. He published in 1714 the account of his travels and discoveries, calling himself "R. P. FEUILLÉE, Religieux minime, Mathématicien, Botaniste de sa Majesté." His description of the plant is a short one, but the figure is good, and he gives it the native name of "Illus," adding that it inhabits the mountains of Chili in latitude 37° from the South Pole. FEUILLÉE first visited the West Indies, and then went down the western coast of South America, travelling in Peru and Chili, where he discovered *Datura arborea*. On his return to France he was liberally pensioned by the king, who built an observatory for him in Marseilles, where, worn out by his labours, he died in 1742. He is said to have been a man of modest, simple character, as becomes an ecclesiastic and true philosopher. His original drawings, many of which are unpublished, are preserved in the Bibliothèque Nationale in Paris. Since its discovery, *Pasithea cœrulea* has been collected by many travellers, one of whom, BURGESS, states that it is called by the Chilians "Espuela de Galun," the Gallant's Spur, but does not account for the name. ROTZ and PAVON gave it the vernacular name of "For de Cuentas," and state that the root smells like that of *Iris florentina*. According to MOLINA the "bulbs" are excellent food, boiled or roasted, and make a pleasant soup.

HABENARIA.—Dr. KRANZLIN has issued, in ENGLER'S *Jahrbücher*, a complete monograph of the species of this genus. No fewer than 317 species are described.

CANADIAN MOSSES.—Professor JOHN MACOUN has published the sixth part of his *Catalogue of Canadian Plants*. It is devoted wholly to mosses, and has been compiled with the co-operation of Professor KINDBERG, of Linköping, Sweden, Dr. CARL MUELLER, of Halle, and other specialists. It is printed for the Government of Canada, and published by W. FOSTER BROWN & Co., of Montreal.

THE LATE DR. JAMESON.—We have received from our eminent colleague, M. ED. ANDRÉ, a cheque for 1 guinea on behalf of the fund instituted for the benefit of Miss JAMESON. We are precluded from further alluding to the subject this week, but shall revert to it on another opportunity. Sir JOSEPH HOOKER has also contributed £5 5s.

PLANT PORTRAITS.

BOMAREA FRONDEA, Mast., *Bot. Mag.*, t. 7247.—See *Gardeners' Chronicle*, vol. xvi., p. 663, fig. 102.

CAPPARIS FLEXUOSA, Vellozo, *Bot. Mag.*, t. 7248.

CATLEYA ACTUALIS, *Revue d'Horticulture*, August 10.

DAPHNE GENKWA, *Garden*, July 30, 1892.—Singularly like a Lilac in the flower.

DENDROBIUM WARDIANUM VAR. **ALBUM**, *Orchid Album*, t. 450.—Differs from the variety candidum in the absence of the purple spots at the base of the lip. In the present case the lip has still an orange blotch at the base.

EPIDENDRUM AMABILE, *Orchid Album*, t. 452.—A variety of *E. dichromum*.

EPIDENDRUM CAPARTIANUM, Hort. Linden. *Lindenia*, t. 33.—See E. Godseffianum, Rolfe. See Rolfe in *Gardeners' Chronicle*, January 30, 1892, p. 136.

EPIDENDRUM INVERSUM, *Revue de l'Horticulture Belge*, August.

FURCRAEA PUNESCENS, *Bot. Mag.*, t. 7250.—This would be preferably written *Fourcroya*, a species with oblong lanceolate spiny-margined leaves and large erect panicles of bell-shaped greenish-white flowers, each with a long slender hairy tube.

IRIS LORTETI, *Bot. Mag.*, t. 7251.—Foster in *Gardeners' Chronicle*, August 6, 1892, p. 152.

LELIA ACTUALIS ALBA, *Orchid Album*, t. 451.—A pure white variety grown in the nursery of B. S. Williams & Son.

LELIO-CATLEYA DIGBYANA × **MOSSIE**, Rolfe, *Orchid Album*, t. 449. See *Gardeners' Chronicle*, June, 1889, p. 742, and fig. 111.—A cross between *Cattleya Mossie* and *Brassavola Digbyana* raised by Mr. Seden.

LYCHNIS FLDS CUCULA "ADOLF MUSS."—A double-flowered variety. *Gartenflora*, August 1.

MILTONIA PHALLENOPSIS, Nicholson, formerly called *Odontoglossum Phalænopsis*. *Lindenia*, t. 334.

ODONTOGLOSSUM EXCELLENS × VAR. **DELLENSE**, *Lindenia*, t. 335.

PASITHEA CÆRULEA, *Bot. Mag.*, t. 7249.—An Anthericum-like plant with linear leaves, and loose open many-flowered panicles of small blue flowers. The bulbs are used for food in Chile. Kew.

PEAR SOUVENIR D'ÉDOUARD VAN DER BERGHE, *Bulletin d'Arboriculture*, July.

PITTIOSPORUM FLAVUM, *Bull. Soc. Tos. di Orticolt.* t. vii., 1892.

STANHOPEA Eburnea, *Lindenia*, t. 336.

SARRACENIA FLAVA, *Meehan's Monthly*, August.

HOME CORRESPONDENCE.

FREESIAS FROM SEED.—Messrs. Sutton & Sons have in bloom at the present time at their Portland Nursery, at Reading, a number of plants of *Freesia Leichtlinii* and also of *F. refracta*, obtained from seeds sown in February last, the plants at the present time blooming freely. The seeds were sown about the middle of February in a compost made of loam and leaf soil, and placed in a temperature of from 60° to 70°. They soon germinated, and when large enough the seedlings were pricked off into 48-sized pots, six plants in a pot, kept close until June, and then hardened off in a cold frame. As soon as they began to show signs of throwing up their flower-stems, they were taken into a house with *Gloxinias*, where they are now blooming freely and finely, diffusing a delightful fragrance; the flower-heads quite as fine as those grown from bulbs. The result is most satisfactory. It might, perhaps, economise labour if six seeds were dibbled into a 48-pot, and thus save the time employed in pricking them off from the seed-pans to pots. *R. D.*

RHODODENDRON FALCONERI.—Several notes in your recent issues mention a lilac-flowering *R. Falconeri*. This is probably the true *R. eximium*. This species (or perhaps variety of *Falconeri*) flowered here in May, 1889, and 1890. It is in form exactly like *Falconeri*; the colour is a rosy-lilac. *O. Forster, Lehenhof.*

STARTING A NURSERY BUSINESS.—At p. 167 "Gardener" seeks to know "how much it would take to start a nursery business that would bring in £50 or £60 per annum?" To give a satisfactory answer to this question is a difficult matter, without knowing something of the ability or the inclinations of your correspondent. For example, it would be useless to picture the rough and the smooth of starting with glass alone, if your correspondent has little or no experience of the cultivation of plants under glass; besides, the departments of the nursery business are so many and so various as to cause beginners, as a rule, to select a certain branch of it, one to which he has been accustomed, and which he feels himself capable of managing, and getting a living by when he shall have turned round. But "Gardener" has not given any hint whereby to assist those who might otherwise be able to tender him sound advice. It should, however, be borne in mind, that small as well as large businesses have to face failures of crops and the attendant consequences; things, too, that have never been bargained for or thought of, and this to a small man, and particularly a beginner, is too frequently as a "millstone about his neck." Gardener, however, is by no means an ambitious man, and this being so, one is almost inclined to advise him to seek a situation at £1 or so per week, where the £50 or £60 per annum would be a certainty. Such an income, however, should be easily obtainable with but little expense, by renting a couple of acres of land, preferably of a light sandy loam, and growing thereon vegetables and flowers, confining the latter for the first year or so to annuals which, flowering during the year of sowing and planting, should return the cost for seeds, labour, &c., and permit a margin for profit. Among the flowers *Asters* should receive a prominent place, also *Stocks*; either of these find a ready sale in large towns, as young plants in the spring for bedding out, or for their flowers in a cut state later on. *Cornflowers*, particularly blue and pink, should be grown for these, are very popular at the present time. *Gaillardias*, too, are extremely popular and showy, both plants and flowers being

in demand; these latter, however, are not strictly annual, they are more generally—that is, the forms of *G. grandiflora*—perennial in character. Sweet Peas are both useful, popular, and profitable to cultivate, giving quick returns; other things which may be easily raised from seeds, and for which there is always a certain demand in town gardens, are Canterbury Bells, Sweet Williams, fancy Pansies, and Wallflowers. These, if fairly treated, should prove remunerative, besides being inexpensive to start with. A good assortment of vegetables should also meet a ready sale, and these, too, being annuals, or at least giving their crop within the year, should result profitably, bearing in mind that a variety of things should be grown, but this should not be overdone. This will give quick returns, and avoid the error of having all the eggs in one basket. In such a case £20 or £30 would go a long way towards providing manure and seeds to start with if well spent, but there are other expenses also, such as rent, tools, and general working expenses, besides which the owner must live. The foregoing should be regarded as suggestive rather than aught else, for after all it may be quite opposed to "Gardener's" ideas of a nursery business, yet it is at the same time a means of earning a comfortable living for one blessed with health and strength, and may possibly furnish the start, as it has frequently done in the past, to the attainment in after years of a nursery business well deserving the name. *Young Nurseryman.*

BEEES IN THE NORTH.—The bee season in this district so far has been anything but encouraging, for instead of making honey this summer, in many cases the bees have had to be fed, and this has been common with young swarms. Fortunately for this district we have the Heath blossom to look forward to, and should the weather prove favourable, a nice lot of Heather-honey may yet be stored. It would be interesting to know if any quantity of honey has been obtained in other districts, as this I think would be deserving of note, especially when the perverseness of the weather of this season is taken into account. *J. Charlton, Corbridge-on-Tyne.*

ACANTHOLIMON VENUSTUM.—Really good flowering alpine in summer-time are by no means plentiful, as the flowering season of the majority is throughout the spring. One of the very best, however, at the present time is that named above, now covered with its pleasing spikes of pale pink flowers, which are very beautiful. It has a dwarf, compact, cushion-like habit of growth, and is composed of tufts of rigid spiny glaucous leaves. It is an easily-grown alpine, succeeding quite well in ordinary loam of a sandy nature; its progress, however, is somewhat slow, nor is it among those most readily increased. It may be obtained from seed, however, and where such can be obtained, this constitutes a safe mode of increase. For some years past, however, I have been unable to procure good seed, notwithstanding that my plant, a rather large example, has produced as many as thirty spikes of its flowers. The other means employed for increasing this plant is by careful division in spring, and by cuttings in autumn. Where good rockeries exist, choose for it a sunny ledge, with a good depth of soil in which to send its roots. *J.*

CATALPAS.—North American species of *Catalpa* succeed well in Britain, and we are happily in possession of arboreal representatives of the natural order, which grow freely into very ornamental leaved, free-flowering examples. Indeed, so well do they succeed, the wonder is they are so generally overlooked. As a town plant, moreover, few trees succeed better, as witness the row of *Catalpas* in the yard of the Houses of Parliament, Westminster. Unhappily, that row happened to be planted with trees already somewhat large, yet they flourish, and appear likely to do so effectually. There seems to be no public record of the horticulturist who had the courage to plant these said examples in that particular place, though, I think, it is a matter deserving of note and commendation. The Plane tree is a worthy town tree, and occupies legitimate places of honour, such as the Thames Embankment. It is regrettable, however, if *Catalpas* succeed so well, a further trial of them has not been extended to such places as the public gardens and parks of the metropolis. Occasionally, examples are seen about the suburbs, and passers by admire, and it may be enquire, to little purpose the name. A fine example existed outside or beneath the northern terrace-wall at Windsor, which had a charming effect when in full bloom, the bold racemes of white flowers were seen

nearly on a level with the beholder. The species usually planted is *Catalpa syringæfolia* or Lilac-leaved form. This species is a rapid grower, and when planted in deep free soil in the neighbourhood of London, it attains a height of 20 feet in ten or twelve years. *C. syringæfolia aurea*, as the name implies, is a golden-leaved sport, and is very suitable for sub-tropical gardening and similar decorative purposes. The Japanese *Catalpa*, introduced as late as the year 1862, the blooms of which are said to be yellowish, white, crimson, named *C. Kempteri*, would appear desirable. *C. Bungeii* and *C. speciosa*, with Pott's pink-flowered Mexican species, *C. Pottsii* and *C. microphylla*, the small-leaved form, comprise the whole genus now recorded. Imported seeds yield plants easily and well, and they all are easily propagated from root cuttings in the winter. *W. E.*

LILIAM AURATUM.—In the small suburban garden attached to one of the residences in the Bristol Road, Birmingham, by Mr. Henry Clay, a very fine specimen of this noble Lily is now in flower, having eleven strong stems and eighty-one full-sized flowers. The plant is now in an 18-inch pot, and has been repotted each year, disturbing only the top portion of the ball. Two young offsets were removed some time since, and one has now five fine blooms, and the other three—but are pigmys in size by the side of the parent plant. *W. D.*

THE BEST ARTIFICIAL AND THE BEST NATURAL MANURE ONE AND THE SAME THING.—Farmyard manure, as usually applied to land, certainly does not deserve to be termed a "natural" manure, nor, seeing the utter lack of art generally displayed in the treatment of it, has it the slightest title whatever to be called artificial. Owing to certain barbarous habits existing amongst us, and to ignorance, manure is usually associated in our minds with offensive smells. If, however, our treatment of excrementitious matter were more truly civilised and scientific, the smells, as is the case under natural circumstances, would be so reduced as to be almost annihilated, and the quality of the manure at the same time raised to a maximum. The most practical and valuable ideas respecting the manuring of the soil may be taken from observing how Nature goes to work in a wood or forest. The surface soil in woods and forests is continually gathering fertility, notwithstanding that the crop growing upon it also continues to increase, so that after many years, or rather, many centuries, as the case may be, enormous crops of timber may be removed; and, at the same time, an enormous aggregation of fertility be left behind on the surface, and, although the soil contains, or bears on its surface, this plenitude of fertility, this highly-fertile deposit of superlative manure, the resulting smell, if, indeed, there be any smell at all, has nothing in the least unhealthy in it. People do not get typhus fever and diphtheria from the smells of woods and forests, nor from unwholesome emanations arising from land from which forests have been cleared, save in very exceptional instances indeed. The aggregation of fertility in the surface soil of woods and forests arises from a variety of causes. One of these is the decay of the leaves annually deposited, and from the decay of twigs and branches, and, at last, of the trees themselves, which is continually taking place as the forest advances in age. Much of the matter of which the trees are composed is brought up from depths of the earth, and more still from the atmosphere, all of the former and much of the latter at length becoming deposited on the surface as in turn leaves, twigs, branches, and stems decay. The excrement of birds and animals who make their home in the forest, but much of whose food is obtained outside, deposit their dung, and at last their bodies, on the ground under the trees close to their lairs or roosting places. Then there is atmospheric dust which, though small in quantity, tells up in the course of centuries, whether its origin be meteoric or otherwise; rain washes it down out of the atmosphere. Wind also blows it in amongst the trees, and when once there, has little or no power over it to blow it out again. From these causes and others, accumulations are always, though slowly, going on. Scratching birds, burrowing animals, and the uprooting of trees during storms, to say nothing of various reptiles, worms, and insects, are continually mixing, or causing to be mixed, more or less intimately the surface soil and the ever-accumulating deposit. Thus Nature manures and tills in her own way land entirely left under her charge, and she continues to increase her crops and the fertility of the land at the same time. It is quite possible by artificial means to do the same; indeed, any system of horticulture or agriculture by which this is not accomplished is not

a worthy one. When return is made to the land of all that the crops contain which are removed from it, whether much or little of it has been passed through the bodies of men or animals, then, provided it is fairly good land to start with, an increase of fertility takes place in the same way as land left to Nature. When more is returned than is taken off in crops, then the growth of fertility is more rapid. There are two reasons for this. If everything be returned to the land that is taken off it in crops, more is returned than comes out of the land, because not only is that which comes out of the land returned, but carbonaceous and nitrogenous matter also, a good deal of which has been absorbed from the atmosphere and also returned. The first of these indirectly and the latter directly are great fertilisers. When land is in a very fertile state, plants are correspondingly strong and healthy, and are capable of taking from the inexhaustible ocean of the atmosphere a corresponding supply of that which the atmosphere affords; therefore the more fertile one's land is, the more easily is its fertility kept up. The maximum fertility that the land is capable of should always be striven for, though there is reason to think that as improved strains of vegetables, fruits, flowers, &c., are produced capable of making use of

in the course of a few months. Accumulations from the dust-hole, manure from a cow-shed, old potting-soil, road-scrappings, cabbage-stumps, hedge-clippings, and all kinds of garden-refuse, &c., are placed on the heap. This heap is commenced in the autumn, and grows till the following autumn, when it is all turned over, and thoroughly mixed, and another new heap commenced. On frosty mornings, and at any time when the ground is hard with frost in winter, the thoroughly-rotted compost of the mixed heap is carted, and wheeled, and spread over the land. This manure may be looked upon not only as the most perfect natural manure, but also as the most perfect complete artificial manure that can be made. Seeing, however, that much of the true earth—phosphate of lime—which is taken away in crops from the land, is the most difficult to get back to it in a suitable condition for immediate use by plants, it is a good plan, when the heap is being turned over, to scatter in amongst it some $\frac{1}{2}$ -inch bones, or bone-dust, ground coprolites, or Thomas' Phosphate-powder. If there is reason to believe that the land is very deficient in phosphates, a larger quantity may be given than on land in which there is no reason to suppose phosphates are greatly lacking. *J. E. Ewing, Sea View, Havant, Hants.*

LILIAM HARRISII.—The value of this Lily is great, as for church decoration, wreaths, crosses, and the embellishment of greenhouses or conservatories it is quite unrivalled; and, as it now comes from different parts of the world at different periods of the year, flowers may be had of it during a long season, and bulbs of it are almost perpetual, for it is found that by treating them well, and growing them on, they break again, and blossom afresh. Market growers, who are ever alive to the merits of any good thing, soon discovered its worth, and by some of them it is very largely cultivated, and whole houses devoted to it, so great is the demand for the flowers, and it is a question, if this goes on, whether the supply of bulbs will be found sufficient; but the world is large, and if they increase in the same way or at the quick rate *L. auratum* appears to do in Japan, from whence they are sent over annually by hundreds of thousands, we shall, no doubt, have enough. Be this, however, as it may, so long as the price remains moderate, *Lilium Harrisii* ought to be had, and now that first consignments are nearly due, gardeners and others will be on the look-out, and on the principle of first come first served, those who apply early are the most likely to get the best bulbs. These, or others, on arrival should be potted at once, but large pots are not needed, 5-inch sizes being quite enough for a single bulb, as it is not a matter of growing an imported Lily on, but to draw out the flowers that are in it, as each one should have several formed in embryo, and packed away ready to come forth with the stem. The soil most suitable for potting is a mixture of rich fibry loam and peat, or the first-named will do very well alone; and it is a good plan to have a pinch of silver sand placed at the base of the bulb, which should not be quite buried, but have the top just clear of the soil. After potting, stand the Lilies in a cold frame, where they should be covered with cocoa-nut fibre, and so left till they start well into growth, the object being to let them come gently along, and make plenty of root before any attempt is made at forcing. In growing *L. Harrisii* it should be borne in mind that the plants are particularly liable to green-fly, and require close watching, as the insects get down into the tops of the stems, and soon cripple the buds. Dipping in tobacco-water is a good remedy, or careful fumigation, but insecticides are dangerous if applied at all strong. The proper treatment after flowering is to keep the plants under glass, and supplied with water, that the leaves and stems may be maintained in a fresh healthy condition as long as possible, or till signs of ripening-off is shown, when the plants may be stood out-of-doors to finish that process. *J. S.*

FIG. 13.—*BEGONIA BEAUVALLIENSIS*. FLOWERS ORANGE-PINK IN COLOUR. (SEE P. 214.)

a greater and greater amount of fertility, a limit to fertility will never be attained. More fertility in the land, and better (more perfect) flowers, fruits, and vegetables, trees, grasses, &c., capable of making use of that fertility, are what present day progress demands. To increase fertility, better methods of dealing with excrementitious matters must be brought into vogue. A perfect natural manure must be the result of animal and vegetable decay mixed in somewhat similar proportion to what takes place in nature, and there should be two objects in making it artificially—one to prevent foul smells and unwholesome accumulations of filth, and the other to provide for the return to the soil of the fertility withdrawn from it by crops, and to increase that fertility. From earth-closets, if properly kept, no foul smells can ever proceed, and danger from sewage contamination is avoided. Of course, there must be some sewage, but when closet-stuff is excluded from it, the danger connected with it is but slight, and it is still valuable as an application to land, as it contains the house slops and all waste house-water. As a matter of fact, a much larger quantity of it would be acceptable here for application to crops. The material taken from the earth-closets once or twice a week, or as often as necessary, is in a perfectly inodorous condition, and is placed at once on a heap formed of this and all other refuse material capable of being rotted down

RUTHENICUS.—In answer to Mr. Wolley Dod Ruthenicus, from Ruthenia, a name of Russia whence it was originally obtained. The metal Ruthenium derives its name from the same origin. *A.*

VANDA CERULEA.—A magnificent variety of the above is at present in bloom at Stray Lea, Harrogate (the residence of E. Beckett Faber, Esq.), where there is at all times something in bloom to interest lovers of Orchids. The above plant has six strong growths, and is carrying three spikes, averaging seven flowers on a spike; the individual flowers measuring $\frac{3}{4}$ inches across, and of a clear blue colour, and splendidly marbled. It is undoubtedly a variety of more than ordinary merit. *Jno. Clayton.*

RIVERS' NEW EARLY NECTARINE.—Every fruit-grower will regret to hear that Mr. T. Rivers does not intend sending out his grand new early Nectarine, because he wishes to grow the fruit for market till he thinks himself recompensed for raising such a grand acquisition. I hope Mr. Rivers will see his way to change his mind; but if not, fruit-growers should try get him to send it out by subscription, say, 200 subscriptions, at £5, for one plant each, and if there are more than 200 subscriptions, the price to be lowered accordingly. What say Mr. Rivers and fruit-growers to the above? as I think we ought to have the above Nectarine, even if we have to pay for it. *Jas. Hamilton, Byrkley Gardens, Burton-on-Trent.*

SALTMARSH'S QUEEN APPLE.—In this variety, the amateur, cottager, market gardener, and in fact every body, will find a very prolific and reliable bearer, and a first-rate culinary variety; an excellent companion variety to Lord Suffield, now so universally known and grown. The fruit of the Queen is not so conical as the other, but the tree bears a close resemblance, and just now a bush tree about 8 feet high and as much through, having a very heavy crop of fine fruit upon it, is to be seen in the gardens of Umberslade Hall, near Birmingham. Mr. Pritchard esteems it so highly that he intends planting more of it, and of Bramley's Seedling. This year Apples are generally small in the Midland districts, and to see a tree of good-sized fruit, such as the one in question is a treat. *W. D.*

HERBACEOUS SPIRÆAS.—*S. astilboides* is a good plant either for pot culture or for growing out in the open, but to have the best results it must have plenty of root moisture, as like most of the Spiræas it is half aquatic, and does grandly in deep loose boggy or open soil by the sides of streams or ponds, where it and other species or varieties are just at home, and flower with great freedom during the early summer months of the year. The inflorescence of *S. astilboides* is almost pure white, and is produced with great freedom on stiff and somewhat wiry stems that branch out at the lower part, and make a fine show, the scent of the flowers being particularly sweet and agreeable. The foliage, too, is highly ornamental, as besides the leaves being handsome in form they are very bright and assume a reddish-bronzy hue, that contrasts well with the blossoms. As this Spiræa seeds freely, it is to be hoped that others will cross with it, and that by-and-by we shall have many more varieties of these useful plants in our gardens. The queen of the Spiræas, however, is *S. palmata*, which is truly a most beautiful object, with its lovely violet-pink shaded panicles of bloom, so light and elegant that they never fail to attract attention from the most casual observer. We are exceptionally favoured in having good places to grow it, as in our hardy fernery or wild garden we have several tiny watercourses, and along the sides of these the Spiræas revel, some thirty or more of *S. palmata* being exceptionally fine, and showing off in fine and pleasing contrast with the one above-named as well as paler coloured seedlings we have raised from it and its white form *S. palmata alba*, and the dear old Meadow Sweet, *S. aruncus* or the Goat's Beard is now over, but it is a grand species, with its big creamy-white towering plumes and abundant healthy foliage, and just the plant for the wild garden as it is stately and robust, if it can get plenty of moisture. *S. japonica* is too well known to need more than a passing notice, but it too, is valuable in a sheltered position and placed like those indicated, as when so favoured, it seldom gets cut or injured by spring frosts, which when exposed, often damage it greatly and cripple the leaves. *S. filipendula flore-pleno* is an old favorite, generally to be met with in herbaceous borders. The habit is lowly, the foliage being much divided, and almost prostrate on the ground, and the flowers, which are pure white, borne in paniculate heads on foot-stalks; but they are not very lasting when cut, the most durable in water being *S. japonica*, which remains quite fresh a long time. All the Spiræas mentioned admit of ready increase by division, as during the season each plant forms several crowns, and these may be separated, the best season for doing so being just as the plants are starting into growth, when they may be cut through with safety and replanted again, as then the roots are becoming active, and quickly get fresh hold of the ground. *J. Sheppard, Woolverstone Park.*

DEW, AND ITS ACTION UPON PLANTS.—*A priori* objections are always of little, and generally of no value; because they only express the writer's

opinion, without its having been put to the test of verification by experiment. If "T. H." would carry out experiments as I have described them in my paper, he will at once see that his criticism is unfounded. He would find that "it was (not) very probable that the moisture was absorbed by the stalk of the leaf," and that cuticle is by no means always so impervious to moisture as he seems to imagine. *George Henslow.*

SCOTLAND.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

AUGUST 18, 19, 20.—The annual floral *fête* of this Society was held in the Central Park, Aberdeen. Hitherto, the show of this Society has been confined to a horticultural display, the discoursing of music by a military band of distinction, and an exhibition of fireworks in the evening. On this occasion, in addition to the attractions mentioned, the programme included a military tournament! Unfortunately, the weather on the opening day was far from propitious; and the gates were closed early in the evening owing to the heavy downpour of rain. On Friday and Saturday, the weather was as fine as could be wished. The number of entries for the various sections was slightly smaller than was the case last year, and were as follows:—Pot plants, 257; cut flowers, 386; fruit, 390; and vegetables, 421—in all, 1454. The number of competitors was 140, as against 111 last year, and the smaller number of entries is accounted for by the fact that members were allowed to compete once only in each class, the idea being to divide the prizes as much as possible.

Pot Plants.—In the professional gardeners' section the display of plants in pots was very good. In the collection of best-grown plants, arranged on a table 15 feet by 8 feet, that forwarded by Mr. Alex. Grigor, gr. to Mr. A. O. Gill, of Fairfield, was awarded the 1st place. The collection contained several good Orchids, Crotons, and Pines. Besides securing the premier prize, the collection got, in addition, Her Majesty the Queen's special prize—a magnificent salad-bowl, valued at 12 guineas; 2nd honours in this competition fell to Mr. James Strachan, gr. to Mr. John Fyfe, of Beechgrove, who also exhibited a meritorious collection.

Mr. G. McHardy, gr. to Dean of Guild Macdonald, was 1st for six stove or greenhouse plants, Alexander Grigor, for Mr. Gill, being a good 2nd.

Ferns were an excellent display, more especially the exotics, and in this class Mr. Gill led.

Of Fuchsias there was but a fair show, but the assortment of Pelargoniums tabled was of a high order, the double and single zonales, and the tricolor section, being particularly noticeable.

For size and colour the show of Begonias would be hard to be beaten. Mr. John Hay, Polmuir Road, Aberdeen, carried off 1st honours with a grand specimen.

Coxcombs were well coloured, of good substance, and very dwarf. James Eddies, gr. to Miss Leith of Freefield, took 1st place. Orchids and Petunias looked really well.

In the amateurs' department the show of plants in pots was an extremely creditable one.

Cut Flowers.—Considering the backward nature of the season, the show of cut flowers was a splendid one. The show of Roses was one of the best ever seen in Aberdeen. Mr. D. Macdonald, from Deemount Nursery, was 1st for the best twenty-four blooms. The premier honours for best twelve Rose blooms went to Mr. Reid, gr. to Mr. Baird of Urie. Phloxes and Stocks have seldom been seen in better condition, and competition in these classes was keen. Pansies were numerous and good, but Dahlias were a poor show, owing to the lateness of the season. There were few competitors for the best arranged basket of flowers, but those who did enter showed a considerable amount of skill. The 1st went to Mr. William Pope, Aberdeen. The nurserymen and florists tabled a large and fine assortment of cut flowers. The Messrs. Croll, Dundee, with a

splendid collection, secured premier honours for the best thirty-six Rose blooms. The same firm were also winners in the Tea-Rose competition, with magnificent specimens. The unfortunate rupture between the acting directors of the Society and the Messrs. Cocker, Aberdeen, the well-known rosarians, precluded that firm from competing.

Fruit.—Perhaps the great feature in the *fête* was the magnificent display of fruit. The judges gave it as their opinion that never before had they seen a better. The number of entries exceeded those of last year, and the competition was close. In the professional section, Mr. A. Howie, gr. to Rev. J. S. Gemmel, of Drumtochty Castle, was placed 1st for his collection of fruit—nine dishes, distinct varieties. Mr. Howie also carried off the Silver Medal presented by the *Gardeners' Magazine* for the best collection of fruit. Grapes were in abundance, Mr. Reid, Durris, securing the principal prizes, although the other competitors ran him close. Melons, Tomatos, Peaches, and Pears were good. Strawberries, Gooseberries, and black Currants were shown in great numbers.

Vegetables.—The vegetables looked well. For the best collection, arranged in a box 4 feet by 3 feet, outside measurement, and comprising ten distinct varieties, there were six competitors, Mr. Middleton, gr. to Sir Arthur Grant, Bart., of Monymusk, taking the lead with an excellent collection; Mr. G. Milne, gr. to Lady Gordon Cathcart, took the 2nd place. For a similar collection, open to market gardeners only, Mr. W. Anderson, Lower Cornhill, received the chief prize.

Mr. W. Johnston, Hatton of Fintray, and Mr. W. D. Kirton, Ellon, were the 1st prize takers in the amateur and working sections respectively for the best collection of vegetables. The Potatos shown were very good for the season. Tubers were particularly clean and well shaped.

Plants, &c., for exhibition only.—Mr. Joseph Dalgarno, Whitehall, Aberdeen, showed a lovely collection of herbaceous plants and ferns. Messrs. W. Smith & Son, Aberdeen, and Messrs. Ben. Reid & Co., Aberdeen, exhibited magnificent collections of plants and cut flowers. Mr. John Forbes, Buccleuch Nurseries, Hawick, also exhibited largely, and was awarded a Silver Medal for his collection of cut flowers, and a First-class Certificate for his Carnation Meteor.

The opening ceremony was performed by Sir Arthur Grant, Bart., of Monymusk, who also supervised the military tournament.

SOCIETIES.

ROYAL HORTICULTURAL AT CHISWICK.

THE Conference on Begonias, Apricots, and Plums, was opened on Tuesday, the 23rd inst., in the grounds of the Society at Chiswick, in beautiful weather. The general features dealt with at the Conference are summarised in our leading article, and the details of the exhibition will be found below.

Floral Committee.

Present: J. Marshall (chairman), Messrs. Chas. T. Druery, Harry Turner, Geo. Paul, W. C. Leach, R. Dean, John Laing, B. Wynne, Geo. Phippen, II. Herbst, T. Baines, Robt. Owen, H. B. May.

Some very bright and interesting collections of cut flowers, together with good groups of Begonias, excellent exhibits of hardy Ferns in great variety, and several collections of plants, including some very fine specimens of the scented species of Pelargonium, produced a most brilliant and interesting display in the two large tents that had been erected in the grounds for their accommodation.

From the Royal Gardens, Kew, came a large group of fibrous-rooted Begonias, including some seventy species or more, which contained many species that are not often met with, and which were especially interesting in view of the Conference that was held in the afternoon. Conspicuous amongst these were some large plants of *B. Haageana* in full bloom, *B. argentea guttata*, *B. sanguinea*, *B. Scharfiana*, *B. hirsuta*, *B. Knowsleyana*, &c.

In addition to the Begonia were *Crococoma aurea* var. *imperialis*, and *C. aurea* var. *maculata*; this latter, with its large round flowers, never failing to command admiration. Also *Stenoglossa fimbriata*, and *S. longifolia*, its larger-growing relative; *Acidantha bicolor*, a very admirable plant, of very similar habit to the *Colvillei* *Gladiolus*, and bearing large creamy-white flowers, with a pretty chocolate star; and cut blooms of the new Chinese *Lilium Henryii*.

Messrs. J. Veitch & Sons, Chelsea, also exhibited some choice and rare species and varieties of Begonias, including *B. metallica*, *C. Sambo*, *B. hydrocotylifolia*, *B. Bavaria*, *Arthur Malet*, and *Marie Louise*, the prettiest plant of the Rex type we have seen, to which an Award of Merit was accorded, also *B. corallina*, *B. fuchsioides*, *B. xanthina*, beside some plants of what is supposed to be a new species, from Penang. This is very pretty, and has very dark brown velvety leaves, with veins of light green. Another interesting plant is the result of a cross between *B. Rex* and *B. socotrana* (Silver Flora Medal).

The species of Begonia shown by James Veitch & Sons were:—

Rex	Thwaitesii
xanthina	gogoensis
Evansiana	sp. from Penang
hydrocotylifolia	geranioides
manicata	Dregei
Wightii	Sutherlandii
metallica	Froebelii
socotrana	Haageana
fuchsioides	Scharthii
nitida	corallina
suaveolens	Martiana
argyro-stigma	Burkei
insignis	Beddomei
semperflorens	rubella
sanguinea	parvifolia

Messrs. John Laing & Son, Forest Hill, had an excellent group of the Tuberous-rooted section, all of them double. Awards of Merit were granted to Lord Escher, a good scarlet; to Lady Gertrude, a very delicate-looking flower, being a beautiful pink, falling to white in the centre; to Earl Cranbrook, a good rich scarlet, the foliage being wonderfully dark, and to Picotee, and Duke of Eife. The same firm exhibited a group of foliage Begonias, amongst which was a very fine variety called *Bertha McGregor*, of the Rex type, and having very ornamental and deeply-cut foliage; also *Silver Cloud*, *B. Haageana*, and *B. manicata aurea*. Mr. Laing had also three plants in three colours (white, scarlet, and yellow), of the tuberous section, but which had variegated foliage, thus blending in one plant the advantages of the showy blossoms with ornamental foliage. Sprays and a bouquet, composed exclusively of this favourite flower, were also included amongst the exhibits from Forest Hill (Silver-gilt Medal).

Messrs. H. Cannell & Sons, Swanley, Kent, had a large number of cut flowers of double tuberous-rooted varieties, very tastefully exhibited in small bunches or sprays, and containing, as usual, some fine varieties, in excellent condition. Conspicuous amongst these was the well-known pink-coloured *Lewes Castle*, Mr. Falconer, a good yellow flower; Sir J. D. Hooker, a bright red; *Madame la Baronne de St. Didier*, Mrs. O. T. Hodges, exceptionally large, salmon-pink; and a seedling of first-class merit, bright scarlet, with pretty crimped edges. Also some plants of winter-flowering Begonias, which had been obtained from cuttings this year, pinched, and were now ready to be grown along in a cool place to prepare for their duty in the winter (Silver-gilt Silver Medal).

W. Marshall, Esq., Bexley, obtained 1st prize for six foliage Begonias, showing very clean and healthy specimens of *Louis Chretien Desfontaine*, President de Hecke, *Perle de Paris*, *Brongniart*, and *Madame Alamangy*, this latter a pretty silver-coloured variety with dark centre, being awarded a First-class Certificate.

Mr. O. T. Hodges, Chislehurst, was awarded a 1st prize for nine double tuberous-rooted Begonias, which included *Albert Crausse*, Mrs. Harold, *Madame Hostein*, and *Madame Arnaut*, &c.

The Duke of Northumberland, Albury Park (gr., W. C. Leach), had some sprays of *Tilia platyphylla*. This was described as one of the finest of trees, of freer growth than the common Lime, and of exceptional merit as an avenue tree or as a single specimen on lawns (First-class Certificate).

Mr. G. Reynolds, gr. to Lord Rothschild, Gunnersbury Park, exhibited a seedling *Carnation*, a pink variety, clove-scented, and of good habit, and named Mrs. Leopold de Rothschild (Award of Merit).

Miss Debenham, St. Peter's, St. Albans, had a

collection of *Chrysanthemum* blooms; and J. Currie, Esq., Trinity College, Edinburgh, had also some blooms of *Chrysanthemums* of very good merit, including *Stanstead White*, *B. Molyneux*, Mrs. Irwin Clarke, and *Madame Desgranges* (Bronze Banksian Medal).

Messrs. J. Cheal & Sons, Crawley, had a new Pompon Dahlia, named *Crawley Bedder*.

Mr. Hudson, gr. to Lord Rothschild, Gunnersbury House, Acton, showed specimen plants of scented varieties of *Pelargoniums*, including *P. denticulata*, *P. d. majus*, *Rollison's Unique*, *capitatum*, *Little Gem*, *radula*, and *radula major*, *filicifolium odoratum*, *Lady Plymouth*, &c. These plants were all well grown, and some of them 4 to 5 feet high. Such specimens are rarely or never seen nowadays, and throughout the exhibition they created much interest (Silver Flora Medal). From the same exhibitor came a very handsome plant of *Asparagus deflexus*, in a suspended basket, and hanging some 3 to 4 feet (First-class Certificate).

Messrs. Kelway & Son, Langport, Somerset, had a large collection of cut spikes of *Gladiolus* in about fifty varieties. All of these were of high merit, but we may mention *Private Secretary*, a rosy-carmine flower, with white or cream-coloured lower

petals; Mrs. Hobhouse, fleshy-carmine, with violet blotch on the lower petals, extra large; and Mrs. McAlister, a creamy yellow variety, all of which were given Awards of Merit. The same firm had a very choice and pleasing collection of hardy flowers, including *Yucca filamentosa*, the graceful *Gypsophila paniculata*, *Echinops Retro*, *Statice incana*, *Phygelius capensis*, *Eryngium planum*, and *E. azureum*, &c. (Silver Gilt Banksian Medal).

Messrs. Cannell & Son had cut blooms of *Cactus Dahlias* in immense variety, which created a most brilliant effect. Amongst others were *Mino Hoste*, a large double, very dark crimson; *Cannell's Favourite*, a very charming variety; *Black Prince*, a good bloom, and nearly black; *Maid of Kent*, scarlet, with each petal tipped with white; *Pride of Swanley*, pink; and the old and much-prized *Juarezi*.

Messrs. Sutton & Sons, Reading, an Award of Merit for *Begonia Princess Beatrice*.

Mr. J. A. Morris, Acton, Middlesex, an Award of Merit for *Colens Distinction*, very deep velvet, the darkest we remember seeing.

From the Duke of Northumberland came a group of *Antirrhinums*, and *Pentstemons* in variety, and of much merit.

Certificates were also awarded to Mr. Chas. T. Drury, for *Athyrium filix-femina superbum per cristatum*, and for *A. f. rotunda cristatum*.

From the Botanic Gardens, Cambridge, were sent sprays of *Begonia Evansiana*, *B. Haageana*, *B. gogoensis*, *B. metallica*, and *B. parviflora*.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair, J. O'Brien, Sec., E. Hill, J. Douglas, and Dr. M. T. Masters, F.R.S.

As usual, when the meeting is held at Chiswick, the exhibits were very few in number. From Baron Schroder's gardens, The Dell, Egham, gr., Mr. H. Ballantine, came a *Cattleya*, a hybrid between *C. Trianae* and *C. dolosa*, and named *Cattleya* × *Baroness Schroderae*. Its flowers called to mind those of *C. Schroderae*, but they were of thicker substance—the sepals and petals veined and tinged with clear rose-pink; the lip white with rose-coloured edging, and the throat of rich orange (First-Class Certificate); *Drewett O. Drewett, Esq.*, Riding Mill-on-Tyne (gr. Mr. A. J. Keeling), sent spike and leaf of a light form of *Cypripedium* × *De Witt Smith* (*Spicerianum* × *Lowii*).

Messrs. Pitcher & Manda, The United States Nurseries, Swanley, Kent, exhibited *Cypripedium magoiflorum* and *C. Wallertii pallidum* (*Harrisianum* × *villosum*).

C. Whitefield King, Esq., Morpeth House, Ipswich, showed a curious *Eulophia* from Madagascar; and Messrs. F. Sander & Co., St. Albans, again sent their fine *Calanthe Sanderiana*.

Floral Committee Awards.

First-class Certificates.

- To *Nephrolepis davallioides multiceps*, from H. B. May.
- To *Pteris tremula variegata*, from Mr. H. B. May.
- To *Pteris Reginae*, from Mr. H. B. May.
- To *Pteris cristata*, from Mr. H. B. May.

MEDALS.

Silver-gilt Flora.

- To Messrs. H. Cannell & Sons, for Begonias, Cactus Dahlias, &c.

Silver Flora.

- To Messrs. Jas. Veitch & Sons, for Begonias.
- To Messrs. de Rothschild, for scented Pelargoniums.
- To Messrs. Paul & Son, for cut Phloxes and Roses.
- To Mr. Thos. S. Ware, for Phloxes & Hollyhocks.

Silver-Gilt Banksian.

- To Messrs. Kelway & Sons, for Gladioli.
- To Mr. H. May, for Ferns.

Bronze Banksian.

- To Messrs. Pitcher & Manda, for hardy cut flowers.
- To J. Currie, Esq., for Chrysanthemums.

Award of Merit.

- To *Adiantum elegantissimum*, from Mr. H. B. May.
- To *Athyrium setigerum*, from Messrs. J. & W. Birkenhead.
- To *Begonia multiflora L'Avenir*, from M. Vilmorin.
- To *Begonia Louise Robert*, from M. Vilmorin.
- To *Begonia Madame Louise Urban*, from M. Vilmorin.
- To *Begonia rosea multiflora*, from M. Vilmorin.
- To Messrs. J. Laing & Sons, for Begonias.
- To Mr. W. J. Birkenhead, for Ferns.

Fruit Committee.

Present: Mr. Philip Crowley (chairman); Messrs. W. Balderson, F. J. Lane, J. Smith, T. J. Saltmarsh, W. Warren, J. Wright, A. Dean, G. Reynolds, J. Hudson, J. Willard, W. Bates, G. H. Sage, G. W. Cummins, A. H. Pearson, J. Cheal, and G. Bunyard.

The exhibits were not, perhaps, so numerous as had been anticipated, but there were some good examples of Plums, Apricots, Apples, &c. Messrs. G. Bunyard & Co., Maidstone, showed the new *Lady Sudeley* Apple from trees in the open, and judging from this exhibit, the new variety will be the best early Apple we have. It is a

FIG. 14.—BEGONIA VEITCHII: FLOWERS OF A BRIGHT RED. (SEE P. 244.)

very pretty fruit, something like Irish Peach, but is described as being very superior to that variety, and has a much longer season (Cultural Commendation).

From the Royal Horticultural Society's own garden were exhibited Apples, Worcester Pearmain, Cellini Pippin, The Queen, Ribston Pippin, Ecklinville, Yorkshire Beauty, and Lady Sudeley. All of these had been grown in pots, and the fruits were fine and well-coloured. Pear Beacon, and Fig Large Black Douro, a good free-fruited variety (First-class Certificate), and two varieties of white Grapes Orez, Tardovany, and Voluvna (Cultural Commendation).

Mr. Geo. Lee, of Clivedon, a dish of Apples Dr. Hogg. W. Roupell, Esq., Roupell Park, S.W., showed Grapes Primavis (white), of excellent flavour; Frontignan, Purple Constantia, Gros Colmar, and Diamant Traube, a large juicy white variety. Also a dish of Lady Sudeley Apple, the result of double grafting, by which it is said a season, or perhaps two, may be saved in dealing with this variety (Vote of Thanks).

Mr. Jno. King sent a fruiting branch of Plum, to show what a heavy crop some trees were bearing in a position sheltered from the north and east (Vote of Thanks). Mr. W. C. Leach, Albury Park, Guildford, a fruiting branch of Damson, Bramley's King (Vote of Thanks).

Messrs. H. Lane & Son, Berkhamstead, showed a large collection of Plums on branches, all carrying good crops. Amongst others were Sultan, Prince of Wales, Belle de Louvain, Victoria, Cox's Emperor, Orleans, Diamond, Angelina Burdett, Jefferson, Curlew, Reine Claude de Count Hathem, Belgian Purple, and Pershore (Silver Banksian Medal).

Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, obtained 1st prize for three dishes of Apricots, with fine well-coloured fruits of Moor Park, Kaisha, and Hemskirk. Mr. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, was 2nd, with Large Early, Shipleys, and Moor Park. Mr. Wythes also sent some 150 fruits of Apricots, of the varieties Hemskirk, Shipley, and Moor Park.

Mr. Jno. Watkin, Pomona Farm Nurseries, Withington, near Hereford, sent fruiting branches of Plum Pershore, and of White Bullace, Frogmore Prolific, and Damascene of Worcester Damson. Also a collection of Damsons, in eight varieties, and of Plums, in many varieties (Vote of Thanks).

Messrs. Collins Bros. and Gabriel, 39, Waterloo Road, Nurseries, Hampton, Middlesex, obtained a First-class Certificate for a dish of Tomatos, Colling's Challenger, perfectly smooth, and of extra colour. Mr. J. Gibson showed an excellent lot of Onions, a new variety called Sutton's A1, and received a Cultural Commendation. The same exhibitor sent some Parsnips, Sutton's Student.

BRITISH FERNS.

The exhibition of British Ferns held at Chiswick on the 23rd and 24th inst. was a distinct success, the weather on the opening day, though sultry, conducing to a numerous attendance of visitors, who were certainly well repaid by the great range of the exhibits, their varietal quality, and the perfection of culture which they almost invariably exemplified. As usual, Mr. E. J. Lowe took the lead by showing some hundreds of splendidly-grown specimens of all the larger species, supplemented by a numerous batch of those singular products of crossing and hybridisation of which he has made a speciality. These together occupied the whole side of the large tent, extending also round the end of it and partly back again. This ample space was utilised wisely to display the plants, with plenty of room between for the beauties or peculiarities (not always synonymous) to be well displayed.

Beginning with this collection, the first batch of plants consisted of sixteen dwarf or congested varieties, of which the most noteworthy was an immense (for its class) specimen of a Hart's-tongue, in which the usual strap-like fronds were transmuted into one huge ball of finely comminuted moss (*S. v. densum*), a very striking plant, as it is usually represented by a specimen in a thumb-pot. *S. v. nympha* was a charming ramo-cristate form in this section.

Ten plumose forms of Shield and Lady Ferns next competed successfully for Colonel A. M. Jones' memorial prize, several of the Shield Ferns, and especially *P. ang. plum. inacc-ssum*, being really marvellous in their delicacy of cutting and amplitude of foliage. Ten cruciate forms, more curious but less beautiful, followed, the most striking of which were the hybrids which Mr. Lowe has effected between the two species, *P. aculeatum* and *P.*

angulare, some of which figured further on as hybrids in a special class of their own. *P. aculeatum*, though far less sportive than *P. angulare*, afforded material for a fine selection, *P. acul. Abbotta* and *pendens* ranking foremost. A number of really grand Hart's-tongues were next displayed, many of them crispums of great beauty, one especially, having the finely-frilled fronds of a delicate cream colour, edged with green, attracting universal attention.

An immense plant of *L. f.-m. grandiceps*, forming a solid ball of foliage some 3 feet or more through, ranked, and justly so, as the best specimen *Lastrea*. Among the small peculiar crosses already alluded to were a number of Hart's-tongues, displaying multiple parentage in a very marked way, the conjoined characters of several forms appearing unmistakably, though the question of "How it is done" still remains a moot point with scientific botanists. Mr. Lowe, who staged his collection as shown by the Clifton Zoological Gardens, though we understand it represented a combination of his own private collection, and that of the late Colonel Jones, which is under his care at Clifton, specified a very large number of new forms for Certificates, the awards for which will appear elsewhere.

The next amateur collection of importance was that of Mr. C. T. Druery, who staged a large group to the right of the entrance. Among these the most prominent were several specimens of plumose *Athyria* of great beauty, one *A. f.-f. plumosum Drueryi* carrying off the honour of "best variety in the show." These plumose varieties conjoined with two specimens of the joint productions of Col. Jones and Mr. Fox, the wonderful "densum" and "laxum" *Polystichums*, a frilled Hart's-tongue, 5½ inches across the fronds (*S. v. crispum grande*, Wills), a grand specimen of the British Tree Fern (*Lastrea f.-mas cristata*), and one of the original Victoria Lady Fern, with fronds nearly 4 feet long, secured 2nd prize for the sixteen best varieties, Mr. Lowe obtaining 1st.

Several new varieties were Certificated, amongst them a new pericostate plumose *Athyrium* of great beauty.

Mr. W. Marshall entered the lists with a collection of *Polypodium vulgare*, one of which, *P. v. trichomanoides*, ranked deservedly as the best specimen plant exhibited, and several others of his showing ran it very close. It is to be hoped that at next competition Mr. Marshall will extend his scope to other species as well. Mr. Roupell staged a group of *P. angulare proliferum*.

Messrs. W. & J. Birkenhead and Mr. H. B. May displayed two very good collections of the choicer British Ferns with fine effect. Messrs. Birkenhead's collection of *Blechnum* spicant varieties was especially good; and some fimbriate and frilled *Scolopendriums* opened out new vistas of beauty in this protean species.

To sum up, the exhibition as a whole demonstrated clearly, by several new "breaks" in various species, that our British Ferns in course of time will stand not merely as equals, but as *facile principes* among the Ferns of the world. The cultivated eye appreciates this in viewing the recently-introduced plumose *Polystichums* of Jones and Fox, the superb strain of *Athyria* of Druery, the fimbriate, crested and frilled *Scolopendriums* of Stansfield, Birkenhead, and Cropper, and last, but by no means least, the fimbriate crested *Lastrea* (*L. f.-m. fimbriata cristata*), also raised by the last-named grower. These exemplify greater advances in the right direction than anything produced within the preceding thirty years.

SCOTTISH ARBORICULTURAL ASSOCIATION.

(Continued from p. 220.)

AUGUST 10.—The "Jolly Foresters" were soon rapidly on their way to Falkland Palace, which is a place of great interest to antiquarians, the Marquis of Bute giving liberty to visitors to inspect the old building. Mr. Dewar, gardener to Lord Bute, explained much of what had been discovered by excavations made to the original foundations. Two Sycamores, closely associated with the name of Queen Mary, were measured, and were 10 feet 6 inches and 10 feet 4 inches in girth respectively. The vegetable garden, by the old palace, is closely cropped, and a portion is ornamental. Among flowering plants were lines of Pansies, yellow, blue, and white, in perfect condition with bloom, and the finest display of them I have seen for some years. The whole party was entertained at a substantial tea

by Lord Bute and Major Wood, the land agent. Nuthill was visited, where the residence of Lord Bute is located, and at the north side of Falkland Hill, which stands in the midst of grounds of unrivalled beauty. Thirteen acres are covered with fine shrubs and a choice selection of trees, around which are closely-shaven lawns, a flower garden gay with flowering plants, among a wealth of arboreal treasures are at present among the numerous attractive objects at Falkland. The plantations all along, and nearly to the summit of East Lomond Hill, created much admiration. The glades of grass through massive woods are seen at a great distance. Numerous specimens of *Araucaria*, *Cedrus atlantica*, and *C. Deodara* were inspected, and some measured. *Sequoia sempervirens* is about 70 feet in height, with a girth of trunk of 9 feet. This fine specimen is too much enclosed by other trees. *Cedrus Deodara*, purple Beeches and Birches make a fine picture at this end of the grounds, beautifully kept under the charge of Mr. Dewar. Hollies, Yews, and *Abies nobilis* thrive admirably here.

The party then drove off, passing the comely and cosy seats of Pitfour and Wellfield, and a delightful drive along the Pass of Glenfarg was enjoyed, till the "fair city" of Perth was reached as darkness was enveloping it. About 10 P.M. the company sat down to dinner at the "Salutation" hotel, Mr. John Methven presiding (in the absence of Prof. Bayley Balfour), supported by Messrs. Dunn, Laird, Watt, and other leading arborists. The toast of the evening, "The Royal Scottish Arboricultural Society," was pledged with great enthusiasm.

The morning of Thursday was wet and cloudy, but some of the excursionists started soon after 6 A.M. on a visit to the beautiful suburban residence of Robert Pullar, Tayside, to inspect his fine conservatory and other glass structures nestling so beautifully by the side of the river from which the place takes its name.

After breakfast the party started, under favourable auspices, for Scone Palace (the magnificent seat of Earl Mansfield), and to the famous grounds of Murthly Castle. During the day the party was increased by an accession of numbers from the British Association. The weather was dry, mild, and balmy, with, however, but little sunshine. The excursionists moved off about 9 o'clock. Each had his hat or coat decorated with the badge of the Association—a sprig of Scots Fir. When the party arrived at Scone (now about 112 strong), Viscount Stormouth received them, and kindly acted as guide through the fine park, rich in arboreal treasures. Beeches, Larches, Sycamores, Oaks (more remarkable for handsome stems than bulk) are abundant, and dotted through the spacious park in a manner showing their fine proportions. The beautifully-kept pinetum, with its green carpet of closely-shaven grass, excited great enthusiasm. The arboreal treasures from Japan, India, and America attracted much notice by their freshness and vigour. Wellingtonias, 70 to 80 feet high; *Picea Menziesii*; *Araucaria imbricata*, *Abies nobilis*, *Cupressus Nutkaensis*, 46 feet high; *Abies Nordmanniana*, 75 feet; *A. Albertiana*, 75 feet high; and many others in this unique pinetum were much admired. The gardens and glass structures were made for, by some of us. Forced fruits (Grapes and Peaches especially) were in admirable condition both as regards crop and general appearance.

Two splendid Fig trees bearing fine fruit were noted, clothed with foliage nearly to the ground. The flower borders were very gay, and capitally arranged; and an attractive arrangement of dwarf *Retinosporas*, dotted among flowering plants, was much admired. In the spacious and well-arranged vegetable garden, fine crops are within the walls of the usual class of vegetables required by the proprietor of such a house as Scone Palace. Rich in historical associations as Scone is, we must pass them over at present. By the palace is an *Abies Douglasii* 90 feet high; and the two trees planted near the palace by James VI. and Mary Queen of Scots, are Sycamores. The James VI. one, measured 5 feet up, is 12 feet 9 inches in girth; while Queen Mary's tree is 13 feet 4 inches, the smaller size being the healthier tree. At about 20 feet from the ground, fungi have attacked the Queen's tree. At the back of the palace was a grand Ontario Poplar, over 100 feet in height, with a girth of 15 feet 6 inches. After a long walk the Muir-ward plantations were reached, and for those much interested in commercial forestry, interesting plantations may be seen, where Larch, Scots, and Douglas Firs are planted in large breadths, to show their comparative merits as timber. The late Mr. McCorquodale planted the Douglas Fir largely

on the estates, and time has shown that he did not do this work in vain.

Lord Stormouth was thanked for his courtesy, and the party drove off through a finely-wooded country, *via* Taimount, each one delighted with the beauties and grandeur of Scone, where Mr. McKinnon has shown his skill in maanaging the extensive gardens and grounds under his charge.

A halt was made at Meiklour, the beautiful seat of Lady Lansdowne, where an inspection was made of the famous Beech hedge, which runs by the public road for a distance of 650 yards; the height is from 85 to 86 feet high, and it is cut every three years. By invitation of the Dowager Marchioness of Lansdowne, the excursionists visited the fine park and grounds, widely-known for their peculiar beauty, and were kindly conducted by Mr. Mathieson to a grand avenue of Sycamores and Beeches, which met at top, forming an arch 75 feet high; and some fine Silver Firs are here, one over 100 feet in height. Many other trees were inspected; *Abies nobilis* in groups are conspicuous. Among some fine Sweet Chestnuts, one is over 14 feet in girth. A Weymouth Pine is over 100 feet in height, and divided into eleven trunks at the base. This seat, which is swept by the Tay, and surrounded by much that is beautiful, had to be hurriedly left.

The journey was pursued to Murthly Castle, the seat of W. Stewart Potheringham, Esq., who with his factor and head gardener gave the party a cordial reception, conducting them to a spacious tent and a substantial luncheon, to which about 200 sat down. Professor Bayley Balfour proposed the health of their host, and spoke of the beauties and grandeur of Murthly. Mr. Stephen Bourne (on behalf of the British Association) endorsed the remark of the professor. The grounds traversed by the proprietor of Murthly, who has a good knowledge of his trees, was of a delightful character; long avenues finely kept by mowing machine are belted with innumerable grand specimens of the finest species of Coniferae, which could be collected. No one (except those who have previously visited Murthly) had the remotest idea of such a grand collection being in existence. I submit a list of a few of the finest specimens, which I obtained from the enthusiastic Mr. Laurie, the head gardener.

Wellingtonia planted in 1857, is 66 feet 6 inches high, 9 feet 3 inches girth, diameter of branch 26 feet; *Abies Menziesii*, 91 feet 9 inches high; *Pinus monticola*, 66 feet; *Araucaria*, 42 feet; *Abies Pinsapo*, 35 feet 8 inches; *Cedrus Deodara*, 51 feet 3 inches; *Abies magnifica*, 31 feet 9 inches; *Libocedrus decurrens*, 34 feet 8 inches; *Albertiana*, 70 feet 2 inches; *Douglasii*, 86 feet 6 inches; *Cupressus thyoides*, 33 feet 6 inches; *Abies grandis*, 64 feet 2 inches; *A. nobilis*, 75 feet 4 inches; *A. Nordmanniana*, 55 feet 6 inches; *Cryptomeria*, 36 feet 3 inches; Cedar, 65 feet 10 inches. There are many hundreds in approximate heights to the foregoing, and many fine deciduous specimens in the grounds. A Spanish Chestnut is 70 feet in height, and 18 feet 7 inches in girth. There are growing in different parts of the grounds, over seventy distinct species, all healthy and vigorous. The visit to this magnificent estate will long live in the memories of the visitors. The party were again served with refreshments, and a return to Perth was made, reaching the "Salutation" about half-past 8 o'clock. The annual dinner of the Society was held at 9 o'clock, Professor Balfour presiding.

The third and concluding day of the excursion was favoured with excellent weather. The company, numbering over eighty, started for Methven Castle, the delightful seat of Wm. Smythe, Esq. Many interesting and historical scenes are passed on the way—the castle of Huntingtower, the scene of that notable incident, the raid of Ruthven. The long avenue leading to Methven Castle is finely belted with gigantic Oaks, Scots Fir, Birches, Larch, Douglas Firs, and many other species of great size and in great numbers. The party was received most cordially by Colonel Smythe, the eldest son of the proprietor of Methven. An inspection was at once made of the trees in the home grounds, and a walk through the park and some of the woods followed, Mr. Whitton, the gardener, acting as guide to the objects of greatest interest. Some grand spreading Beeches were measured, their trunks being over 12 feet in girth. An Oak, 400 years old, was girthed at 5 feet above the ground, and it measured 20 feet. Some grand Sweet Chestnuts and Oaks are in front of the castle; an Ash with a remarkably handsome stem, measuring 13 feet 8 inches in girth.

Hurriedly passing among these numerous giants

of the forest, the private grounds are reached. Tall Birches, Wellingtonias, *Cedrus Deodaras* (an avenue of these is passed); *Retinosporas*, about 14 feet high, among many choice shrubs, are passed; measurement, by Kay's dendrometer, of an *Albertiana*, which is 63 feet in height; *Abies nobilis*, in fine form, and *Retinospora plumosa*, about 14 feet in height, are admired. Great reverence for these fine trees is manifest, and Colonel Smythe was much pleased to see the intense interest taken in such numbers of the fine specimens. A clump of Spanish Chestnuts was pointed out which had been raised from seed on the estate, and planted in 1832. Some Beeches were measured near the mansion, and found over 12 feet in girth 5 feet from the ground. Mr. Smythe and Mrs. Smythe received the visitors on the terrace by the old castle. The numerous party was hospitably entertained. Professor B. Balfour returned thanks to Mr. and Mrs. Smythe and family for their great kindness.

Accompanied by Colonel Smythe and Mr. F. Smythe, the party then drove to the Lyndoch woods, now in the possession of Lord Mansfield, the chief object being to inspect two famous Douglas Firs, said to be the largest in the country—one is 93 feet high, and the girth at 5 feet up is 12 feet 1 inch. One of these is the parent of all the Douglas Firs on Lord Mansfield's estate.

The drive was resumed to Major Patton's estate, the Cairnies, which was reached at 4 o'clock. Here the large company were entertained to luncheon, and afterwards had the privilege of viewing the treasures on the estate, where the new Conifers were planted with much taste, and growing very luxuriantly. *Abies Pattoniana* was named after Lord Justice Clerk Patton, by whom most of the fine collection of Conifers were planted. *Abies Albertiana*, *Menziesii*, *concolor*, *magnifica*, and others are of great size. After thanking their host and hostess at the Cairnies for their kindness, a drive to Kilour and Balgowan by the party was made, where many of the beautiful new Conifers are to be seen—some fine Cedars and Oaks are admired. After renewed hospitality the party thanked their host and hostess, Captain and Mrs. Black, then returned to Perth in time to catch their trains north and south, after one of the most profitable and enjoyable excursions the Society has held in late years.

MAIDENHEAD HORTICULTURAL.

AUGUST 11.—Outside of London, this is one of the best shows we have seen, where the competition is mainly confined to the exhibitors of the district. There was this year a slight falling off in the number of entries in the plant classes, but this was amply compensated for by the several miscellaneous trade exhibits, and by the fine productions and large number of entries in the amateurs' classes. Amongst these latter exhibitors there appears to be a keen spirit of rivalry.

Plants.—Mr. Lockie, gr. to G. Fitzgerald, Esq., Oakley Court, Windsor, was one of the most successful exhibitors of plants, taking 1st prizes for twelve fine foliage plants, these were well-grown and of useful size, consisting of *Crotons*, *Dracenas*, *Palms*, with varieties of *Asparagus* and *Acalyphas*. Mr. Lockie was first also for a specimen plant in flower, staging a tuberous *Begonia* some 1 foot through; also for six *Fuchsias* in fine health and profusely flowered. In the smaller group he was also the most successful with a bright arrangement.

Another successful exhibitor at this show was Mr. Lindsay, gr. to the Dowager Duchess of Buccleuch, Ditton Park, Slough. He staged a splendid group in the larger class, and easily won the 1st prize. From the same source came the finest Ferns, a Medal being also awarded in this class for excellence of culture; *Microlepia hirta cristata* being a noteworthy example. With a finely-grown *Gymnogramma Alstonii*, Mr. Lindsay beat Mr. Lockie for a specimen foliage plant, the latter staging a well-grown *Asparagus plumosus nanus*. Mr. Lindsay was also first for six zonal *Pelargoniums*.

The finest tuberous *Begonias* were those shown by Mr. A. Deadman, gr. to G. Higgins, Esq., Ray Park. Mr. Lockie came up close for 2nd place.

Table plants were best from Mr. E. Johnson, gr. to A. Gilliat, Esq., Stoke Green, Mr. Lindsay following. Mr. Fulford also showed well in this and the class for twelve fine foliage plants.

Cut Flowers.—For Roses, Mr. Taylor, nurseryman, Hampton, and Mr. Wicks, Upton Court, Slough, were the most successful. Dahlias (show) were finest from Mr. Walker, Thame, and Mr. W. Pond, both exhibiting in good form, considering the early period.

Zionias are generally staged in remarkably good quality at Maidenhead. The best this year came from Mr. Young.

Fruit.—The competition in the chief classes at this show is always keen, and the quality of the best, the district well sustaining its reputation against others from a distance. For a collection of six kinds, Mr. Gibson, gr. to Earl Cowley, was 1st, with fine examples; Mr. Goodman, gr. to Miss Hammersley, Bourne End, was a near 2nd, but an over-ripe Melon detracted from the collection. There were eight entries in the class for hardy fruits grown in the open air, Mr. Goodman being in this case 1st, with well-ripened fruit.

Mr. Marcham, gr. to Miss Arnott, Englefield Green, was 1st for four dishes, Grapes included, and also 1st with three bunches of Black Hamburgs, having in each instance what was apparently the Mill Hill variety, fine in berry, and well-ripened; Mr. Gibson in this latter instance being exceedingly close. For Muscats, Mr. A. Johnson was 1st; Mr. Osman following hard upon him. For any other black, Mr. Goodman was 1st with Alicante, well-coloured and ripe, as against large bunches of badly-finished Madresfield Court. For any other white, Mr. Osman was 1st with Foster's Seedling.

In the single-dish classes the best Peaches came from Mr. A. Johnson, the best Nectarines from Mr. D. Paxton, who also had the best culinary Apples; and Mr. J. Davis the best dessert Apples.

Vegetables.—In collections for Messrs. Sutton & Son's prizes the competition was very keen. Mr. Lockie was 1st with very fine produce, Mr. Johnson following him closely.

For Messrs. Webb & Son's prizes, Mr. Lockie again won with similarly good dishes, being in this case followed by Mr. A. Mackay, gr. to Rev. R. F. Spencer, Tyler's Green.

For Messrs. Carter & Son's prizes, the 1st was awarded to Mr. Goodman, and the 2nd to Mr. Young, both showing well.

Tomatos were very fine, the best coming from Mr. A. Mackay. Mr. Lockie was 1st for Cucumbers; and Mr. Lindsay had the best Celery. Potatos throughout the show were of extra good quality.

In the amateur classes, mention should be made of Mr. H. Arrowsmith, who showed exceedingly well in the classes for plants and vegetables, notably for a collection of the latter; the best fruit coming from Mr. W. Peto and Mr. Sheppard.

Miscellaneous exhibits greatly assisted, and the thanks of the Society are especially due to Messrs. Veitch & Sons, who sent a superb assortment of annuals and herbaceous cut flowers, with some remarkably fine Marigolds; to Mr. Phippen, Reading, for excellent examples of floral arrangements; to Mr. Owen, for tuberous *Begonias* of superior quality; to Mr. Such, for a miscellaneous collection of flowers; and to Mr. Williams, gr. to W. H. Grenfell, Esq., Taplow Court, for a group of well-grown decorative plants.

ST. ALBANS HORTICULTURAL.

AUGUST 11.—The weather was bright, and the various products staged were of excellent quality, with very few exceptions, and in some classes the competition was very keen.

The largest tent was devoted to the classes open to all subscribers, and here not a word of criticism can be given. The 1st prize for foliage plants fell to Mr. T. Nutting, gr. to B. Maple, M.P., Childwickbury, Harpenden; Mr. Fergusson, gr. to Mr. McIlwraith, taking 2nd; these gentlemen occupying the same position in the competition for stove and greenhouse plants.

The class for six flowering or foliage plants did not bring many competitors, and Mr. Nutting was again the 1st, and Mr. Fergusson, gr. to Mr. McIlwraith, 2nd. The group of miscellaneous plants arranged by Mr. Nutting was very light and graceful, and easily secured 1st.

A special prize was offered for a group of ornamental foliaged plants, and Mr. E. Beckett, gr. to H. H. Gibbs, Esq., Aldenham House, was 1st with a highly-coloured collection of *Crotons* and *Dracenas*, edged with *Carex*, and the groundwork of *Tradescantia zebrina*, &c.

Roses could not be expected to be so good as in June, but still there were some good ones shown. Mr. Beckett and Mr. Willsher, gr. to Mr. W. H. Bigham-Cox, were 1st and 2nd respectively, for both classes of twenty-four distinct and six Teas. Mr. Bush, an amateur of St. Albans, taking the 1st for twelve H.P.

The competition between Messrs. Beckett and

Nutting for the prize for cut stove and greenhouse flowers was keen, and were awarded as their names are mentioned.

Mr. F. J. Smith, of St. Albans, secured 1st for twelve varieties of herbaceous flowers.

The class for an unlimited number of herbaceous flowers was, perhaps, one of the most interesting exhibits of the show, fifty varieties being staged in the 1st prize—Mr. E. Beckett's.

Fruit was good. Mr. Beckett secured 1st for white Grapes, with well-finished bunches of Muscats; and Mr. Nutting 2nd. Both these gardeners staged black Grapes, Gros Maroc, Mr. Beckett's two bunches being well coloured and good shaped bunches, Mr. Nutting's bunches being larger, but not so well-shaped. The prizes were awarded in the above order.

Peaches, Nectarines, Cherries, and Melons were well shown. Vegetables were a fine display, especially Tomatos and Cucumbers, Mr. Beckett getting 1st in both classes, exhibiting his Victory Cucumber. Mr. Sconce was 2nd in the latter class, and Mr. Nutting in the former.

The collections of vegetables were very fine, and admirably staged. Mr. Beckett was 1st for both Carter's and Sutton's collections. Mr. Dormer, gr. to Mr. Roulad, Elstree, being 2nd in the latter class, and Mr. J. Timson in the former.

Cottagers' and amateurs' are now staging much better than in former years, giving more attention to the cleanliness of exhibits, and putting them up to the best advantage. The ladies tent for table decoration bouquets and buttonholes—showed great taste in the arrangement. Honorary exhibits were numerous. Mr. Cutbush, nurseryman, of Highgate and Barnet, and Mr. Spriggings, of St. Albans, sending miscellaneous groups; Messrs. Paul of Waltham, and of the Old Nurseries, Cheshunt, sending Roses and herbaceous flowers; and Mr. H. H. Gibbs contributing four very large Palms, and several smaller ones, to form a central group; and Mr. Sander sending some specimens of Orchids.

CHEADLE HORTICULTURAL.

AUGUST 12.—The twenty-fifth annual show was held on the above date, and extended to the following day. A complete success was the result, and the number of entries was the highest record of the Society, viz., 683.

The best prizes were offered for twelve stove or greenhouse plants, distinct, not fewer than five flowering, arranged within the space denoted by the Committee. The 1st prize was taken by the Earl of Zetland, with wonderfully fine specimens; whilst Mr. J. Watts and Mr. T. H. Sykes were 2nd and 3rd respectively.

For six stove or greenhouse plants, Mr. Sykes was 1st, and the Earl of Zetland 2nd.

In most of the leading plant classes, the competition lay between the Earl of Zetland, Mr. Sykes, and Mr. J. Watts.

Mr. J. Watts also secured 1st prize for a collection of fruit, six dishes, and Colonel Dixon 2nd. For three bunches of Grapes, distinct varieties, Mr. W. H. Verdin was 1st, and Mr. W. Bromley, Davenport, was 2nd. For six dishes of hardy fruits, Mr. J. Watts was also adjudged best competitor, and Mr. Grundy 2nd.

Mr. T. H. Sykes was 1st for a collection of vegetables, six varieties, and Mr. J. E. Platt 2nd.

NATIONAL CARNATION AND PICOTEE (Northern Division).

AUGUST 13.—The annual exhibition of the northern section of this society was held in the Royal Botanic Gardens, Old Trafford, Manchester, on this date. The southern grown blooms were past their best, but those in the Midland Counties were well in bloom, and took many leading prizes. The classes generally were well filled, and the competition close.

In the class for twelve Carnations, dissimilar, Mr. T. Lord, Todmorden, was 1st with a fine stand of blooms, which contained the premier Carnation in the exhibition, Admiral Curzon, a very fine brown; 2nd, Mr. R. Sydenham, Birmingham; 3rd, Mr. A. R. Brown, Birmingham.

In the class for six Carnations, dissimilar, 1st, Mr. Crossley Head, Hebden Bridge; 2nd, Mr. C. F. Thurstans, Wolverhampton; 3rd, Mr. J. Bleackley.

For twelve Picotees, dissimilar, the competition was very close, and classes were well filled, the blooms running very fair generally; 1st, Messrs. Thomson & Co., with a superb stand of Little Phil, Henry, Nellie, Campanini, Thomas William, Mrs. A. Chancellor, Dr. Huxley, Seedling, medium rose edge,

very pure in the ground colour, and a fine flower; Mrs. Sharp, John Smith, Constance Heron, Elizabeth, and Brunette. 2nd, Mr. Robert Sydenham, in whose stand was a fine bloom of Lakin's Ne plus ultra, not yet sent out, a very fine heavy red-edge flower. 3rd, Mr. T. Lord, 4th, Mr. A. R. Brown.

For six Picotees, dissimilar.—1st, Mr. Thurstans, with Zerlina, very clear and exceedingly fine, and the premier Picotee in the exhibition; Edith Dombraun, Thomas William, Mr. Rudd, Morning Star, and Nymph. 2nd, Mr. J. Edwards. 3rd, Mr. J. Bleackley.

For twelve self Carnations, not more than two flowers of a variety.—1st, Messrs. Thomson & Co., Birmingham, with fine blooms, some of them quite new, such as Mrs. Joseph Chamberlain, a lovely salmon colour, of fair form; Aurora, a rosy-carmine self; Negress, new, very dark; and other fine sorts. 2nd, Mr. A. R. Brown. 3rd, Mr. J. Edwards.

For six selfs, not more than two flowers of any one variety.—1st, Mr. A. W. Jones; 2nd, Mr. W. Kenyon.

In the class for twelve fancy varieties, Messrs. Thompson were again 1st, with a superb stand of flowers, their own seedlings, A. W. Jones especially fine; also Mrs. Robert Sydenham and some of Benary's new varieties. 2nd, Mr. A. R. Brown.

For twelve fancy varieties of Carnations or Picotees, Messrs. Thomson & Co. were 1st, with superb blooms, Mrs. Robert Sydenham, very fine indeed, and other first-class kinds. 2nd, Mr. A. R. Brown. 3rd, Mr. B. Simonite.

For six Fancies.—1st, Mr. R. Sydenham; 2nd, Mr. A. W. Jones.

In the classes for single blooms, a large number of flowers were staged, the 1st prize flowers in each class being—scarlet bizarre, Robert Houlgrave; crimson bizarre, Master Fred; pink and purple bizarre, Bruce Findlay, new; scarlet flake, Sportsman; rose flake, Seedling J. P. Sharp, raised by Mr. Simonite; purple flake, Squire Whitbourn.

Picotees.—Heavy red edge, John Smith; light red edge, Thomas William; heavy purple edge, Zerlina; light purple edge, Clara Penton; heavy rose or scarlet edge, Campanini; light rose or scarlet edge, Nellie.

Premier Carnation, Admiral Curzon, by Mr. Lord. Premier Picotee, Zerlina, by Mr. Thurstans.

Certificates were granted to Mr. B. Simonite, for R. F. Carnation, J. P. Sharp; and to Mr. Tom Lord, for P.P.E. Carnation, Bruce Findlay.

CLAY CROSS FLOWER SHOW.

AUGUST 16.—Clay Cross is famous for its intimate connection with George Stephenson, the great railway engineer, who constructed its famous tunnel, running through three parishes, and founded the extensive works which are now known far and wide. The Clay Cross Company has always taken a deep interest in the objects for which the Society was started in the midst of such a large colliery population, and the President for the present year is Mr. John P. Jackson, the managing director of the Company. The need for the operations of such a society as the Floral and Horticultural Society is always apparent in large colliery villages, and the promotion of a love of horticulture can only be attended with beneficial results. The Society has now been in existence between thirty and forty years, and year by year it appears to grow both in dimensions and popular favour. Given a fine day, the exhibition is always sure to be a huge success. The total expenditure in connection with the annual show, which took place on this date, amounted to £650. Unfortunately the weather was not by any means such as could have been desired. Nevertheless, the attendance was very large, though perhaps it did not come up to that of last year, when over 10,000 people passed through the gates.

One of the three large marquees was set apart for the groups, which always form a decidedly popular feature at the Clay Cross shows. The value of the 1st prize was £16, 2nd £14, and the 3rd £12. The 1st fell this year, as it has done several times in previous years, to Mr. J. Ward, gr. at Riddings House, Alfreton, with a group which reflected great credit upon Mr. Ward's taste and skill. It was composed chiefly of Crotous, Palms, and striped grasses.

The cut flowers made a beautiful display, and this was especially the case in the 2nd class, which was devoted to cottagers—an encouraging fact for the promoters. The Roses in the open class were a fine collection. Mr. Lamb of Nottingham showed a seedling Picotee, which he named the Duchess of Portland. The same variety was awarded a First-class Certificate at the Oxford Carnation and

Picotee Union, and another at the Birmingham Carnation Society's Show, both in the present month. Mr. J. W. Wilson, of Handsworth, showed a fine yellow-ground Carnation named Mrs. Wilson.

Fruit and vegetables were quite up to the average; indeed, better have never been shown at Clay Cross. For farm produce the season is a backward one, but the exhibits were quite as good as could be expected.

TROWBRIDGE HORTICULTURAL.

AUGUST 17.—This time-honoured Society held its forty-third exhibition on the above date, as usual in a field near the railway station; this field by reason of the munificence of a townsman, being now set apart permanently for this and other public and festive purposes. As usual, four large tents were filled with exhibits; and in the open class, Mr. G. Tucker, gr. to Major W. P. Clark, was 1st with nine stove and greenhouse plants, having very good examples indeed of *Dipladenia Brearleyana*, *Bougainvillea glabra*, *Allamanda Hendersoni*, an excellent piece of *Schnbertia grandiflora*, &c.; 2nd, Mr. H. Matthews, gr. to W. R. Brown, Esq., both of Trowbridge. Mr. Tucker also had the best six plants; and Mr. Matthews the best three. The best specimen plant was *Erica Marnockiana*, from Mr. H. Matthews; Mr. J. Hiccox, gr. to E. B. Rodway, Esq., was 2nd, with an admirable *Allamanda Hendersoni*.

Heaths were fairly good; Gloxinias highly creditable; Begonias, double and single-flowered, were very good, especially those shown by Mr. C. Richman, gr. to G. L. Palmer, Esq., Trowbridge. Some small but well-grown and flowered Orchids were shown in the class for four distinct. Zonal Pelargoniums very fine indeed; Petunias, Balsams, Cockscombs, &c., were all good features; indeed, it is rarely Petunias are seen to such advantage as at Trowbridge, where they are shown in the form of real specimen plants.

The best collection of nine ornamental foliaged plants were staged by Mr. H. Matthews. A half-dozen plants of *Coleus* were the best we have seen for many a day; the varieties were Butterfly, Mrs. C. Simpson, Beckwith's Gem, Mrs. Sheriff, Mr. C. Hart, and Lady Dacre, all very fine exhibition varieties, shown by Mr. H. Matthews. One leading feature at Trowbridge is the groups of fifteen Ferns and mosses, always well grown, but too frequently inconveniently crowded. The best collection came from Mr. G. Tucker, who had splendid examples of *Gymnogramma sulphurea*, and the silvery *argyrophylla*, to which were awarded the *Gardeners Magazine* Medal for special cultivation; *Cheilanthes formosa*, *C. elegans*, *Davallia hemiptera*, some fine *Adiantums*, &c. 2nd, Mr. H. Pocock, gr. to J. P. Haden, Esq., also with some very good specimens.

Groups of plants arranged for effect made a good feature also, but the space allotted to them is almost too small to display the abilities of the decorator. Mr. G. Pymm, gr. to Mrs. Goldsmith, Trowbridge, was a good 1st.

Fuchsias showed a falling off, probably owing to the coldness of the nights, at a critical time to the growers about Trowbridge, who produce some of the best plants seen in this country, having to finish their plants in the open air. Mr. G. Tucker had the best six. The varieties were Final, Arabella, Gustave Doit, Bountiful, Henry Brook, and Marginata. 2nd, Mr. H. Pocock, with plants only just inferior. Mr. Tucker also had the best four, staging Arabella, Charming, Doel's Favourite, and Mrs. Rundle; Mr. H. Pocock was 2nd.

In the cut flower department, Dahlias were finely shown by Messrs. Keynes, Williams & Co.; T. Hobbs, of Bristol; and F. Lindsay, of Frome; Roses by Dr. Budd and Messrs. Geo. Cooling & Son, both of Bath, the latter having Ernest Metz, Tea-scented—very fine indeed; Gladioli, German and French Asters; bunches of annuals, very good indeed; Carnations, Pansies, Hollyhocks, &c., including table decorations and wild flowers, were in excellent form. Rarely have better Roses been shown at this season of the year, and they were as numerous as they were fine.

Fruit was quite up to its usual high character. With a collection of ten varieties, Mr. G. Pymm was 1st, with excellent examples of Black Hamburgh and Foster's Seedling Grapes, Dymond and Royal George Peaches, Pine-apple and Lord Napier Nectarines, Moor Park Apricot, &c.; 2nd, Mr. J. Gray, Frome, with six dishes. Mr. W. Iggulden, The Gardens, Mareton, was 1st with Black Hamburgh and Muscat of Alexandria Grapes, Barrington Peach, Elruge Nectarine, &c.; Mr. J. Attwell, gr. to J. B. Brian, Esq., Bristol, was 2nd.

Black Hamburgh Grapes were well shown by Messrs.

Cray and Edwards, grs. to Captain Tucker, Frome; Buckland Sweetwater by Mr. Attwell; Madresfield Court by Mr. Iggulden; and Muscat of Alexandria, by Mr. A. Miller, The Gardens, Rood Ashton; and Mr. Iggulden, Melons, Apricots, Greengages, and other Plums; Cherries, Peaches, and Nectarines were all good and plentiful.

There was a great lot of dessert Apples, Beauty of Bath, Irish Peach, Astrachan, King of Pippins, Quarrenden, Juneating, &c. Among culinary varieties, were good dishes of Ecklinville Seedling, Lord Suffield, Peasgood's Nonsuch, Improved Hawthornden, and Emperor Alexander.

Messrs. George Cooling & Son, had several baskets of Beauty of Bath Apple, fine in appearance and richly-coloured.

Vegetables of fine quality, were largely shown, and the cottagers' classes were also good.

HASTINGS HORTICULTURAL.

AUGUST 17.—An exhibition of some considerable extent and merit was held by the above in the Alexandra Park, Hastings. The strong features of the show were undoubtedly flowering, stove, and greenhouse plants, exotic Ferns, Crotons, Fuchsias, and zonal Pelargoniums, among ornamental subjects, and vegetables, those of cottagers especially being of marked good quality, and of these we may specialise the Potatoes, Cabbage, Lettuce, Beans, Peas, Turnips, Carrots of the short early-rooting varieties, and Tomatoes.

Messrs. Bunyard of Maidstone contributed a useful object-lesson in the variety of the early Apples, Plums, Peaches, and Nectarines, which he showed, and one that is much required by local growers, who have little that is new to show in fruits, if one may form an opinion on this subject from what is visible in the fruiterers' shops.

We noted the fact that the bulk of the best prizes in the open and amateurs' classes fell to a few well-known "old hands," new aspirants apparently being quite absent from the competition. The following are the chief winners of prizes:—

Open classes.—For eight stove and greenhouse plants, distinct, 1st, Mr. E. C. Gilbert, Springfield Nursery, Hastings, for well-flowered, large, and fresh-looking specimens of Allamanda Wardleana, A. grandiflora, the fine dark blue coloured *Statice imbricata* Gilbertii, Erica cerinthoides coronata, the only plant that was under specimen size, but it was well-flowered; the white *Lapageria* and *Rondeletia speciosa*, a plant which looks better when it is not so stiffly trained as was this one.

In this class, Mr. J. Portnell, gr. to Sir A. Lamb, Bart., Beaufort Park, was made an equal 1st, with three excellently flowered Ericas, viz., *MacNabiana*, *Irbyana*, and *Austiniiana*, *Ixora Frazieri*, *Allamanda Hendersoniana*, a nicely-bloomed *Dipladenia amabile*, a profusely-flowered *Bougainvillea glabra*, and *Statice imbricata* Gilbertii.

Collections of stove and greenhouse plants, six in number, in or out of flower, brought a few nice lots, the 1st prize falling to Mr. Portnell for a *Bougainvillea*, *Anthurium Scherzerianum*, *Erica Irbyana*, a *Croton*, &c. Mr. A. Offer was successful in the one foliage plant competition, he showing *Croton D'Israeli*, a plant with beautifully-coloured leaves.

Some pretty plants of the older varieties of *Begonia tuberosa*, with pendulous flowers, were shown by Mr. J. Davidson, of Silverhill, Hastings, and others, the first-named exhibitor securing the 1st prize.

Tree and other exotic Ferns of large growth were rather largely shown. Mr. A. Offer, gr., Handcross Park, Crawley, taking 1st prize with, among others, a fine plant of *Davallia Mooreana*, *D. polyantha*, *Microlepia hirta*, *Marattia alata*, *Cibotium Schiedei*, &c. Mr. E. C. Gilbert was 2nd, his *Dicksonia antarctica*, *Alsophila excelsa*, and *Microlepia exaltata* being the best of his lot. Mr. A. Offer took the 1st prize for eight variegated and ornamental-leaved plants, with three finely-coloured *Crotona*, an *Alocasia macrorrhiza*, and *Kentia Belmoreana*; Mr. E. C. Gilbert being 2nd, with several species of Palms, a Tree Fern, &c.

Fuchsias were a notable feature, the well-grown and flowered examples shown ranging from 5 to 7 feet. The varieties consisted of Bountiful, Mrs. Rundle, Middle, Tieljens, Doel's Favourite, and Arabella. Mr. Portnell was 1st, and Mr. Lavender, gr. to — Tubbs, Esq., 2nd.

Mr. Alfred Gadd, gr. to P. A. Eagles, Esq., was awarded 1st prize in the class for a single flowering plant, for a grand mass of *Vallota purpurea*, measuring 4 feet in diameter.

The fruit shown in the open classes did not make much of a show as a whole, nor was there anything that called for special notice, excepting a quite small black Fig, named *Betada*, shown by Mr. Carter, gr. to Freeman Thomas, Esq., and some very fair bunches of black *Hamburgh Grapes*, shown by Mr. A. Gadd.

Amateurs and Gardeners.—For six specimens, distinct, of stove and greenhouse plants in bloom, 1st, Mr. Portnell, his plants being in some instances of the same species and varieties as those shown by him in the open class, only smaller. Mr. A. Gadd was 1st for four plants in bloom, but which he had tried to spoil with a good deal of success by stiffly training them. Mr. Offer was 1st for four specimens of ornamental foliage plants, with a very fine *Maranta Makoyana*—a species now seldom seen well-done; *Dieffenbachia magnifica*, and a beautiful *Croton undulatus*. Mr. Portnell showed Fuchsias, and obtained 1st prize, but it was evident that he had bestowed all his strength on the open class, his exhibit in this division being very weak.

A noteworthy feature was the various exhibits of cut blooms of annuals. It is one deserving of greater encouragement than it obtains at present.

A considerable amount of space was occupied with cut flowers, herbaceous perennials, Dahlias, Asters, Verbenas, Phlox Drummondii, Roses, Marigolds, Picotees, and Carnations, several trade exhibits assisting materially in this division.

Groups were shown, but the space allotted to each was too small to allow of much variety being introduced into the arrangement, or of much variety of materials. The exhibitor of the least variety was, perhaps, Mr. E. C. Gilbert, and the judges, evidently impressed by his numerous examples of *Francoa ramosa*, standing amongst a number of green and variegated plants of low stature, awarded him the 1st prize. The other groups consisted of the usual small stove and greenhouse plants in greater or less variety. Given a fire-place, a closed doorway, a corner in an apartment or a vestibule, a table or stand, or a large flat vase, or a fountain, how should these various positions or places be gracefully filled with plants in or out of flower? These are the kinds of exercises that exhibitors should have set them at a show, and not the arrangement of mere groups of one size and form.

Vegetables were largely shown and good, equally those shown by amateurs, cottagers, and market gardeners.

Table decorations of the usual character seen at flower shows were numerous and varied.

ASCOT HORTICULTURAL AND INDUSTRIAL EXHIBITION.

AUGUST 17, 18.—The annual summer show of the Sunninghill, Ascot, and Sunningdale Horticultural Society was held on Wednesday and Thursday (after a week's postponement), at the Grand Stand, kindly lent for the occasion by the Trustees. The ball-room was set apart for the industrial and fruit exhibits, Mr. Phippen, of Reading, filling one end of the spacious building with a fine collection of Lilies, Palms, *Dracænas*, Carnations, Ferns, &c., one of the chief features in the group being a magnificent wreath composed of Lilies and Ferns. Messrs. Cannell & Co., of Swanley, showed a good assortment of *Begonias*; and Mr. Pontin, of Wokingham, some Tomatoes and Cucumbers. Besides these trade exhibits, Mr. C. E. Barnett, of King's Beeches, Sunninghill, showed a fine collection of flowers and plants; and Miss Belcher, of Spring Grove, Sunningdale, had a good display of *Gloxinias*, *Begonias*, *Pandanus*, &c., all these exhibits being not for competition. Not the least interesting display made in this room was on the stalls of the Ascot and Sunninghill ironworkers—young men and boys of the neighbourhood who fill their spare time up with making a variety of articles out of strips of iron with pliers and other simple tools. Miss Barnett, of Sunninghill, and the Rev. H. Wilson, of Ascot, superintended this branch of industry. The principal articles exhibited were lamp-brackets, picture-frames, vase-stands, large and small screens, &c., in numerous designs. In the ante-room were arranged a number of the vegetable exhibits, and a collection of flowers, *Pelargoniums*, Fuchsias, *Hydrangeas*, *Heliotrope*, and Ferns. The rotunda was chiefly set apart for the groups, Mr. Magniac, of The Hermitage, Ascot, supplying a magnificent central group of Ferns, surrounded by Fuchsias, *Pelargoniums*, and other flowers. Mr. C. D. Kemp-Welch, the Hon. Ashley Ponsonby, and Mr. E. Hamilton also

showed fine groups, consisting of Lilies, foliage plants, Palms and Ferns forming the groundwork. Messrs. Standish & Co., of the Ascot Nursery, had the largest group. Sir W. Farmer, of Cowarth Park, Sunningdale, and Miss J. D. Smith, of King's Ride, Ascot, were also non-competitive exhibitors.

SHREWSBURY FLORAL FETE.

AUGUST 17, 18.—Favoured with fine weather the whole time, there was an enormous attendance of visitors, and the exhibition was a grand one.

A large tent was devoted to stove and greenhouse and other plants, and in the class for sixteen stove and greenhouse plants, not less than eight in flower, there were three exhibitors. 1st, Mr. Cypher, Cheltenham; 2nd, Mr. W. Finch, gr. to J. Marriott, Esq., Coventry; 3rd, Mr. J. Mould, Pewsey, Wilts.

For six plants, the two collections from Mr. Cypher and Mr. Marriott were so close, that equal 1sts were awarded. In the Cheltenham lot were *Bougainvillea glabra*, *Ixora Pilgrimii*, *Allamanda nobilis*, *Erica Austiniiana*, *E. Marnockiana*, and *Phenocoma prolifera Barnesii*, very fine. In Mr. Marriott's were a grand *Ixora Duffii*, with twenty-five trusses, and two fine *Ericas*. Mr. Cypher also staged plants not for competition, consisting of twenty stove and greenhouse specimens.

A great deal of interest was concentrated in the groups, and six were set up for competition; they were all arranged on one side of the large tent, and were to occupy 300 square feet. Mr. Bair, Trentham, was 1st, with a beautifully worked-out group, with a charming background of Bamboos, all artistically arranged; 2nd, Mr. Cypher; 3rd, Mr. C. H. Wright. There was a great fault in some of the groups obtaining the Town prizes, in the plants being too closely grouped together; still, taking them all round, they were a very fine lot.

The classes for Ferns and Palms were all well filled. Mr. Cypher was a strong 1st for a group of not less than twenty *Orchids*, with from fifty to sixty plants, charmingly arranged amongst Ferns and other plants, and some choice things amongst them; a grand plant of the very lovely *Sobralia xantholeuca*, of rich cream colour, was conspicuous; some plants of *Dendrobium Phalenopsis*, one almost a white, and all varying; *Vanda cœrulea*, with twelve large blooms; *Cattleya Dowiana* and *gigas*, very rich in colour; *Cypripedium grande*, very fine; *Oncidium dasytyle*, the Bee Orchid, and others. Mr. Blair set up a nice lot, in which were six or eight fine plants of *Oncidium macranthum*, and a handsome *Bilbergia* in flower, the name of which we could not ascertain. Mr. Blair's six *Dracænas* were excellent, especially a plant of *D. Lindenii*, which was very good in colour.

The zonal *Pelargoniums* generally were excellent, especially the 1st prize lots of six singles and six doubles, by Mr. Myers, florist, Shrewsbury. These were two grand lots of admirably-grown plants with superb trusses of flower.

A few good *Begonias* were staged, especially the 1st prize six from W. Beacall, Esq., Summerford. *Coleuses* were well done generally, and the classes for fifty miscellaneous plants brought out a capital lot of exhibits; 1st, Messrs. Jones & Son, Shrewsbury; 2nd, J. H. Darby, Esq., Winham.

CUT BLOOMS.

There was a great display of cut flowers, and with twenty-four *Roses*, Messrs. Harkness & Sons were 1st, and Messrs. Perkins being a good 2nd; a quantity of excellent blooms was staged throughout. Large prizes were offered for a collection of Dahlias, all kinds, in a space of 15 by 6 feet, and four lots were staged; 1st, Messrs. Keynes, Williams & Co., Salisbury; 2nd, Mr. G. Humphries, Chippenham; 3rd, Messrs. Jones & Son.

In the classes for thirty-six and twenty-four Dahlias, some fine stands were set up. For thirty-six, 1st, Messrs. Kimberley & Son; 2nd, Mr. Humphreys; 3rd, Mr. J. Walker, Thame. For twenty-four, 1st, Mr. Walker; 2nd, Messrs. Keynes & Co.; 3rd, Messrs. Kimberley & Son.

Large prizes were offered for a collection of *Gladioli*, to fill a space 24 by 6 feet, but there was only one competitor, and his blooms were not sufficiently good to warrant a 1st prize of £5 and Silver Medal being awarded to it, so that a 2nd prize only was awarded. Messrs. Kelway & Sons staged a beautiful lot, not for competition, and a few Certificates were awarded to new varieties.

In the class for hardy herbaceous cut flowers, to fill a space 16 by 6 feet, there was a large display; 1st, Mr. Cuthbertson, Rothesay; 2nd, Messrs. Dick-

sons, Limited; and 3rd, Messrs. Harkness & Sons; but in some of the collections a good number of Carnations, Pentstemons, and Antirrhinums appeared, whilst others kept to the old acknowledged herbaceous flowers. It would be a wise step on the part of committees to adopt the wording as "hardy border flowers," excluding undesirable species and varieties. At Shrewsbury a protest was lodged against the admission of Carnations, Pentstemons, and Antirrhinums, and it is best to have the groundwork of the schedule as clear as possible for both exhibitors and judges.

Some fine Carnations and Picotees, the latter especially, were staged for prizes, Mr. Robert Sydenham being 1st for both; and Messrs. Thomson & Co., Birmingham, was 1st for twelve grand fancy Picotees, in which the very fine new variety, Mrs. R. Sydenham, was conspicuous.

The competition for two bouquets, 1st prize, £5 and Silver Medal, was hotly contested, and a grand lot were staged. 1st, Messrs. Jenkinson & Son, Newcastle-under-Lyme; 2nd, Messrs. Jones & Son; 3rd, Messrs. Perkins & Sons. Six epergnes were staged. Messrs. Jones & Son 1st, with a light elegant arrangement.

A new feature here were the prizes for dinner-tables for eight persons, and there were five exhibitors. 1st, Mr. J. R. Chard, Stoke Newington, very pale blush and creamy-yellow flowers only; 2nd, Messrs. Jones & Son, with a beautiful arrangement, but the three large epergnes rather overdid it.

Fruit.—Fruit is always a great feature at Shrewsbury, and, taking the season into consideration, there was a fine display. Black Grapes in many cases were well-coloured, and, in some cases also, not ripe. White Grapes, with a few exceptions, wanted colour. Excellent prizes were offered for collections of twelve dishes, and the competition was exceedingly close betwixt the 1st and 2nd prize lots. Mr. Dawes, gr. to the Hon. Mrs. Meynell Ingram, was placed 1st; Mr. Iggulden, gr. to the Earl of Cork, 2nd; Mr. Goodacre, 3rd; and Mr. Blair 4th. In the class for nine varieties, there was keen competition. 1st, Mr. S. Brömmel, gr. to H. H. France Hayhurst, Esq.; 2nd, Mr. C. Roberts, gr. to C. H. Wright, Esq., Halston Hall; 3rd, Mr. G. Pearson, gr. to Lord Berwick.

For six bunches of black Grapes, three varieties, there were nine exhibitors, 1st, Mr. J. Bennett, gr. to the Hon. C. H. Wynn, with a grand lot; 2nd, Mr. Hepburn, The Priory; 3rd, Mr. J. Langley, gr. to the Rev. F. M. Bulkeley Owen.

For three bunches of black Hamburgs (eight exhibits) 1st, Mr. J. Bates, gr. to J. T. Harries, Esq., The Hawes, Stoke, with superb highly finished bunches; 2nd, Mr. R. Brownhill, gr. to J. C. Sinclair, Esq., Rockferry. A class for three bunches of black Grapes brought out a good competition, and Madresfield Court was freely exhibited in good character. The classes for white Grapes were also well filled, as were the classes for the Salopian growers.

Peaches, Nectarines, and other fruits were well represented in their various classes, and some of the fruit shown was very fine indeed. Mr. Blair staged twelve good Pines, and was awarded a Silver Medal.

Vegetables were in great force as usual, remarkable quality being strongly represented. The collections generally were very fine, and the single dishes or lots very closely contested. The 1st prize of £5 for a collection was won by Mr. Pope, gr. to the Earl of Carnarvon; 2nd, Mr. T. Wilkins, gr. to Lady Theodora Guest; 3rd, Mr. C. J. Waite.

In the class for collections confined to residents in Salop, Mr. T. Smeatham, gr. to Capt. Cunliffe, Leston Knowle, was 1st.

The Potatoes were very fine; and for three dishes, Mr. Coombes, The Gardens, Himley, was 1st, with a clean medium-sized lot; and Mr. J. Hathaway, gr. to the Earl of Lathom, was 1st for six dishes, with a very fine lot; Mr. Coombes was a good 2nd; Mr. H. Forden, 3rd, and with nineteen exhibits in this class. The competition was very strong in the single dish classes. Very fine Onions, Tomatoes and other vegetables were also staged in profusion.

Special prizes—These for vegetables were offered by Messrs. Sutton & Sons, Messrs. Webb & Sons, Messrs. Carter & Co., Messrs. Thomson & Co., and Mr. Sydenham, and very fine exhibits were staged, but want of space compels us to pass over many things deserving of notice.

The honorary exhibits in themselves were sufficient to form a fine exhibition. Messrs. Sutton & Sons staged a grand lot of their superb new Gloxinias, to which a special Gold Medal (the only one ever given at Shrewsbury) was awarded; and Certificates to Gloxinias Her Majesty, Duke of York,

Souvenir de Shrewsbury, Empress of India, and Purple Prince; also to some new winter-blooming Begonias. Silver Medals were awarded to the Liverpool Horticultural Company for a fine display of floral designs; to Messrs. Cutbush & Sons, for a group of plants; to Mr. B. R. Davis, Yeovil, for Begonia blooms—a fine display; to Messrs. Hewitt & Co., Birmingham, for a fine display of plants and cut flowers; to Messrs. Thomson & Co., Birmingham, for 500 blooms of Carnations and Picotees; to Messrs. Cannell & Sons, Swanley, for Begonia and other blooms.

Certificates were also awarded to Messrs. Keynes, Williams & Co., for seedling Cactus Dahlia Mars; to Messrs. Birkenhead, Sale (Silver Medal last year), for Ferns; to Mr. E. Murrell, Shrewsbury, for a fine exhibit of Roses and other blooms and plants; to Messrs. Kelway & Son, for a grand lot of Gladioli (Silver Medal last year, and these are not given two years in succession to one person); to Mr. H. Eckford, for new Sweet Peas; to Messrs. Dicksons, Limited, for plants and cut flowers; to Mr. Myers, Shrewsbury, for collection of plants; to Mr. Chas. Turner, for Picotees and Carnations; to Mr. J. H. Pattison, for Violets; and to Messrs. Thomson & Co., for new self Carnation Mrs. J. Chamberlain. A special extra prize was also awarded to Mr. Wallis, Keele Hall Gardens, for five dishes of five Figs.

Special praise and congratulations were general, and Messrs. Admitt and Naunton, the hardworking Hon. Secs., and committee, were the recipients.

The attendance on the first day numbered 15,000, and 40,000 on the second. The receipts amounted to £2063 14s., being £297 in excess of last year's takings, and that had hitherto been the highest amount.

BASINGSTOKE HORTICULTURAL.

AUGUST 18.—The above Society held its annual exhibition of plants, fruits, flowers, and vegetables at Hackwood Park. The following are the awards made by the judges in the principal classes:—

Plants.—Mr. B. Bowerman, gr. to Charles Hoar, Esq., President of the Society, Hackwood Park, had no difficulty in securing the special prize given by his employer for the best twelve plants in or out of bloom, his best plants being of the usual species and varieties. Mr. Holdaway, gr. to Colonel J. May, Hawkfield, Basingstoke, had the best six plants. Mr. Russell, gr. to W. Bradshaw, Esq., Audley's Wood, Basingstoke, had the best specimen stove plant in flower, staging a grand plant of *Eucharis amazonica*, having thirty spikes of flowers. Mr. Holdaway secured the prize given by his employer (Colonel May) for twelve stove and greenhouse plants in or out of flower.

Fuchsias, Pelargoniums, Begonias, British Ferns, and Achimenes were well shown, the Fuchsias being especially fresh and well-flowered, and about 7 feet high.

Groups.—The coveted prize for a group of miscellaneous plants arranged for effect, was awarded to Mr. Weaver, gr. to W. O. Gilchrist, Esq., Oakley Hall, Oakley, for a very charmingly-arranged group. A Palm with arching fronds occupied a central position in the background, and "dot" plants of *Tuberose*, *Aralias*, *Pancratium*, *Cocos Weddelliana*, brightly coloured *Crotons*, a variegated grass, apparently *Dactylis glomerata*, *Francoa ramosa*, *Caladium argyrites*, &c., set on a base of Maidenhair Fern, the whole being edged with Ferns, *Caladium argyrites*, &c. Mr. Bowerman was a close 2nd, the back part of his group wanted fulness and height.

Fruit was fairly well shown in sixteen classes. With a collection of eight kinds Mr. Bowerman was a good 1st, staging two kinds of Grapes, a Melon, Humboldt Nectarines, Dymond Peaches, Hemskirk Apricots, Washington Plums, brown Turkey Figs; a good all-round lot of fruit. Mr. T. Osman, gr. to L. J. Baker, Esq., Ottershaw Park, Chertsey, was 2nd, his collection including two handsome bunches of black Hamburg Grapes.

Mr. Best, gr. to Mrs. Chute, The Vyne, Basingstoke, was 1st, staging black Hamburg Grapes, Peaches, Nectarines, Figs, Apricots, and Melon.

Out of four lots of black Hamburg Grapes staged, Mr. Osman was a good 1st with shapely bunches, fine in berry and finish.

Mr. Bowerman was 1st in the any other black class, with nice bunches of Gros Maroc; and Mr. Osman was 1st in the any other white Grape class, with Foster's seedling.

Mr. Bowerman had the best Peaches out of five dishes, showing well-coloured fruits of *Violette d'Alatie*. He was also 1st for Nectarines, and 1st for three dishes of Plums, staging fine fruits of Belgian

Purple, Early Orleans, and Washington. Mr. Best had the best dish out of three lots of Apricots shown. Mr. Best had the best three dishes of culinary Apples, showing good fruits; and Mr. Kneller, gr. to Wyndham S. Portal, Esq., Malshanger, was 1st for three dishes of dessert varieties, with Beauty of Bath, Red Astrachan, and Mr. Gladstone.

Vegetables.—Special prizes for vegetables, &c., were offered by Messrs. Sutton & Sons, Reading; Webb & Sons, Stourbridge; and Jas. Carter & Co., London, bringing together much excellent produce.

Out of six lots of Tomatoes staged, Mr. H. Remnal, gr. to A. H. Jackson, Esq., West Ham, was 1st, with immense fruits of the Trophy, beautifully coloured.

Cut Flowers.—Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester, was 1st in both classes for twenty-four and twelve Roses, distinct.

Non-competitive Exhibits.—Messrs. Sutton & Sons, Reading, had a very bright, attractive, and interesting collection of cut flowers arranged to the best advantage in a prominent position in the principal exhibition tent, interesting and useful as serving to show what a fine floral display may be made by making and growing a judicious selection of annuals. In front of the above-named flowers, which were shown in good-sized bunches, on raised stands, were several fine blooms of their superb double *Petunias* of fine colour, and mostly fringed; and *Gloxinias* in 48-sized pots, a fine strain, the flowers being large, good form, and rich in colour, and thrown well above the foliage.

Mr. Phippen, also of Reading, displayed his art in the manufacture of wreaths, &c.; and Messrs. H. Cannell & Sons, of Swanley, Kent, staged some approved varieties of the Dahlia.

NATIONAL CO-OPERATIVE EXHIBITION, CRYSTAL PALACE.

AUGUST 20.—With a schedule of some 250 classes, and some 700 prizes, it was evident that any detailed report is in these columns out of the question. The show was the fifth of the series, and one of the best, for if in some classes the entries might have been fewer, at least the average quality of the exhibits was superior; still, it affords some evidence of the nature of the competition, that of two classes for Peas in one section, there were fifty single dishes in one, and thirty-five in another; then, of dwarf Beans there were thirty-six dishes, and of Runner Beans thirty-four dishes, Marrows, Onions, &c., running very nearly as liberally; then there were collections in each section for diverse districts, the entries in some being good; others, the more remote, indifferent. In any case, the length of tabling filled with products must have reached fully half a mile, and in some respects wore a rather monotonous appearance, which could have been much more effective if the various plants and cut-flower classes had been placed between each vegetable class, as in that way the variety to the spectators would have proved far more attractive. As plants had to be brought in most cases very long distances, they were not all so fresh as could be desired; but some, notably foliage plants, Ferns, and annuals, in pots, were very good. Some of the pot-annuals were beautiful. Stocks, Asters, Marigolds, Coreopsis, Mignonette, Phlox Drummondii, Balsams, *Petunias*, *Lobelias*, &c., were both very numerous and showy. Cut flowers were indeed legion; they could hardly be counted, and were there in many hundreds. Bunches of hardy annuals were in many cases good. The Mignonette in threes and the Sweet Peas in single bunches were delicious. African Marigolds were, in some cases, superb, but the French striped were poor; some, indeed, amusingly so, especially one lot of twelve blooms, stuck singly into large bottles, but that was a particular case. Dahlias, Zinnias, Asters, Stocks, Carnations—indeed, almost every variety of garden flower producible from seed, seemed to be in evidence, presenting a wonderful tribute to the love of flowers which so markedly pervades the working classes.

Fruit, too, was very good. Capital cooking and dessert Apples, Plums, Morello Cherries, Gooseberries, Currants, and Raspberries were excellent; and Tomatoes, though not recognised as fruits, were abundant and good. In the class for three distinct varieties, there were cases where it would have been impossible to find distinctness except in name; hence the folly of making a class that invites such dubious practice.

The same difficulty seems to present itself in the case of Potatoes, where four dishes were invited, for so many as three selections out of the same sort could be found in this class, but then there was no requirement of distinctness. Still, it was

very obviously intended. In the case of single dishes, if less in number than last year the average quality was higher, and some were specially good. The best white rounds were Sutton's Seedling and Satisfaction, Abundance, and Victory. The best-coloured rounds Reading Russet, Vicar of Laleham, Adirondack, and a very handsome variety having white flesh and blotched with purple, named Lord Tenyson. The best white kidneys were Interational, Chancellor, Snowdrop, and Reading Giant; but large coarse Satisfaction was largely shown as white kidney. Of coloured kidneys the best were Mr. Brease, Ruby, Edgcote Purple, Prizetaker, and Lord Raglan, a very handsome purple-blotched Lapstone. There were some 150 dishes in the four classes in one section alone. Some classes devoted to the gardeners of subscribers brought competition such as we are accustomed to see at ordinary exhibitions.

In the section for the western division, the only exhibitor of a collection of vegetables was Mr. Wright, gr. to C. Lee-Cambell, Esq., whose things were inferior. Better quality was found in the southern section, where Mr. Waite, gr. to Col. Talbot, Esq., was 1st in numerous classes; he had fine Cauliflowers, Leeka, Satisfaction Potatoes, Perfection Tomatoes, white Celery Ne plus ultra, Runner Beans, Telegraph Peas, Giant Rocca Onions, &c., in the collection, and was 1st; and in small dishes, dwarf French Beans, Dell's Beet, Cabbages unduly large, &c. Mr. J. Flutton, Oxford, who was 2nd with the collection, was 1st with "One and All" Runner Beans, really Ne plus ultra; and the same variety in another class, but named Champion scarlet. Mr. J. Martin, gr. to F. Longman, Esq., had very handsome Turnip-rooted Beet; and Mr. J. Martin, gr. to E. V. Neale, Esq., had the best scarlet Intermediate, red Intermediate (same variety), and long Surrey Carrots; all exceptionally good. One lot from Oxford in this latter class had tails 30 inches long. The best white and red Celeries it was evident had been blanched in paper, and were much cleaner than other samples. What was set up as "One and All" exhibition Marrow Pea, was chiefly Duke of Albany.

Fruit was very fair. The best kitchen Apples were Peasgood's Nonsuch, Alexander, and Lord Suffield. The best desserts were Striped Juneating, and Alexandra (Bunyard's Seedling). Mr. Waite had the best collection of six dishes of fruit; Mr. Osman, Ottershaw Park, coming 2nd. Mr. Waite had the two best bunches of black Grapes, and Mr. J. Mossman the best whites; we cannot, however, enumerate other wins.

At the far end of the nave were collections of vegetables, &c., from the Royal Arsenal Co-operative Society, and Mr. Osman, the South London District Schools, Sutton, very good samples; and also one from the Horticultural College, Swanley, which, for a horticultural institution, was not very satisfactory.

TRADE NOTICE.

We are informed by Messrs. F. Miller & Co., Seed-Bulb, and Plant Growers, 267, Fulham Road, S.W., that their tender has been accepted for the supply of all the bulbs (Hyacinths, Tulips, Crocus, Narcissus, &c.), for planting in all the London parks, squares, and gardens under the control of the London County Council.

MARKETS.

COVENT GARDEN, August 25.

MARKET quiet, with supplies good. Prices generally easier. James Webber, Wholesale Apple Market.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Arum, Asters, French, Carnations, etc.) and prices in s. d. s. d. format.

ORCHID-BLOOM in variety.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit prices: Apples, Grapes, Kent Filberts, Lemons, Melons, Peaches, Pine-apples, Plums.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing potted plant prices: Adiantum, Aspidistra, Asters, Balsams, Begonia, Campanula, Coleus, Cyperus, Dracena, Ferns, Ficus elastica, Fuchsia, Heliotrope, Hydrangea, Lilium Harrisii, Lobelia, Marguerite, Mignonette, Palms, Pelargonium.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing vegetable prices: Artichokes, Beans, Beet, Carrots, Cauliflowers, Cucumbers, Endive, Herbs, Lettuces, Mushrooms, Mustard, Parsley, Shallots, Spinach, Tomatoes, Turnips.

POTATOES.

MARKETS a little firmer. Best samples, 75s. to 85s.; medium, 55s. to 65s. Arrivals not quite so heavy. J. B. Thomas.

SEEDS.

LONDON: Aug. 24.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report an improving demand for Trifolium at advanced rates; the supply of English seed is almost exhausted. For fine white sowing Mustard, which is very scarce, high prices are obtained. New winter Tares keep firm at prices which, owing to the short crop, are higher than those of past years. Rye continues firm. New Rape seed is now coming to hand cheap and good. Canary seed, owing to the heavy exports, and the small supplies remaining, has advanced 3s. per qr., Turkish seed being sold in Liverpool at 80s. per 46 lb. Hemp seed firm. In Millet, Linseed, Dari, and Buckwheat there is no alteration. Samples of new Peas are now coming to hand which show moderate quality. Haricots unchanged.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Large table with columns for DISTRICTS, TEMPERATURE (Day-deg., Accumulated), RAINFALL (10ths Inch, Ins.), and BRIGHT SUN. Rows list districts like 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10.

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending August 20, is furnished from the Meteorological Office:—

"The weather during this period varied considerably in the different parts of the kingdom. In the N.W. and N. it was very unsettled, with a good deal of rain, until nearly the end of the week; in the more S. and S.E. districts, however, it was generally fair and dry, except on Thursday and Friday, when sharp thunderstorms, accompanied by very heavy rainfall, were experienced. By Saturday the conditions had become fine and bright on all excepting our extreme N. coasts.

"The earthquake.—During the night of the 17th—18th, distinct shocks of earthquake occurred at some of our W. and S.W. stations.

"The temperature slightly exceeded the mean over the greater part of England and in the Channel Islands, but did not materially differ from the normal over Ireland and Scotland. The highest of the maxima were registered on the 15th in most parts of Scotland, on the 17th over England, and on the 20th in Ireland; and they ranged from 83° in 'England, E.,' 81° in the Channel Islands, 80° in 'England, S.,' and 79° in the 'Midland Counties,' to 67° in 'Scotland, W.,' and 66° in 'Scotland, N.,' the lowest of the minima occurred during the early morning of the 20th, and ranged from 34° in 'Scotland, E.,' and 36° in 'Scotland, W.,' and 'England, S.W.,' to 45° in 'Ireland, S.' and to 54° in the Channel Islands. Over England the minima during the greater part of the week were rather high.

"The rainfall exceeded the mean in all the Irish and Scotch districts, but over England the fall was less equable. In 'England, E.' there was a very large, and in 'England, S.' a fairly large, excess (due to the thunderstorms of Thursday and Friday), but in the other districts there was a considerable deficit.

"The bright sunshine was more prevalent than during the preceding week in nearly all districts. In almost all parts of England, and in 'Scotland, W.' it exceeded the mean, but elsewhere it again showed a deficit."

NOTICES TO CORRESPONDENTS.

APPLE SHOOT: C. S. Johnston. The shoot shows that canker has attacked the tree. Lift the tree, drain the soil, replant in good loam only, keeping the roots within 6 inches of the surface. The cankered places on the shoots should be cleaned of all diseased tissue, cutting it away down to the quick, badly diseased shoots being removed altogether.

BOOKS: N. B. S. Greenhouse and Stove Plants, by Thomas Baines (John Murray, Albemarle Street, London) — FRUIT TREES IN POTS: Subscriber. The Miniature Fruit Garden, by Mr. F. T. Rivers, Sawbridgeworth, Herts; Fruit Culture Under Glass, by D. Thomson (Blackwood & Sons, Edinburgh and London).—R. G. Cassell's Popular Gardening. There was a reissue of this work in 1888. It was edited by Mr. T. D. Fish.

CORRECTION: AZALEA HEXE. Instead of "fresh when cut nearly a month from the plant," read "fresh for nearly a month on the plant."

CYCLAMEN: Davis. Next week.

GARDENING APPOINTMENTS: Webster. These are mostly supplied to us by the men who obtain the situations; sometimes by nurserymen who may have filled them with men on their books, and who occasionally furnish the information. In other cases, we seldom know who has recommended the gardener.

GAS LIGHT: Young Gardener. The fumes of gas are always injurious to plants in rooms, in degree according to the amount of sulphurous vapour it contains.

NAMES OF PLANTS: C. W. D. Gentiana phlogifolia.—W. B. Artemisia Ludoviciana.—J. P. Asclepias tuberosa var.—P. & Sons. 1, Campanula rapunculoides; 2, Senecio nemorensis; 3, Lysimachia vulgaris.—J. F. H. 1, a variety of the common Yew, Taxus baccata; 2, Abies amabilis (true); 3, Spiraea arifolia.—Sphinx. C-riuthe minor, common in Southern Europe.—V. K. There were two marked 4, but not one marked 2; 1, Abies cephalonica, with cone; 2, Abies Lowiana, long leaves, pale green; 3, probably Abies Webbiana; 4, Abies Nordmanniana, handsome dark green,

with separate cone; 5, *Abies Piusapo*; 6, *Cupressus torulosa*; 7, *Thuja (Biota) orientalis* var. *G. W. H.* 1, *Galega orientalis alba*; 2, *Veratrum album*; 3, *Verbascum cupreum*; 4, *Hemerocallis fulva* var. *Thynne & Paton*. *Eleagnus longipes*, figured in the *Gardeners' Chronicle*, 1873, p. 1015; The fruits are very acid, but not unwholesome.—*C. P.* *Linaria vulgaris*.—*W. S.* 1, leaf only; 2, *Sedum spurium*; 3, *Oxalis acetosella*; 4, leaf only; 5, *Melissa officinalis*, Balm; 6, *Artemisia argentea*—*Llandaff*. *Catalpa bignonioides*.—*Heythrop*. 1, *Scrophularia nodosa*; 2, *Eupatorium cannabinum*; 3, *Inula dysenterica*; 4, *Lysimachia vulgaris*; 5, *Lythrum Salicaria*; 6, *Euphrasia officinalis*; 7, *Vicia cracca*; 8, *Lotus corniculatus*; 9, *Valeriana officinalis*.—*Dockett*. *Impatiens fulva*.—*J. K.* *Abies Nordmanniana*.—*D. B.*, *Chelmsford*. A variety of *Cattleya granulosa*.—*Holeypart*. *Bignonia radicans*.—*Alex. H.* The variation is a singular one, but you may rely on the reply you have.—*Floral*. 1, Not found; 2, *Peperomia arifolia*; 3, Probably from an old plant of *Dracena marginata*; 4, *Dracena hybrida*; 5, *Selaginella Kraussiana*; 6, *Croton irregularis*; 7, *Dracena gracilis*; 8, *Croton variegatum*.—*D. Davis*. 1, *Bocconia frutescens*; 2, *Eryngium amethystinum*; 3, small Ivy; 4, *Tropaeolum speciosum*.—*A. H.* *Solanum Warscewiczii*, from *Warscewicz*, a Polish collector; flower white.—*J. M. O.* 1, Pear next week; 2, *Betonica carnea*; 3, *Coreopsis lanceolata*; 4, *Diplacus glutinosa*; 5, *Lythrum Salicaria*; 6, *Hedera*, perhaps *Chrysocarpa*.—*Scotchman*. Common bemp, *Cannabis sativa*.—*W. D.* 1, *Anchusa italica*; 2, *Eryngium Olivarianum*; 3, *Agrostemma coronaria*; 4, *Solidago virga aurea*; 5, *Catalpa bignonioides*.—*R. C.* *Viburnum opulus*.—*A. S.* *Achillea millefolium*, red variety.

ORCHID COLLECTOR: *Collector*. Advertise your wish to be a collector, or make an application to some large importing house.

PACKING FLOWERS FOR TRAVELLING: *C.* Pack in hinged boxes, 18 inches long, 10 inches wide, and 3 inches deep, made of light white deal; these being packed in crates of sizes suitable for easy handling. Line the bottom and sides with nice green moss if the blooms are delicate and easily damaged, and cover this with thin soft paper. Some flowers must be laid in singly, wrapped in tissue-paper; others may be bunched, such as *Narcissus*, *Tulips*, *Freessias*, and the like. To prevent rubbing, put in between heavy flowers or bunches little bolsters of soft moss, finest wood or paper-shavings; do not use wadding if you can help it. Pack the box moderately light, cover with paper and a little wood or paper-shavings over all. If the boxes are well made there will be little evaporation from the flowers and leaves, and they will present a fresh appearance when unpacked, even after a twenty-four hours' journey, provided the boxes have not been exposed to sunshine or artificial heat. Forced flowers in winter should be secured from frost by packing the small boxes in bampers or close crates with straw or hay placed round about them. Instead of tissue-paper, Cabbage, Vine, and Mallow leaves may be used, they retain moisture about the things packed, but add to the weight, and consequently the cost of transit.

POTATOS: *J. H.* It is probably a case of sporting or reversion to one of the parents of the Village Blacksmith. Such occurrences are rare.

FRENCH PISSARDI: *G. D. S. & Co.* Many thanks, the fruit is like that of the Myrobalan Plum of which P. Pissardi is probably a variety.

SEEDLING CARNATION: *S. J. B.* Quite worthless; there being some under name very much better.

THE BAR: *Determined*. Your question should have been addressed to some legal journal. We cannot tell you what you should do to become a member of the Bar.

VINES: *J. Urquhart*. We believe the appearances to be due to faulty management.

WIRE NETTING: *Protection*. Nothing larger than a mesh of $\frac{3}{4}$ an inch will keep out Tomtits.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.
 A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

SAM DEARDS' PATENT SELF-WATERING SHELF
 FOR PLANTS ON SHELVES.

Now on view at Stand 11, Block A, Horticultural Exhibition, Earl's Court, S.W.

ITS ADVANTAGES ARE—

- 1st.—No waste of water, all water being absorbed by the plants.
- 2nd.—Saving of three-fourths of the labour in watering.
- 3rd.—The plants are watered more naturally than by any other method.
- 4th.—All drip and water dropping from shelves to plants beneath entirely prevented.
- 5th.—Not a drop of manure-water is lost, all being absorbed by the plants.
- 6th.—A boy can do the work of a man.
- 7th.—A row of plants 100 yards long can be watered without walking a yard to do it.

SHOPMAN, or MANAGER.—Age 31, married; seventeen years' practical experience in Seeds, Bulbs, Plants and Flowers. Good testimonials.—P. STONE, Richmond Cottage, Catherine Street, Brompton, Chesterfield.

HOLLOWAY'S PILLS.—Hale Constitutions. —When the human frame has become debilitated from the effects of exposure, excesses, or neglect, these Pills will repair the mischief. If they be taken according to the fixed directions wrapped round each box, Holloway's Pills exert the most extraordinary tonic qualities in all cases of nervous depression, whereby the vital powers are weakened, and the circulation is rendered languid and unsteady. They improve the appetite, strengthen the digestion, regulate the liver, and act as gentle aperients. The Pills are suited to all ages and all habits. A patient writes: "Your Pills to be valued require only to be known. During many years I sought a remedy in vain, was daily becoming weaker, when your Pills soon restored me."

THOMSON'S

IMPROVED

VINE, PLANT, & VEGETABLE MANURE.

NONE IS GENUINE THAT DOES NOT BEAR
OUR NAME ON THE SACK.

AWARDED ONLY MEDAL
FOR
ARTIFICIAL MANURES
AT

500 Safrano	1500 Latanias and Kentias
500 Catherine Mermet	

Large quantity of other mixed plants. The whole will be found in first-class condition.

May be viewed. Catalogues had on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheap-side, London, E.C.

Tuesday, September 13.

TREE FERNS, DICKSONIAS, and CYATHEAS. **MESSRS. PROTHEROE AND MORRIS** beg to announce that they will include in their ORCHID SALE, on TUESDAY, September 13, a splendid consignment of TREE FERNS, including 14 grand trunks of Dicksonia antarctica, probably one of the finest lots ever sent over, ranging from 7 to 12 feet in length. Also CYATHEA DEALBATA, MEDULARIS, and CUNNINGHAMII; DICKSONIA SQUARROSA; 13 cases, containing 40,000 Seeds of MACROZAMIA SPIRALIS; a quantity of other Ferns in clumps and bundles, the whole received direct for unreserved Sale. On view morning of sale, and Catalogues had.

Lea Bridge Road, E.

ANNUAL UNRESERVED SALE of fine WINTER-FLOWERING HEATHS, &c.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. John Fraser to SELL by AUCTION, on the Premises, the Lea Bridge Nurseries, Lea Bridge Road, Leyton, E. (close to the Hoe Street Station, Great Eastern Railway), on WEDNESDAY, September 14, at 11 o'clock precisely, in consequence of the large number of lots, a large quantity of—

WINTER-FLOWERING and other PLANTS, including—

20,000 Erica hyemalis	2,000 Maréchal Niel, Gloire de Dijon, 8 to 10 feet.
1,000 Tree Carnations	Niphetos, L'Idéal, and other Tea-scented
4,000 Erica gracilis	Roses in great variety
10,000 Genista fragrans	1,000 Deutzia gracilis, established in pots for earliest forcing
6,000 Anemones Veitchii, 4 feet	6,000 Bouvardias, including a lot of President Cleveland
1,000 Epacris	5,000 Solanums, beautifully berried
2,000 Lapageria rosea superba	500 Ivy-leaved Geraniums, best double kinds
6,000 Cyclamen persicum, (Fraser's superstrain)	500 Grevillea robusta
2,000 Passiflora Constance Elliott and corolla	500 Aralia Sieboldii
400 Arancaria excelsa	200 Tacsonia van Volxemii
400 Large leaved Ceanothus	500 Boronias, of sorts.
200 Lapageria alba, from layers	
500 New scarlet Trumpet Honeyuckles	
1,000 Hollyhocks from named sorts with names	

And a great number of ERICA CAVENDISHII, CAFFRA, large-flowering White JASMINES, ABUTILONS, PALMS, and OTHER PLANTS. Also a quantity of young GENISTAS and HEATHS for potting on.

The whole of the Stock is in the best condition, and ready for immediate Sale. Hoe Street Station, on the Great Eastern Railway, is within a short distance of the Nursery. Trains from Liverpool Street every half-hour.

May be viewed. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheap-side, London, E.C.; and Leytonstone, E.

Clapham, S.W.

By order of Messrs. Charlesworth, Shuttleworth & Co. IMPORTANT to ORCHID GROWERS and the TRADE.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, 213, Park Road, Clapham, S.W., on TUESDAY, WEDNESDAY, and THURSDAY, September 20, 21 and 22, the whole of the extensive STOCK of ESTABLISHED and SEMI-ESTABLISHED ORCHIDS.

Fuller particulars will appear next week.

East Grinstead.—Without Reserve.

THIRD ANNUAL TRADE SALE of well-grown STOVE and GREENHOUSE PLANTS, fit for immediate Sale, by order of Messrs. Roberts Brothers.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, on the Premises, the Moat Nursery, East Grinstead, close to the Railway Station, on TUESDAY, September 20, at half-past 11 o'clock precisely, the following unusually WELL-GROWN STOCK:—

200 Specimen Eucharis, a grand lot of clean plants	50 Maréchal Niel Roses, rods 8 to 10 feet long
600 Solanum capsicastrum	500 Genista fragrans
800 Mixed Ferns	3000 Roses in pots
2300 Bouvardias of sorts, in 48-pots	1500 Adiantum cuneatum, in 48-pots
800 Cyperus	350 Grevillea robusta
	300 Euphorbia jacquiniiflora

Asparagus tenuis-sinus, Allamandas, Stephanotis, Gardenias, Raspad Geraniums, Cyclamen, Begonias of sorts, Palms of sorts, Callas, Violets, Spiraeas, &c.—in all, 20,000 plants.

May be viewed two days prior to the Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheap-side, London, E.C.

Henfield, Sussex.

Abutting on the London, Brighton, and South Coast Railway, about ten minutes' walk from Henfield Station.

By order of the Trustees of the late S. Clarke, Esq.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on WEDNESDAY, September 28, at 2 o'clock, in three Lots, the exceedingly choice FREEHOLD MARKET GARDEN and NURSERY, most favourably situated, and known as the Henfield Nurseries, Sussex, comprising a modern and convenient Brick-built Residence, 22 Greenhouses and Vneries, all heated; Pits, Brick-built Stabling, and other Trade Buildings; also Cottages, and another Dwelling House, Orchard, and productive Market Garden and Nursery Land, the whole containing an area of about 11 acres. Possession will be given on completion of the purchase.

Particulars and Plans had at the Mart; of Messrs. HOWLETT and CLARKE, Solicitors, 8, Ship Street, Brighton; and of the Auctioneers and Land Agents, 67 and 68, Cheap-side, London, E.C.

Catalogues.

MESSRS. PROTHEROE AND MORRIS have PERMANENT LISTS for their VARIOUS SALES, to which they are glad to ADD NAMES at any time for a REGULAR SUPPLY of CATALOGUES on learning the nature of the requirements of intending purchasers. 67 and 68, Cheap-side, London, E.C.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 3, 1892.

SANDRINGHAM.

ONLY those who have lately visited the gardens of His Royal Highness the Prince of Wales can have any conception of the amount of improvement which has been carried out there during the past year under the direction of the new gardener, Mr. Archibald Mackellar. Of course, there are time-honoured scenes around Sandringham House which it would be almost sacrilege to meddle with, and nothing that could be done could further enhance the natural beauties of the extensive drives through the brilliant Heather, now at its best, past copses full of Bracken, and abounding in game, and through dense woods of aromatic-smelling Fir. Nothing could well replace the stately avenue of ancient Limes running from the Norwich Gate to the mansion, and there is a quiet beauty in the walk under the old Scotch Fir trees leading to the picturesque church, and in other parts of the older garden which needs no improvement. Still, it has been perceived that the large quantities of cut flowers, fruits, and other productions of the garden rendered it imperative that the whole of the more modern parts of the establishment should be put on a proper footing; and so cleverly was the work planned, and so thoroughly was it carried out, that the necessarily heavy expenses may be regarded as so much money well invested. The heating of the whole, on one plan, by a simple and effective arrangement, may be regarded as a good example of horticultural engineering skill, and a specimen of the abilities of Messrs. Mackenzie and Moncur, of Edinburgh and Glasgow, who carried out the work. So well was this portion done by them, that not even accidents can seriously interfere with the efficient working of the heating apparatus, or endanger the inmates of any of the glass-houses. Two very simple matters, the non-observance of which have ruined in some places many a valuable crop of fruit, are here strictly carried out, viz., the avoidance of dips in the hot-water piping, and the chambering of all parts where these pipes have to pass below ground, so that in the event of anything being wrong with them, every foot of it can be easily examined.

The scene of Mr. Mackellar's greatest efforts lay in and around the walled-in kitchen garden, and we purpose touching on a few of the improvements, but, necessarily, our remarks must be brief. First, then, for the general plan of the walled-in garden. Starting from the gardener's pretty house, bright with flowers, we soon come to the scene of the late, present, and future improvements. A broad road runs down one side of a square, the high wall of which forms the back of the new offices (of which more anon), the opposite side being bounded by a wall

which is to be covered with climbers, and in front of which is a raised bank, planted with Roses, and faced with deep rockery edging where appropriate hardy plants are blooming. On the other side of the square is the beautiful and interesting model dairy, and from it a broad smooth gravel-walk runs across the inner garden, bordered on each side with hundreds of Carnations, Roses, Stocks, Mignonette, and flowers of a like nature. This walk is continued through the gates to the outer garden, and has at its termination a new plantation of shrubs, with facing greensward planted with spring bulbs. The other side of the square has its fruit wall, and profusion of flowers along the broad walks, all of which have been newly made. In the edging of these walks some 40,000 Staffordshire edging-bricks have been used, which, being almost indestructible, form the most economical of edgings in the end.

To return to the new works which have been undertaken outside the walls before-mentioned. The whole is arranged to match, and entrance is gained to each division by a door. First, is the boiler-house, whence warmth is obtained for the houses, offices, and, indeed, every place needing it. On the other side of the way is a large newly-constructed underground reservoir for rain-water, holding about 15,000 gallons, which, on being pumped up by a wheel-pump to a smaller tank on a higher level, supplies water to all the houses, &c. Then comes a large potting-shed, neatly fitted, and a well-arranged packing-shed. The next is the painters' workshop, and after that the Grape-room, with its stands, fittings, and inner walls of polished Pitch-Pine, the flooring of which is to be of mosaic. When completed and filled with Grapes, this room will be a sight worth going a long way to see. Beside this room is a compact seed-store, and an office, also fitted with polished Pitch-Pine; and continuing, we come to a large greenhouse filled with showy flowers. Then come the Mushroom-house and a second boiler-house, followed by a fruit-room some 70 feet in length, and lined and fitted also with polished Pitch-Pine. Beyond this last-mentioned room is a range of bothies, with a housekeeper's apartment at the end, and which are probably the most conveniently-arranged gardeners' bothies in existence. They are designed to accommodate 12 young men. All the woodwork is of polished Pine, and the furniture, bedding, and fittings are the best for the purpose which could be obtained. At one end is the fore-man's room, from which one passes into the mess-room, and so on to the kitchen, lobby for clothing, &c., in use; and the comfortable sitting-room and reading-room. Upstairs is a commodiously and perfectly, not to say expensively, fitted bath-room and set of lavatories, beyond which are the dormitories, all comfortably furnished alike; each man having his room with a number placed on the door. These examples of comforts for the men employed might in some form and in some degree, at least, be copied with advantage in other gardens of high repute, where the term bothies is only the dignifying title of tumble-down sheds. Beyond the bothies another large boiler-house has been built for the new ranges which are in contemplation. Continuing up the walk, we come to a range of heated frames for vegetable culture, 400 feet in length. At Sandringham there are more than 100 acres of garden and well-kept pleasure-ground, 14 acres being devoted to the kitchen garden, no part of which is allowed to be without a crop, so that the forty or more men which comprise the garden staff require to be ably handled. Of course, during the progress of

large works, many more than these are employed. The kitchen garden strikes one by the large area occupied by each crop, and the general excellence of the methods of cultivation pursued. Veitch's Self-protecting Broccoli and Veitch's Main Crop Onion here, as in other places, come in for a good word. Ten thousand heads of Celery are wanted in a year, and more than that has to be planted. Strawberries in pots are well and extensively grown. Apples and Pears are scarce this year, as are some other kinds on the old trees, but on the strong young trees supplied by Messrs. J. Veitch & Son last spring, and in 1891, and especially the Plums and Cherries, there has been an abundance of fruit.

THE GLASS HOUSES.

The first range entered was a long one, consisting of vineries with Vines well cropped. Many of the old vineries have been condemned, but the sacrifice of even unsatisfactory Vines is a thing not to be done hastily where supplies must be kept up. The next block we came to consisted of forcing-houses. Here we found 1500 Poinsettia pulcherrima, and in others Tomatos were growing and carrying good crops of fruit; then comes a range of Melon-houses, with plants in fruit in all stages, and a number of fine Crotons of sizes suitable for table decoration; and with these were Gardenias grown for cut blooms. The next that we entered was a range in three divisions, containing in the first division Gardenias in fine health; in the second Crotons, Dracenas, and other decorative plants; and in the third a wonderful show of Eucharis grandiflora, the whole house being full of plants in full bloom.

After this, an Orchid range in three divisions was visited, in the first being Odontoglossums, Masdevallias, and other cool Orchids; in the second, Cypripediums, Dendrobiums, &c.; and in the third, Cattleyas and Lælias, all in a condition promising rapid improvement. Entering the next, a lofty house with the wall beautifully furnished with Ferns and foliage plants, we found tall Palms and many Dracenas. Then a range intended for Orchids was noted, but at present it is only partly occupied with these plants. There were likewise houses and frames in which the most noticeable thing was the enormous stock of plants of Souvenir de la Malmaison Carnations in the best condition. These flowers are favourites at Sandringham. Turning again to the fruit-houses, we find range of vineries, and Peach and Nectarine-houses were remarked, most of which have been newly planted, and with trees which bear or have borne good crops this year; and, continuing, we find large quantities of Cyclamen, Primulas, Chrysanthemums, Cinerarias, and other flowers for autumn and winter use, and abundant evidence of succession stock on every hand.

Passing to the terrace in front of the hall, the newly laid out geometrical garden was aglow with scarlet, pink, and other Pelargoniums, besides other bedding plants, the salient points being marked by pyramid golden Yews, which form a fine feature in the garden, and which will greatly improve with age. From this point the eye takes in the beautiful grounds with its fine Oaks and the many interesting trees planted by Royal visitors. Here also a view is to be got of a part of the chain of lakes which flow into each other, and empty into a large lake in a more distant part of the grounds. These stretches of water upon which Mr. Pulham was engaged some few years ago, are being thoroughly cleansed, are furnished with rockeries at certain points, and they are connected with each other by rocky

rivulets constructed in a very natural and pleasing manner. Mr. MacKellar is taking much pains with the planting, which should, on its becoming established, give an admirable effect. On the edge of one of the lakelets is a fine aged Weeping Willow, and near by are grand specimens of Sequoia gigantea, which still retain their perfect form, although they are of such large proportions.

Following the lakes round to the Bachelor's Cottage, now being renovated and enlarged, the keeper's house appears. This building is bright with flowers in front, and creeping plants on the walls, the beautiful greensward between it and the pheasantries, kennels, &c., being excellently kept. Beyond this point is the deer park with its hundreds of deer; near by is a maze formed of Thua gigantea; then comes the wild garden, an orderly wilderness, very beautiful of its kind, and then across the large tennis court. By this time we had come to the conclusion that Mr. MacKellar had done much good work in the short period of time that he has been at Sandringham. It may now truly be said that Sandringham gardens take rank with the best in the world.

NEW OR NOTEWORTHY PLANTS.

DISA COOPERI, Rehb. f.*

This pretty Orchid, of which we give an illustration (fig. 45), was imported and flowered by Messrs. F. Sander & Co., of St. Albans, and exhibited by them at the Royal Horticultural Society on February 9 of this year, when a Botanical Certificate was awarded for it, this being in all probability the first time that the plant has been seen alive in Europe. Afterwards it was sent to Kew, and a drawing of it has been made for the *Botanical Magazine*, in which a coloured plate of it will shortly appear. It is a native of the eastern part of South Africa, and was discovered by Mr. T. Cooper in the Orange Free State in 1862, and although Reichenbach did not publish his description of it until 1881, it was about the year 1868 when, on purchasing the first set of Mr. Cooper's collection of South African Orchids, he pronounced the name it was to bear, for upon looking through that collection he came to this one, when, in his characteristic manner (as Mr. Cooper himself told me the next day), he held up his hands and exclaimed in (as nearly as I can recollect at this distance of time), some such words as these:—"Ah! what a beauty; that is new, and I will name it *Disa Cooperi*." Although it does not possess the brilliant colours of some of the species, it is nevertheless a very attractive Orchid, and the long, slender, nearly erect spur give the flowers a very quaint and not ungraceful appearance, quite distinct from any other species at present in cultivation. The plant grows from 15 to 24 inches in height, and is quite glabrous. The leaves are 4 to 7 inches long, $\frac{3}{4}$ to $1\frac{1}{4}$ inch broad, lanceolate acuminate, and clothe the stem to the base of the flower-spike, gradually passing into the bracts, which are from $\frac{3}{4}$ to 2 inches long, and $\frac{1}{2}$ to $\frac{3}{4}$ inch broad. The flower-spike is from 6 to 12 inches in length, with numerous rather closely-placed flowers about 1 inch in diameter. Dorsal sepal helmet-shaped, tapering into a straight or slightly flexuose, nearly erect, slender spur 1 to $1\frac{1}{2}$ inch long; the colour is pale rosy-carmine, or white tinted with carmine; lateral sepals $\frac{1}{2}$ to $\frac{3}{4}$ inch long, oblong obtuse, with a short dorsal horn at the apex, spreading and somewhat reflexed, rosy-carmine. Petals obliquely rhomboidal, clear greenish-yellow, standing erect at the inner sides of the dorsal sepal. Lip shortly clawed, triangular, with the angles obtusely rounded, flat, slightly keeled down the centre, rather thick and fleshy, of a clear greenish-yellow, and hanging down in front of the ovary, so as to be very conspicuous.

* *Disa Cooperi*, Rehb. f. in *Flora*, 1881, p. 328.

The following specimens of it are in the Kew Herbarium:—Orange Free State, Cooper, Nos. 1098, 1871; Transvaal, Dr. Atherstone; Matutiele, Griqualand East, Tyson, No. 1606; Oliviera Hoek, source of the Tugela River, Natal, Allison, No. 27; Natal, Fanin, No. 2. It grows among grass at an elevation of about 5000 feet above sea-level, and, according to Mr. Allison, in wet soil, flowering in January and

and of which we give an illustration (fig. 48), is undoubtedly one of the most beautiful annuals that has been introduced into cultivation for some years past. It is remarkable that it has not found its way into our gardens long before this, for, although it was described over half a century ago, this appears to be the first time it has been cultivated in Europe. Possibly this may be accounted for by its being a local

lanceolate or linear, distantly toothed, and quite glabrous on both sides, the radical leaves narrowed into a stalk, those on the stem sessile and opposite. The flowers are in compact corymba, terminating the stem, and its branches lengthening into racemes as the flowers fall away. The bracts, pedicels, calyx, and outside of the corolla, are all glandular-pubescent. Sepals linear oblong, spreading, free nearly to the base. The corolla is from $\frac{3}{4}$ to 1 inch in diameter, two-lipped, the upper lip being 4-lobed and glabrous within; the lower lip has a short, broad spur, and a broad transverse front lobe, notched at the apex, hairy within, especially in the throat. The colour of the flowers is exceedingly variable, being white, ochreous, pale yellow, deep yellow, orange, orange-scarlet, magenta, carmine, light rosy-purple, orange stippled with orange-brown and shaded with mauve, &c., the throat being dotted with blackish on a yellow ground, and the outside is often veined and marked with purple.

This variation in the colour of the flowers is one of the most interesting features of the plant, for plants which vary in a wild state to such an extent as this species does, are very few indeed. As this is its first introduction into cultivation, the variation is in this case not a product of the gardener's art, and the dried specimens show that it varies in the same manner in Nature. There are many plants that vary to the extent of two or three colours in a wild state, but it is exceedingly rare to find them indulging in such wholesale variation as this *Nemesia* does. I have seen sixteen varieties of colour, all of them very brilliant and beautiful, and a bed of them mingled must be a very charming sight; the flowers being large, showy, and abundant, it is certain to become a very popular plant. There are many other species of *Nemesia*, all of them free-flowering, and several that are well worth cultivating; the different species have white, yellow, blue, or purple flowers, but, so far as the dried specimens show, each species has its own colour, and does not vary like the present plant. *N. E. Brown.*

[The construction of the flower is curious, the corolla, as above described, is tubular, and irregularly two-lipped, the upper lip consisting of four obtuse segments, with two purple spots at the base of each; the lower lip is of a single segment only, but much larger than the other four, at first rolled inward, afterwards unfolded and prolonged at the base into a broad, obtuse, somewhat two-lobed spur, the whole corolla more or less covered with spots and hairs. The stamens at the base are connate, with the corolla-tube in pairs, two long, two short, one pair above the other, and in the same vertical plane. The posterior stamen is missing. The two-lobed anthers open just about the level of the purple blotch at the base of the upper lip of the corolla. The young fruit consists of two carpels, placed in the front and back of the flower, compressed from side to side with divergent, falcate tips, between which the short style is placed. Seeds numerous, tubercled and bordered by a deep membranous wing. In two-lipped corollas, the upper lip is usually of two, the lower of three combined petals. The infolded lower lip reminds one of some *Calceolarias*. Messrs. Sutton are to be congratulated on the introduction of so desirable a plant. We subjoin for comparison the figure of *Nemesia cynanchifolia*, introduced by the late Lieut. D'Ombraïn. (See *Gardeners' Chronicle*, August 2, 1879.) Ed.]

FIG. 45.—DISA COOPERI: COLOUR, ROSY-CARMINE. (SEE P. 268.)

February. It is stated to be very fragrant. The Kew plant was scented something like Cloves *N. E. Brown.*

*NEMESIA STRUMOSA, Benth.**

This charming plant, which was exhibited by Messrs. Sutton & Sons, of Reading, at a recent meeting of the Royal Horticultural Society at the Drill Hall,

* *Nemesia strumosa, Benth.*, in *Companion to the Botanical Magazine*, vol. 2, p. 18 (1836); and in *De Candolle, Prodrornus*, vol. 10, p. 260.

plant, like very many other members of the great South African flora, for it is a native of the south-western part of Cape Colony, and grows in the neighbourhood of Saldanha Bay, and at Doornhoogde; but, to judge from the material in the Kew herbarium, it does not appear to have been met with by any collector since the time of Drege and Zeyher.

Nemesia strumosa is an annual, growing from 6 inches to 2 feet in height, the upper part of the stem covered with glandular hairs. The leaves are

ORCHID NOTES AND GLEANINGS.

LELIA ANCEPS ALBA VARIETIES AT TRING PARK.

A HOUSEFUL of large specimens of the various forms of white *Lælia anceps* in Lord Rothschild's collection will shortly be a fine sight, the plants being in matchless vigour and plentifully set with stout flower-spikes. Among them is a very fine specimen *L. anceps Williamsii*; and all the other varieties are equally good. One of the favourites is *L. a. Schroderæ*—perhaps the most massive, and purest white flower of any of

these varieties. Mr. Hill grows the plants in a tolerably sunny house, which is kept rather warmer than most growers favour, and to which he attributes much of his success with them. The fact of their young leaves being so firm and of such a rich green shade of colour, shows that the conditions afforded agree with them, to say nothing of their abundant flowering. Cattleyas are as well done as *Lalias* at Tring Park, and a fine show has been witnessed there of good forms of *Cattleya Hardyana*. *J. O.E.*

NEW CATTLEYA.

A remarkable natural hybrid (*C. gigas* × *aurea*) is now blooming with M. J. Viacke-Dujardin, at Bruges. The sepals and petals are the same size as those of *C. aurea*, but the colour, instead of being rosy-lilac, like that of *C. gigas*, is pinkish, the ribs and veins plainly traced out in white. The lip is in size different to that of *C. gigas*; in shape and size it is like that of *C. aurea*, the lip of *gigas* having two yellow marks, which in the hybrid spread to the centre; a beautiful velvety golden-yellow suffuses it everywhere, but in the lip reaches only to the centre; the base of the lip is rosy-purple, the top of it the colour of *C. gigas*, or, rather, a shade intermediate between that of *C. gigas* and *C. aurea*. In a second variety this secondary tint is of the same blackish-purple as in *C. aurea*, velvety, and of great richness.

CYPRIPEDIUM CALLOSUM VAR.

This, one of the best varieties known, is also in bloom with the same orchidist. The lip, of great size, has strongly-marked streaks of purple; a charming shade of purple also spreads between the stripes, and is exceedingly effective against the white ground.

CYPRIPEDIUM SP.

The above-named orchidist has also just flowered an imported *Cypridium* for the second time. In form it resembles *C. Godefroyae*, the flowers are pure white with spots all along the veins; these marks are purplish-lilac, larger than in *C. Godefroyae*, better arranged, less straggling, and not confused with the white. The edges of the parts are delicately fringed. The lip is egg-shaped, pure white, unspotted outside, inside delicately speckled with the same shade. The white staminode is also speckled, with a pretty bright yellow spot in the centre. The flower is of excellent size, measuring nearly 3 inches across; it is borne on an erect, straight, and sturdy peduncle, differing from those of *C. Godefroyae* and *C. bellatulum* in length, in fact, it measures from 4 to 5 inches. The leaves are much longer than those of *C. Godefroyae*, which are 6 inches by 1½ inch; they are glassy-looking, clear green, blotched with greenish-white, very firm in texture. The plant is more vigorous than *C. Godefroyae*. *Ch. de Bosschère.*

PINE-APPLE CULTURE.

SINCE foreign Pine-apples have become plentiful in our markets, the cultivation of this noble fruit has been discontinued in many gardens. This is, I think, a pity, for good home-grown fruits are much better in quality than imported ones. They can also be had at any season in the year, which is not the case with their rivals, while their culture incurs less trouble than that of some other indoor fruits; but pains are sometimes taken in this particular which are unaccompanied by tantamount results. Low, light structures are important factors to the successful culture of the Pine-apple; it is also essential that they should be thoroughly heated, and placed in a sheltered, sunny situation, for although this plant, when under glass, requires to be slightly protected from powerful sunshine, it nevertheless enjoys abundance of warmth and light. A suitable soil is another necessary requirement; that which we use is a light fibry loam, skimmed from a stony old sheep pasture, situated on a border of the Forest of Dean, and stacked for about nine months before it is used. Soils of this nature are best used in a moderately dry, warm, and rough state, having any fine particles removed; and they should be enriched with Thomson's Vine Manure, or a similar fertiliser, to the

extent of an 8-inch potful to one barrowload of soil. Grand Pines can, however, be grown by the use of liquid manures, without the aid of other manurial agents, although we find a manifest improvement is made by their assistance.

It is advisable to grow only a selection of varieties, and a good one is the Queen for summer use; whilst Smooth-leaved Cayenne and Charlotte Rothschild are excellent for winter fruit. Plants may be readily raised either from suckers or crowns; the former are most easily procured, and usually produce fruits in a shorter space of time than the latter—at the same time, I have a liking for crowns, as they form very compact plants with stout stems, and we invariably gather our best fruits from them. Queen suckers are generally plentiful about the end of August, when sturdy, mature ones should be selected and prepared for potting by having their jagged ends and a few of their bottom leaves removed, clean, efficiently-drained 8-inch pots, with a layer of moss, coated with soot, over the drainage, having been prepared, the suckers should be placed in them, and the compost be made sufficiently firm about them to keep the plants perfectly steady. The pots should then be firmly plunged in a bed of decayed leaves or tan, placed over hot-water pipes, and having a steady temperature of 85°, and the soil be moistened through with tepid water. The temperatures may now vary from 65° at night to 75° by day, with a moderate rise from sun-heat, and during the brightest part of the day, until the suckers are rooted, thin shading must be provided, and the suckers be gently syringed early in the afternoon. The object now in view should be to keep the plants robust, and to this end air must be given whenever the weather permits, with only a moderate amount of atmospheric moisture, and sufficient water to keep the soil moist. Towards the end of October the temperatures may be gradually lowered, until they reach by the middle of November, 55° at night, and 60° by day, the bottom-heat being 75, and these will suffice during the resting period.

In February the plants will show signs of growth, and having their soil moist, and fairly filled with active roots, will be in fit condition for shifting into their fruiting pots. In this operation the compost and pots (12-inch) should be prepared in a similar way to those recommended for suckers, a few of the bottom leaves be separated from the plants before turning them from their pots, and the surface of the old soil covered an inch in depth with the new compost. I also advocate very firm potting, provided the soil is of the nature and condition recommended. If the pots are properly plunged 2 feet asunder in a firm bed of decayed leaves, they need not be moved again until after they have fruited; indeed, this is our practice, and we find it preferable to re-plunging at a later period, after the plants have become large, as this cannot be accomplished without incurring some injury to the plants. The spring and summer treatment will be of a routine character. Water must be very moderately supplied until the roots have made considerable progress, when it may be more liberally used, and be slightly enriched with guano, but over-watering must be rigidly avoided. The temperatures should be gradually increased until they reach 70° at night by the middle of April, and from 75° to 80° by day, the bottom-heat being 85°, and air may be carefully admitted when the thermometer touches 78°, and then regulated according to the weather. The necessary moisture can be maintained by damping the pathways at 6 a.m., again at noon, and by gently syringing the plants and surface of the bed when the house is closed for the day. The shading must also be carefully attended to, and all suckers removed. Plants treated as directed make rapid progress in August and the early part of September, when a carefully-regulated circulation of air is necessary to prevent an attenuated growth. In October the moisture must be gradually reduced, and the temperature also, until by November it falls to the point that was recommended for suckers during winter.

In order to have ripe fruits for the London season,

a time when Pines are valued, the temperature must be raised to 60° or 65° at night, and 70° by day, and the bottom-heat to 85°, by the first week in January; and should the plunging-material have become severed from any of the pots, the defect should be rectified. The atmospheric moisture must likewise be correspondingly increased, and more frequent attention to watering with tepid guano-water will be needful. Where practicable, a top-dressing of Thomson's Manure at this time, and again subsequently, when the plants have blossomed, will be of great benefit. Once the plants show fruit, the temperature should be raised to 70° at night, and 75° to 80° during the day, and a moderately dry state of the atmosphere must be upheld during the flowering period; the latter particular must be vigorously carried out, otherwise an imperfect set may ensue, and, consequently, deformed fruits. The subsequent treatment, until the fruit begins to change colour, may be similar to that advised for successional plants, except that overhead syringing may be discontinued, as this causes an enlargement of crowns; and a few suckers should now be left to supply future wants. When the fruits commence to change colour, a gentle circulation of air, both night and day, should be preserved, with less moisture in the air; and water withheld from individual plants as their fruits commence to ripen.

Cayennes and Rothschilds treated as above, ripen fruits about a month later than Queens; and strong suckers, potted in February, and a month or two later, or crowns rooted at intervals during winter, afford a supply of fruits in the autumn and winter months. *Thos. Coomber, Hendre Gardens, Monmouth.*

OUR DOCTOR'S GARDEN.

WHETHER it be that botany being formerly among the prescribed subjects in the curriculum of an embryo doctor, or that the result is merely due to a liberal education, the fact is patent that next to the parson's, the doctor's garden is best in most villages and towns, and not infrequently next before the "rectory garden."

In the little town which has been my home for some thirty years, our doctor's garden is *facile princeps* "the garden," and under the care of Mr. John Tabor, the head gardener, aided by the encouragement supplied by Dr. Wilks, everything is well done. Within a space of about 2 acres is concentrated as complete an establishment as is not often to be found.

The lawn is irregular in shape, with a broad sloping border round, now planted with gay bedding plants, with the exception of that portion along the front of the vinery, which is planted with dwarf foliage plants, *Alteoranthra*, succulents, *Coleus*, &c. One bed on the lawn discloses the leading passion of the proprietor, as, though only 4 feet in diameter, I noted no fewer than forty growths of *Cypridium* spectabile, each showing a strong bloom-spike, and some already of the colour in bud. This bed had only a slight protection during the winter with cocoa-refuse, and a little shade is given now. *C. calceolus*, although tried, has not been so successfully grown.

On the east side of the lawn is the fruit garden, and on the north a small kitchen garden, judiciously cropped, with all that is necessary for a small establishment; but even this is invaded by a young army of *Chrysanthemums*, the second leading feature here, this cadet force being kept in order by some veteran old plants, which took the prizes last year in open competition. These, Mr. Tabor says, will be of great value to him in the early autumn for decoration, as they throw a great wealth of fair-sized flowers, and are earlier than the yearling plants. Here, too, under a south wall are a few large specimen *Ericas*, already promising a fine display of bloom.

The walls are well furnished with Peaches, Nectarines, and other stone fruits, and a few Pears, all of which are holding a plentiful crop, which is fortunate, as the Peaches in the Peach-house are not fruiting, the probable cause being the specimen

Chrysanthemums were housed here, and their success was not compatible with the welfare of the Peach trees.

Here in the shade were the foreman and his assistants busy putting Chrysanthemum plants on their umbrella-shaped trainers, a form of growing done here with marked success. Grapes are grown in this and another house, but they are not a leading feature.

As a warning to beginners, it will be judicious to mention, that the Vines were on one occasion slightly sponged over with a sponge from which all superfluous paraffin oil had been squeezed, and this was successful. Following this up, however, with a more copious application, the result was that the Vines were killed back, and only with the greatest difficulty was enough uninjured wood found to refurbish the house. Moral.—Beware of paraffin oil!

In this house, under the Vines and Peaches, were

with some fine Loquats, a plant of *Mackaya bella*, *Agapanthus umbellatus*, and a nice specimen pot of the white-flowered *Agapanthus*, some clean plants of *Ipomœa Horsfalliæ*, with some little plants of hybrid Javanese *Rhododendrons*, with here and there zonal and large-flowered *Pelargoniums*. On the warm side of the house was *Lasiandra macrantha*, which, grown in small pots, is starved into free-flowering habit. Nor would a well-flowered bulb of *Euryclea australasica* allow one to pass without notice, nor could I fail to be attracted by a specimen of *Anthurium Scherzerianum* carrying twenty-eight well-developed spathe, and a still finer specimen of *Cypripedium villosum*, these being staged here to retard them; while on a slate shelf at the side, cool and shady, was a small and select batch of that fickle but lovely terrestrial Orchid, *Disa*, in variety, looking happy and promising.

Dr. Wilks, being an ardent musician, gives during

the plants are staged, their pots are screened and partly hidden by pans of *Fittonias*, *Selaginellas*, and such-like plants.

The Orchids have three houses devoted to them, and taking first the cool-house, our constant friends, the *Odontoglots*, claim first notice. Here are numerous *O. Alexandræ*, *O. Pescatorei*, *O. vexillarium*, and *O. cariniferum*; besides happy-looking plants of *O. Cervantesii* and *O. Edwardsii*; *Masdevallias* in robust health, but, with the exception of the "Bottle Imp" variety (*M. chimera*), now past flowering; *Dendrobium infundibulum*, with a good spike; and pots of strong pseudobulba of *Calanthe natalensis*, giving variety to the collection.

Of *Dendrobes*, some eighty varieties are under Mr. Tabor's care, while such useful kinds as *D. nobile* and *D. densiflorum* are grown in quantity, to give a long succession of flower. In suspended and staged pots and pans are some good examples of *Cœlogyne cristata*, this being grown largely, as the flower is a favourite button-hole with "the Doctor." Here, too, are *Saccolabiums*, *Vandaa*, and *Aërides* in fine examples and variety, while along the ridge of the West India Orchid-house is trained the gorgeous *Hibiscus rosa-sinensis*, now in full flower, and paling everything near by its brilliant colouring. Nor must a fine plant of *Dendrobium Dalhousieanum*, with eight flower-spikes, and a similar plant of *thyriflorum*, be unrecorded. *Cypripedia* are represented by no fewer than seventy varieties, some being fine examples of successful culture, the best being *C. caricinum* in a shallow pan; *C. Curtisi*, very fine; *conchiferum ciliolare*, and *Hartwegii*, these being now in flower, *Thunias* are well done, *Marshalli* showing flower, and *Bensonæ* in flower; while *Calanthes* are largely grown, their winter-flowering being a great desideratum here.

But without attempting to emulate the length and dryness of an Orchid catalogue, it would be a grave omission to leave unnoticed a few other genera that are well done, as the *Brassias*, *Maxillarias*, *Aërides*, and *Epidendrum*, all of which in leading and many rare kinds find a place in this collection. Here, too, is a good plant of that not easily done *Grammatophyllum Ellisii*, and to somewhat relieve the sameness here and there a good specimen Fern is introduced. A fine plant of *Adiantum Williamsii*, *Gymnogramma Alstonii*, and *Peruviana argyrea*, of which the head gardener says he lost two bought specimens, but to his joy he found they had left a legacy of countless seedlings behind, and these make healthy and vigorous plants, which he attributes to their being acclimatised. Here, too, are *Impatiens Hawkeri*, but having too much pot-room, only sparsely flowered; and a fine and vigorous plant of that very rarely well done *Liliad Gloriosa superba*, carrying plenty of its grotesque flowers.

There I finished my inspection, well pleased with all I had seen, and more than ever convinced of what may be done where the master and man work together with one common aim. *T. B., Ashford, June.*

FIG. 46.—HYBRID BETWEEN BLACK CURRANT AND GOOSEBERRY. (SEE P. 277.)

the specimen *Azalea indica*, *Camellias*, and such plants making their growth; while three good specimens *Dipladenias*, *Brearleyana* and *amabilis*, were promising soon a rich display of flower.

In a little inside structure in this range were growing and looking delightfully cool and comfortable on this particularly hot June afternoon, a pretty representative collection of filmy Ferns, the best being *Leptolepis pellucida*, *plumosa*, and *superba*, a fine piece of *Trichomanes radicans*, and *Hymenophyllum demissum*, *crispatum* and *nitidum*, with them being associated a few *Selaginellas* and *Aspleniums*, which seem to revel in similar treatment to the filmy.

The large show house was gay and fragrant, except in one corner, where the bizarre but fetid *Aristolochia gigas* was in flower, and diffusing its abominable odour around, making more welcome our approach to two or three well-flowered and clean *Stephanotis floribunda*. Here, too, were several well done pieces of the elegant Japanese *Astilbe* (*A. astilboidea*), which had been gently forced, while the central stage is filled up

the year a series of concerts; the contents of his glass-houses are requisitioned to decorate the orchestra, so that his friends and the public not only have a musical treat, but really a good flower show also.

For this purpose many large specimens are grown, among which may be noted standing on the floor of this house, *Pandanus Veitchii* in fine colour; *Anthurium crystallinum*, *Veitchii*, and *Warocqueanum*, a grand plant of *Medinilla magnifica*, *Clerodendron Balfourii*, well-flowered, and the older but handsome *C. speciosum*. Some beautifully-furnished plants of *Comaria gibba* lend their graceful greenery, and contrast strongly with the monster specimens of *Eucharis amazonica*, the length of foliage to them averaging 2½ feet, which give good promise of a wealth of their lovely pure white flowers in season. We have here also large specimens of some Orchids—for instance a *Vanda insignis tricolor*, with fifteen leads, averaging thirteen pairs of leaves each. *Vanda Batemanni*, almost as large, with a grand spike of flower now coming, and large masses of *Vanda teres*, now, of course, out of flower. Where

TREES AND SHRUBS.

SCIADOPITYS VERTICILLATA.

The Japanese Umbrella Pine is one of the finest Conifers yet introduced. Its fine bold commanding foliage marks it as one of the most distinct trees from Japan. In its natural habitat it is said to grow from 80 to 100 feet high, but in England I am not aware of plants more than 20 feet. We read in *Veitch's Manual of Conifers*, the first living plant was received at the Exeter Nursery in 1853, but in a weak state of health, and soon afterwards died; but eight years later, Mr. J. G. Veitch sent home seeds which germinated successfully. Being of a slow-growing nature, it is considered by some to be a difficult subject to manage satisfactorily. It should have well-drained ground, good peat soil, and be protected from east winds. Under such circumstances it will be found to thrive well. A very important item in the successful transplanting of this or any

other tree is to take it up with as good a ball as possible, so that the roots may not be disturbed, and that the plant suffer no check by the operation; the hole for its reception should be ready before the plant is moved, and if the soil is poor, a good addition of peat and leaf-mould added. If the plant is to be taken far, mats or tiffany should be placed round the ball to protect the roots from drying winds; and if the ball falls to pieces, as it often does if the soil is light, and the roots get injured, protect the plant from the sun for a time until it gets hold of the new soil by placing tiffany over it, giving it a damping occasionally. It is very partial to leaf-mould, which should be served as a top-dressing annually. During its growing period it should be kept moist at the roots, but great care should be taken not to over-water it, as it will soon show it by wearing a sickly appearance. It is well worthy a place in the grounds of the most select garden. Standing as single specimens on the lawn, it has no equal amongst the numerous Coniferae, and it is suitable for all kinds of ornamental planting. Its very handsome rich shining green leaves are thick and narrow, measuring from 3 to 5 inches long; they are arranged in whorls, varying in number up to about forty. It was introduced in 1861. *H.*

BRITISH FERNS UNDER GLASS.

UNDOUBTEDLY much of the neglect to which our native Fern varieties have been subject is due to the fact that, in the majority of cases, they are treated no better than the normal forms, and hence, have had little or no opportunity of developing the much greater delicacy which many of them possess. The comparatively coarse common specific forms do well enough out-of-doors, provided only that they are not located in a very temple of *Aeolus*, where they are blown to rags, or in a baking southern aspect, where they are burnt up by the blazing sun. Given, however, moderate shade and protection, they can be massed to great decorative advantage in many situations where a general effect of feathery verdure is a desideratum. When, however, we examine the more delicate abnormal forms in question, we shall find a large number which, under the climatal conditions of most of the British counties, especially the drier eastern ones, absolutely require the protection of glass in order to be able to assume their full character, their finely-cut foliage being ill-fitted to stand the wear and tear of occasional storms, the brunt of which would be well-borne by their robust relatives. With many of the heavily-tasselled varieties, too, the accumulated weight of water in the crests is not only sufficient frequently to break them down, but the density of these crests is often such that the water does not evaporate from their centres, and rotteness is apt to ensue; so that plants of these classes, when exposed, are bound in time to assume a stunted growth, which makes them poor representatives of their true selves. Hence, those who make a specialty of our British Ferns, unless they dwell in very congenial localities indeed, such as are found in our ferniest western districts, are usually compelled to devote either a cold house or frames to a portion of their collection.

For such a purpose, the ideal fernery is a sunk house, a sort of cutting roofed in with glass, as in such a structure we have the best guarantee for that persistent cool and humid state of the atmosphere in which Ferns delight. Ample top light and little or no sunshine should be aimed at. Inside such a house as this, which should not be heated in any way, the Ferns can be accommodated, either (1), in the soil itself in tastefully arranged rockwork; (2), in pots sunk in the soil; or (3), it may be provided with staging in the usual way. In our experience, however, it is well to choose the middle course, i.e., to sink the pots in the soil or mask them with the rockwork, rustic pots of course aiding considerably the more natural aspect aimed at. Some of the larger plants can, of course, be planted with advantage in the soil; but if all be so treated, they cannot be so easily shifted and readjusted, when a change of

position is found desirable owing to the disappearance in winter of the deciduous species, or the rapid growth in spring and consequent crowding, which, under congenial conditions, is certain to occur. In building up the rockwork, suitable nooks and pockets are easily constructed for the various sorts of pots, ordinary, rustic, flat-sided, and so on, so that with a little care and taste, the general natural aspect of the rockwork need be little interfered with, while the advantages of easy shifting as the Ferns develop will speedily manifest themselves.

As we have stated, no heating apparatus should be used. All our native species, with the exception of the Sea Spleenwort (*Aapl. marinum*), and the Maidenhair (*Ad. Capillus-veneris*) are perfectly hardy, and are even benefited by being subjected to the usual rigours of winter. To exclude frost by artificial heating prevents them from resting thoroughly during the winter; hence it will be found that in January or February they are apt to start into premature growth, the effect of which will be certainly evidenced in weakened development, and probably vermin galore in the proper growing season. In our own fernery, which underlies our article as a text does to a sermon, all the plants are frozen hard from time to time during the winter; but with the exception of the two tender species already named, we have never lost a plant on account of the weather. Care must, however, be taken, especially with the dormant deciduous Ferns, such as the Lady Fern, some of the *Lastreas*, and others, which are peculiarly liable to get overlooked, that none of the species suffer from drought.

Although they are asleep, drought at this period saps their vitality terribly, and if we look to Nature as our guide, we shall learn that it is precisely at this season, under natural conditions, that they are kept at their wettest, most habitats being absolutely in a soaking condition all through the winter months. Our practice, in conformity with this teaching, is to keep the crowns constantly well damped, the benefit of which is speedily seen by their plump appearance in early spring prior to rising into vigorous growth in April or May.

Naturally, even in a perfectly cold house, the protection afforded and the elevation of temperature due to confinement on sunny days, have a slight forcing influence, inducing a week or two earlier start than out-of-doors. This, however, has no detrimental effect, as it merely gives them the climatal conditions of the warmest localities in which they are indigenous, and where, indeed, they thrive to the utmost.

Watering, when the fronds are up, should never be on the overhead system. Showers, heavy and light, are certainly afforded by Nature out-of-doors, but it must not be forgotten that she also gives an ampler circulation of air, and engenders a hardier growth than is arrived at under glass. The crested and heavy plumose forms too, are, as we have already indicated, liable to be broken down and seriously damaged by being drenched with water. Most of our own Ferns have never had a drop of water upon their fronds, and yet they are beautifully fresh. As regards water at the roots, that in all cases must be ample, but drainage must be provided, and glazed saucers on no account used, since, even if plenty of drainage be in the pots, if it stands constantly in water, sourness is apt to be engendered, and then, good bye to the health of the plants.

With regard to temperature, in hot dry weather all means should be taken to keep the temperature as low as possible by means of judicious ventilation and shading, but the ventilation should not mean draughts, nor the shading mean gloom, since the more light, bar burning sunshine, the greater the health and beauty of the Ferns. In the shadiest portion of the house, a few Wardian cases would be at home for the accommodation of a collection of Filmy Ferns, of which besides our native *Hymenophyllum* (*H. tunbridgensis* and *unilaterale*), and the Bristle Fern (*Trichomanes radicans*), of which latter there are several marked varieties, a number of charming exotic forms are hardy enough to stand our climate. Among these, the two gems *Todea*

superba and *T. pellucida* form grand specimens in a comparatively short time, and are seen to best advantage when given a case to themselves. Lumpy sandy peat mixed with pieces of sandstone, and amply drained, suits all we have named and most of the others.

Various methods of masking the walls may be used with advantage. We have seen a wall covered with slabs of brown fibry peat, kept in place with galvanised wires fixed to the wall by nails. This speedily becomes alive with young Ferns arising from spores. Moulded wall tiles are also made to affix to the walls, and contain soil, and a very pretty effect can be obtained by judicious use of these. Cork is a very handy material for the formation of pockets and artificial rustic work, but it is not quite the right thing in the right place, being so impervious to moisture as to be apt to breed sourness in enclosed soil, and in course of time also woodlice find too much harbourage in it for the good of the installed plants. For hanging-baskets, galvanised, or better still, copper-wire frames filled with peat and moss, are the most natural-looking, if we may so speak of contrivances that are never found in Nature. Great care must, however, be exercised that these do not get dry, which, owing to their exposed position, is very likely to happen. A small porous pit embedded in the centre, corked and kept filled with water, is a great safeguard against a thorough drying out. These should not be suspended over other plants, but over the paths, since the drip from them is likely to damage the plants beneath. Should they become dry, they must be taken down and soaked, as all water supplied when once drought is established simply runs off or through, as if the basket were a duck's back.

Should vermin appear in the shape of aphids, thrips, white-fly or others of the tribe, we have found nothing so effectual for their extermination as Lethorion cones, which, moreover, do not appear to have the least detrimental effect upon the young foliage. Early in May is the time to look carefully for these pests, which by that time have generally all hatched from the previous season's eggs, and have not themselves reached the egg-laying stage. Hence, if wiped out at this time, they only reappear if re-imported. Aphides, as we know, propagate in a manner peculiar to themselves, and hence are somewhat outside our last remark as regards the eggs, though not entirely so; even these, however, succumb to Lethorion vapour *in toto*, and will not recur if the plants be healthy. *Chas. T. Druery, F.L.S.*

THE CAMPHOR TRADE OF CHINA.

A good deal of interest has of late been centred around the supply of Chinese camphor to the English market, in consequence of the demand exceeding the supply. We learn, however, from a recent report from Tamsin, that the export of camphor, which in 1890 amounted to only 7717 cwts., sprung in 1891 to 19,953 cwts. At one time the Hong Kong market went so low as to show a slight loss on every shipment, but the local firms continued buying, and were eventually rewarded for their perseverance by a rise in the market, which once more placed the camphor trade on a favourable footing. It experienced a more serious check, however, in the autumn, when an outbreak occurred among the savages, who, unable to distinguish between the Chinese caretakers of the camphor stoves, built with foreign capital, and their usual foes, attacked the Chinese generally, and destroyed numbers of stoves. Nothing could be done, the Chinese being quite unable to protect the stoves, or punish the savages; so one resident, who had considerable capital, invested in the business, boldly penetrated into the interior, at a time when the government troops and savages were at daggers drawn, and managed to make satisfactory arrangements about the balance of his money and stoves. What were destroyed will, doubtless, be a dead loss; but it is interesting, though not, perhaps, consoling to the losers, to see that a solitary foreigner can

safely venture, with a Chinese interpreter, into territory which the government troops do not dare to approach. If this rich and lovely island, most aptly named Formosa by the Portuguese, who probably knew much more about it than we do, were ever to fall into the hands of a civilised foreign power, there would be no difficulty in coming to friendly terms with the aborigines, who welcome a foreigner with the name of "brother."

The adventurous foreigner mentioned above, it is said, was not an Englishman, no British firm having as yet taken up the camphor trade.

THE CULTIVATION OF RICE IN CHINA.

In a report on the trade of Tamsin for the year 1891, the British Consul gives an interesting account of Rice planting. He says the hardest work is in the Rice fields. Two crops are sown and gathered in the year, harvest times being in the fifth and tenth months of the Chinese year, or about June and November. With such a short rest for the soil, heavy manuring is indispensable, and the neighbourhood of Paddy-fields at such a time is anything but desirable. From sunrise to sunset, the plodding native is busy, whatever the weather may be, ploughing up the fields with the assistance of the patient but hideous water-buffalo, and manuring them in readiness for the coming crop, which is meanwhile gradually springing up in little wet nurseries carefully sheltered from the north wind by straw screens. When the fields are sufficiently ploughed, irrigation has to be carried out, and a familiar sound at such times is the harsh squeak of the clumsy-looking but ingenious water-wheel, which is worked by the feet with revolving treads, on which the native walks, as it were, from one to the next, whilst he hangs with his arms over a horizontal bar, fixed at a convenient height. In this way, he pumps up water from a lower to a higher level, and when his day's work is done, walks home with his wheel over his shoulder.

The economy of the Chinese prompts them to make use of every little patch that is conveniently near a stream, and in such little patches, where there would be no possible room for the clumsy buffalo to get round with a plough, a most ingenious contrivance is adopted for breaking up the lumpy wet surface into a level smooth enough for transplanting. The labourer tramples all over the wet patch with huge wooden skates, as they might be called, but having four deep wooden blades instead of one; also, instead of fastening such heavy things to his feet, a long loop of rattan from the skates to his hands enables him to hold them tight to his feet, and thus equalise the labour of legs and arms. The result is all that can be wished. With regard to the transplanting, the rapidity with which this is carried out is wonderful. Little bundles of the young shoots are brought from the nurseries by boys to the men, who are standing up to their ankles in mud and water, and as many as twenty shoots can be planted in a minute, or at the rate of 1200 in an hour. The average rate is doubtless much less, but the rapidity and skill with which these men plant the shoots with the right hand only, the left holding the bundle of shoots, is marvellous.

After the transplanting, much remains to be done in the way of constantly clearing out weeds and other obstructions to growth, which is done almost entirely with the hand, the labourer either squatting or grovelling on his hands and knees in the deep mud. Finally, when the rice is fully grown, the water is drained off the fields, the grain quickly ripens, and the harvesting begins. In this, as in everything else, the procedure is primitive in the extreme. A large deep wooden tub is brought into the field, at one side of which is fixed a rude screen formed by three or four Bamboos, and a piece of as cheap sacking as can possibly be procured. A man standing in front of this tub thus screened receives bundles of the rice from the reapers, and holding a large double handful brings it down with a smart thwack inside the tub. This repeated once or twice

threshes out the grain, and the straw is thrown aside to be afterwards piled in straw stacks, that reminds one of the ricks at home. Thus, no threshing floors are used, but every farm-house has its smooth mud plastered floor, on which the rice is laid out to get thoroughly dried in the sun. When ready for the market the rice or paddy sells for an average price of 1 dol. 40 c.—or about 4s.—a picul of 133½ lb. avoirdupois. *J. R. Jackson, Kew.*

FLORISTS' FLOWERS.

DAHLIAS.

The Dahlia is easily damaged by wind, and the plants should be looked over weekly, and made secure, and such as are intended to produce exhibition blooms should be kept steadily growing, being kept moist at the root. It is good practice to mulch the soil first with decayed manure, and apply water afterwards. In hot dry weather the leaves should be kept clean with the garden engine. Earwigs must be caught before the flowers gain much size, or they will sadly mar their beauty; pieces of Bean stalks, or small flower-pots filled with hay, placed on the end of the Dahlia stakes, and emptied every day, will catch great numbers of these troublesome insects. The small and weak lateral shoots, which will not produce good blooms, should be cut off, and if these be cut through below a joint, and placed snugly in small pots, they will form roots readily in a frame with a mild bottom heat, as do Hollyhock cuttings at this season. When well rooted, repot into 48's, when they will form tubers by the end of the growing season. Exhibition Dahlias must have four or five stout sticks placed to the main side shoots; it is bad practice to tie these growths to one stake only, as they rock about sometimes, and get twisted and broken. Weak liquid manure water is beneficial after the flower buds are formed.

THE GLADIOLUS.

I have found that the fine garden varieties of *G. gandavensis* do best when the soil has been well exposed to the weather, it being not enough to trench it over late in the season—say October or November—and let it lay fallow. I recommend the trenching and manuring to be done in August, and the manure to be placed at least 6 inches below the surface. I place a layer of it at a depth of 18 inches, and another at 9 inches. Some persons may not care to have so long a fallow, but I believe the late M. Souchet, who established a world-wide reputation for himself by his success in raising new varieties of, and cultivating Gladiolus, used to let one portion of his ground lay fallow for an entire season, turning it over during the summer and winter, and keeping it free from weeds. Plants in growth should have sticks placed to them to prevent the wind snapping them off at the bulbs, or even throwing the plants out of the ground. Fertilise good flowers if seed-saving is practised. Seedlings from the March or April sowings will need but little attention this season if they are in the border, except a good watering in dry weather, as will the flowering plants, for no good spikes will be obtained, even from full-grown bulbs, unless they are sufficiently watered. Weak guano water is excellent for producing healthy deep green foliage and strong spikes. A species of green caterpillar sometimes lodges upon the spikes, and thrives amazingly upon the half-opened flowers; it can be caught feeding at night, or may be found safely enconced in the day-time in the axils of the leaves.

THE POLYANTHUS.

I have given up all hopes of successfully growing the finer named varieties of the laced Polyanthus in our dry district, it being impracticable to keep the leaves free from red-spider. It is easy enough to raise seedlings, and when a good strain has been obtained, some very fine varieties are produced. They must not be grown in juxta-position with the fancy varieties, the pollen from these seeming to be the more potent, and laced varieties, if crossed with the fancies, are spoiled, as you get a new class of bright-

coloured fancies; but that is not what is wanted. The young seedling plants of laced varieties and fancies have been planted out in the open border, and are growing freely, and need to be kept free from weeds by means of the Dutch hoe. A space of 12 inches between each plant is enough. *J. Douglas, Great Gearies, Ilford.*

THE CULTURE AND TRADE IN TOBACCO IN GERMANY.

REFERRING to the cultivation of and trade in tobacco, at Frankfort, during the year 1891, Consul-General Oppenheimer gives the following interesting facts:—"In July, in consequence of the wet mild weather, the young plants looked very healthy, and the accounts of them were very cheerful; but, on the rain continuing, and the thermometer falling, the plants stopped growing, and there were loud complaints. The price of old tobaccos rose, but that was no comfort to the peasant, as tobacco is rather an expensive crop to the grower. It takes a great deal out of the soil, which, consequently, requires to be very highly manured; and the labour in planting and keeping the field clean, is also considerable. At the beginning of August the plants looked worse still, and the first gatherings of the new crop, towards the end of the month, were very unsatisfactory. Happily, September was a beautiful, sunny month; the harvest was therefore postponed, and lasted on till the close, and the tobacco was plucked and hung in a good, dry condition. On being taken down and tested, the leaf, although deficient in colour, turned out to be of much better quality than had been anticipated. The prices paid by manufacturers and dealers to the villagers in Baden and the neighbouring lands varied considerably; but the whole crop was bought up in a comparatively very short time. Less tobacco had been planted, and the new leaf burnt well, and was of mild flavour. Germany cannot produce sufficient tobacco for its own constantly-increasing consumption. Nevertheless, the peasants in Baden and in the Palatinate complain that it hardly pays them now to grow Tobacco. They declare that the German leaf, which is subject to a government tax of £1 2s. 6d. per 100 kilos., cannot compete with the Java, Sumatra, and Brazilian tobaccos that are subject to an import duty of £4 5s. per 100 kilos., and demand that this tax shall be raised to £6 5s. per 100 kilos. while others propose that the German tobacco shall be relieved of all burdens. To make tobacco growing free would a radical measure, which is hardly likely to be carried out; the German governments, however, are solicitous for the welfare of the peasant growers, and so something will probably be done. It is, indeed, not easy, as with the increasing wealth of the country the demand is growing for cigars of better quality, and for such the Palatinate tobacco is unsuitable. For Baden the tobacco question is of considerable importance.

FOREIGN CORRESPONDENCE.

WASHINGTON, D.C., U.S.

August 15.—The heat here just now is very hard to bear, and one takes to fruit naturally as a palliative. . . . Scanning the *Gardeners' Chronicle* market lists—from Covent Garden to rejuvenated Farringdon—the other day, it struck me a few notes might not prove uninteresting. So far we have had few fruits here—only Blackberries (Brambles, as we call them at home). There are few Apples to be seen; the Peach is scarce; Pears are good, but I think they come from the South—they cost 1½d. each. Cabbages sell according to size—from 4d. to 6d. each. Grapes are always cheap here—carts go round when the fruit is in season—selling in boxes of 10 lb. at from 7½d. to 1s. per box. Potatoes fetch from 8s. to 12s. 6d. per barrel of about 3 bushels; but they charge me on delivery 4s. to 4s. 9d. per bushel. Onions sell at about 1½d. per lb. Of course, the supply affects the prices—thus Apples

can sometimes be bought as low as 6s. 3d., and again at not less than 12s. 6d. to 17s. per barrel, in the market here. Tomatos, native, 40 to 50 cents; Beans (white N.Y.), 7s. to 7s. 6d.; Lima Beans, 1½d. per lb.; Peaches (mountain), 8s. to 12s. per box; do., 2s. to 5s. per basket; do. Southern Clingstones, 3s. to 6s. 6d. per box. Plums, blue, 4d. to 5d. per quart; Water Melons, 32s. to 66s. per 100; Canteloupes, 4s. to 6s. per barrel. L. P.

SOUTHERN CALIFORNIAN NOTES.

To one unaccustomed to the various shades of yellow, gray, and brown of the dry hills and plains of Southern California, the aspect of Nature during the long dry summer is not pleasing, the lush and brilliant greens of the vegetation of lands where summer rains occur is wanting; to old residents, however, there is a charm about the summer that grows on one as residence in the country continues. The mornings are nearly always cool and fresh, and dews precipitated over night cause the various dry growths to exhale a delicious odour; the days are brilliant with ardent sunshine, and as the shadows of evening draw across the land, the rocky masses of the sierras assume rare tints of golden-brown and pink, deepening to richest purple.

With the advent of the winter rains, however, a rapid transformation takes place; innumerable grasses spring up within a week, and as early as the first week in February, many of our beautiful wildings are above-ground, and commencing to bloom; quantities of Calochortus, Dodocatheons, Eschscholtzias, and others, can be gathered in half-an-hour's walk from Los Angeles. Nearer the base of the sierras, however, the number of species increases greatly; several beautiful Pentstemons occur, and Mimulus, Phacelias, Nemophilas, and Delphiniums are particularly abundant; while among shrubs, the beautiful Ceanothus is almost ready to burst into bloom. Later on, the vast army of white and yellow Composites take the field, and in some places the superb *Romneya Coulterii* can be seen after May, with stems 10 to 15 feet in height covered with its splendid flowers.

Regarding operations in the garden, it may be interesting to some of your readers to refer briefly to climatic conditions which are highly favourable to horticultural work, always allowing that an ample water supply is at hand. The year is divided into the dry and wet seasons, which latter corresponds to the winter of the States lying east of the Rocky Mountains. The mean summer temperature is about 70°, with an extreme range of from 55° to 100°. Winter or the wet season has a mean temperature of 55°, with an extreme range of from 35° to 80°; these extremes occur but perhaps half a dozen times during the season. Generally the range during December and January is from 40° to 65°, while in low-lying places light frost occurs a few times. In summer the figures given above are not common, the temperature generally ranging from 65° at night to 85° during the warmest part of the day. It will be seen, therefore, that with water for summer use, gardening easily grows to be a passion with anyone fond of plants and flowers.

Already the Dutch Bulbs have come and gone, here and there a patch of Narcissus regales us with its fragrance, while Violets and Carnations are at their best, and Calla Lilies everywhere. Soon the Cape Bulbs will be in bloom; and, indeed, the sweet-scented Freesias are already commencing to blossom. A little later on we will have Ixias, Sparaxis, Babianas and Gladiolus, though the first three cannot be said to be common in gardens as yet. Cape bulbs find congenial conditions here, and I fancy there are few that cannot be grown in some situation about the garden. *Himantophyllum miniatum* grows and blooms finely in a partially shaded position, where the hot sunshine cannot reach its leaves. With the exception of a very few, we find the tropical bulbous plants succeed admirably. I have several *Pancreatums* and *Crinum*s, such as *C. amabile*, *C. pedunculatum*, *C. giganteum*, *C. americanum*, and some others, the names of which we would much like to know.

Several varieties of *Amaryllis*, *Zephyranthes*, *Vallotta*, and others are more or less common. Last year I planted out *Alpinia nutans*, and it now looks perfectly thrifty, and I hope to see it in flower this summer. In a few places can be seen some good plants of *Plumeria alba*, truly a tropical shrub, which flowers beautifully every summer. In a shady corner of our garden, we have fine plants of *Franciscea latifolia* and *Rogiera gratissima* in vigorous health, and covered with buds and panicles nearly ready to open; the latter we prize very highly, its perfume being so agreeable, while in full sun we have a grand old plant of *Tabernaemontana coronaria*, double-flowered variety, 5 feet high, with a trunk as thick as one's arm. Every summer it bears hundreds of its choice blooms. With *Ixoras*, however, "it is not to be," they gradually die away—perhaps the nights are not hot enough, or the air too dry.

Roses bloom more or less all the year, excepting, of course, the remountants; but you should see them during the early months of the year, the Teas and Noisettes especially, grand old Lamarques smothering the verandahs in bloom and foliage, patriarchs they are, with trunks 6 inches or more in diameter. In a few choice gardens a good many tropical plants can be seen, such as *Stephanotis*, *Bignonias*, and *Bougainvilleas*. In our own garden we have these and some others, notably *Schubertia grandiflora*, planted last spring as a small plant. Before autumn it had grown some 20 feet, flowering finely, and is now pushing its new growth; also *Aristolochia elegans* and *Stigmaphyllon ciliatum*. We have also a plant of *Quisqualis indica*, which wintered through nicely, though losing a good many of its leaves. I observed the other day, however, that it is already breaking away, and we hope to see it in flower this summer.

As I sit by the open window this sunny afternoon writing this letter to you, I occasionally raise my eyes from the work in hand, and look out upon a few plants now in bloom, notably a large mass of *Poinsettia*, brilliant with its scarlet bracts; nearer at hand drooping clusters of richest orange, the gifts of *Bignonia venusta*, hang gracefully from the eaves; some *Bouvardias* and the Chinese *Hibiscus* add further colour, but the enticing odours from Violets, Freesias, Daphne, and the delightful fragrance of the Olea, coupled with the spirited carolling of our regal songster, the mocking bird, in a large *Ficus* hard by, protest against further inside work. J. C. Harvey, Los Angeles, Cal., February.

NURSERY NOTES.

MR. E. C. GILBERT'S NURSERY, SPRINGFIELD, HASTINGS.

WHEN an exhibitor of stove and greenhouse plants is so very generally successful at flower shows, one is always desirous of ascertaining "how it is done," and with some such intent, the writer of the present note wended his way up the picturesque High Street of the Old Town, and out into the villa-lined hilly road leading to Orme. About half a mile from the end of the High Street stands Springfield Nursery, quite a small place, nestling in a fold of the ridge on the western side of the valley.

At the lower part of the ground evergreens, fit for furnishing window boxes and forecourts, &c., interspersed with a few trees, weeping, and others, were found.

The houses and offices are situated at the higher end of the piece of land, and are of all sizes, shapes, and aspects, just such structures, indeed, as an exhibitor requires. Here a small one for growing Heaths, there another, still smaller, where *Crotons* may be accommodated with the high degree of heat they require whilst growing, and an unshaded roof.

In another place or two we found some plants that may be said to have been damaged in the various contests they have engaged in—a hospital, in fact. Some of these old combatants looked much the worse for wear, and as if they would need a whole year to recruit their strength.

Some of the houses are utilised for retarding, some for wintering, some solely for accommodating plants whilst making active growth. This must be so where exhibiting is followed up as a business, apart

from the other occupations of the nurseryman; and those who have seen Mr. Gilbert's exhibition plants—his *Allamandas Wardleana* and *grandiflora*, the latter a beautiful flower of soft yellow colour; *Stephanotis grandiflora*; the *Ericas*, so capitally bloomed; *Tremandras*, *Bougainvillea glabra*, *Tree Ferns* and *Palms*, will bear witness to the skill with which they are cultivated, and brought to exhibitions at the right moment.

Large quantities of Tomatos, of a most prolific variety, were growing in some of the long span-roofed pits, in others were observed zonal *Pelargoniums* and general furnishing materials, for which there is a good demand in the town. Large pots or tubs of zonal *Pelargoniums* are much in favour, and such robust, fine trussed varieties as *Henri Jacoby*, *John Gibbons*, and *F. V. Raspail*, are those mostly grown. *Roses* and *Chrysanthemums*, in pots, for furnishing cut bloom were remarked in quantity, the latter being particularly robust, and well-furnished with foliage.

Another plant that is much in demand is *Coccoloba plumosa*. It is a species of Palm, of graceful appearance, tall and slender, doing well for a long time in quite small pots, and therefore very suitable as a furnishing plant. The first or seed leaf remains on the plant for four or five years, contrasting singularly with the true foliage, which is pinnate.

We understood that a nursery for nursery-stuff of larger growth had been established some few miles distant. We came away from the place with the notion that fine houses, the newest thing in hot-water piping, fads in ventilation, perfect flora and staging, were not absolute necessaries in the production of first-class exhibition plants, but that unremitting attention to the requirements of the plants at all seasons, the right kinds of soil, and good water, are the essential points.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

THE PINERY.—If a hotbed has been got in readiness, the suckers which are the strongest may be detached by twisting them from the old plants, their butt ends being cleared with a knife of the bruised tissues. Beyond this amount of preparation, only a few of the smaller leaves may be pulled off, so that the soil may come in immediate contact with the rootlets already formed about that point. The compost may consist of fibry yellow loam, to which a fair sprinkling of wood-ash and a bone manure may be added, and this soil should be placed in the Pine-stove or other warm place to be warmed before use. For the larger suckers 7-inch pots are suitable, a smaller size being employed for the small sizes, and these pots should be well-drained with crocks and rough siftings. If space can be afforded, it will be an advantage to allow most of the very small suckers to remain on the parent plant for some time longer, growth being then quicker than when they are detached at that early stage. Put the potted suckers low down in the soil, making it firm about them with a rammer; plunging the pots up to their rims in the hotbed, affording a thin shade during sunny days, giving less and less as the autumn advances, and maintaining a humid atmosphere in the structure.

VINES.—Vines which were forced early should have the lateral growths cut back to within 1 foot of the main rods, so as to concentrate the remaining efforts of the Vine in plumping up the buds that will be next year's fruit producers. All Vines which have been allowed to extend their lateral shoots unrestrained are most benefited by this course of treatment, and it is for those who may have adopted this method of Vine culture that these remarks are intended. As moisture at the root of the Vine is indispensable at all times, see that the borders do not lack this factor, and when it becomes necessary to afford water, some kind of suitable manure should be applied at the same time. Late Vines, too, will most likely stand in need of watering, the drying days we have had lately having materially exhausted the supplies of moisture in the soil. The hours of the early morning of a day that is likely to be sunny should be chosen for this job, so that the surface of the soil may get dry before night; at the same time, a brisk warmth should be kept up in the heating apparatus, and the ventilators kept wide open. The lateral growths of late Vines should be shortened whenever a bunch of Grapes is removed.

CUCUMBER SEEDS may now be sown of some good and prolific varieties for the winter and spring supply. I have found Tender and True good for this purpose, but I intend to try a seedling from it which bears an excellent character as regards hardiness and free-fruited properties.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

CABBAGES AND COLEWORTS.—A good breadth of the strongest plants of the first-named, if planted now, will afford Cabbages in December. The plants should be put out in rows at 18 inches apart, and half that distance, or less space, from plant to plant.

COLEWORTS.—The Hardy Green variety may be planted rather close together for early spring cutting. They will thus come into use before the autumn-sown Cabbages, and often prove of great service after severe winters.

TURNIPS—Seed for the autumn and early winter supply of Turnips will have already been sown about one month ago; but a sowing may now be made of Golden Ball and Chirk Castle varieties. The sowing should be made on land in good heart—a piece just cleared of Potatoes would suit them admirably, and would need merely to be cleaned and raked over before sowing it; and if it be light land, Turnips may be obtained from this sowing all through the winter, and where Turnip-tops are consumed in the spring-time, these roots will afford a supply. A quick growth in the Turnip may be secured by sowing the seed in moist weather, and keeping the soil moist till the true leaf appears, and by sprinkling fish-manure or guano between the rows just before rain.

SPINACH.—If seeds of the Improved Round-seeded Spinach be sown at the present time, some useful produce may be secured when the earlier variety, which, owing to the size of the leaves, is more affected by hard frost, affords but little. This late sowing is generally to be trusted to furnish leaves fit for consumption even in the severest winter. The drills need not be more than 15 inches apart, and care should be taken not to sow on land which is infested with the grub or wireworm.

EARLY POTATOS.—Those left to mature for planting purposes may now be lifted, sorted, and placed on a dry border on boards, &c., to become green. The Ashleaf varieties will all be ready for digging at this date, as will many of the second earlies, and nothing is gained by leaving the tubers in the earth after the tops have decayed. Take care that every tuber, however small, is collected when digging them up, otherwise it is almost an impossibility to keep the stocks pure.

MUSHROOMS.—If manure has been prepared, the present is a good time to begin the making of beds in the house. If woodlice or beetles abound in the house, use dilute carbolic acid about the floors and shelves, and limewash the walls. Materials for later beds may be prepared, a new bed being made each month to maintain a constant supply of Mushrooms. When a large quantity of Mushrooms is required in a short space of time, the production may be hastened by inserting some spawn taken from beds in good bearing, taking care to have the beds at the proper temperature. Exhausted beds may sometimes have their fertility revived by watering them with warm liquid manure from the cowyard, or by watering with very weak salt water.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

CYCLAMEN.—One and two-year-old plants, which have been stood out in the open, or in cold frames, and are starting into growth, should now be repotted. Use two parts of rich fibrous loam, one of decayed cow manure, and one of leaf soil, with sand in proportion, and remove all the old soil from around the corms; any pots into which the corms can be conveniently placed will be large enough for a time. After repotting, it is much safer to place them in a cold frame, than allow them to remain in the open, on account of heavy rains, which cause the soil to become saturated, and the plants to become stunted.

PROPAGATION.—Seeds may now be sown, using finely-sifted soil, consisting of two parts loam and one of leaf-soil, and sand in proportion. Sow the seeds evenly over the surface, afterwards covering them with about a quarter of an inch of soil. The pans should then have a piece of glass placed over them, on which put a little damp moss to prevent the soil from drying up too quickly; place the pans in a

structure where the night temperature is not allowed to fall below 65°.

WINTER-BLOOMING SOFT-WOODED PLANTS.—Such plants as *Salvias*, *Solanums*, &c., which have been planted out in the open, should now have their roots cut round, so as to prepare them for lifting, and if this operation is performed again in the course of a fortnight's time, the plants will not receive much check.

WINTER-FLOWERING CARNATIONS.—Plants of these which have been planted out in the open, should now be lifted and potted up, if it is intended for them to bloom during the winter. The operation should be executed with great care, so that the roots may not be unnecessarily injured. Any that have been in pots during the summer, and have filled the same with roots, may now have a little assistance given them in the shape of weak manure-water. In cases where the stock for next year is deficient, a batch of cuttings may still be put in, placing them on a gentle hot-bed, where the bottom-heat can be maintained until they have struck root, and by no means try to strike them in a cold frame at this season, as it is sure to end in failure.

CELOSIA PYRAMIDALIS.—Plants raised from seed sown late, to furnish plants to bloom during late autumn, should be moved into pots in which it is intended for them to bloom, 6 or 7-inch will be found large enough, as a great deal may be done in the way of giving the plant the required strength, by applying weak manure water; also syringe the foliage freely when closing the ventilators in the afternoon, as a preventive against red spider, which is very partial to these plants.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

THE FLOWER BEDS.—The heavy rains of late did damage to the plants and beat the flowers to pieces. Carpet-bedding was also affected by the deluge of rain, when they were so bright and gay. However, should we again be favoured with fine weather, all the beds will become bright and attractive once more. In the meantime, all damaged flower-trusses and dead and withered leaves must be removed speedily, the lawn and gravel walks swept and rolled, and everything that tends to tidiness performed with all speed. The flowers of *Cineraria maritima* and other foliage plants must be removed as fast as they appear on the plants, and the shoots of *Perilla nankinensis* and *Iresines* should be pinched back and pegged to the earth as occasion arises. Beds of *Verbena*, *Petunia*, *Gaillardia*, *Phlox Drummondii*, and the like will require to be rendered symmetrical by pruning rampant growth and thinning the shoots, so as to enable the flowers to be seen to advantage. Trimmings of *Mesembryanthemum*, *Alternanthera*, variegated *Alyssum*, *Gnaphalium*, *Pelargonium*, and *Verbenas* may be used for increase, putting the cuttings rather thickly together in well-drained 6-inch pots, filled with light soil, and having a surfacing of silver sand. Stand the pots closely together on a worm-proof bottom in a pit or frame, and near to the glass, affording water through a fine rose to settle the soil. Keep the frame close, and shade the cuttings from the sun till roots form.

HERBACEOUS PLANTS.—These, too, bear evidence of the recent rough weather, and the removal of broken shoots and stems, and the securing of the plants to their supports should have early attention. *Michaelmas Daisies*, *Phloxes*, perennial *Sunflowers*, and *Anemone japonica*, are good wet weather flowers, and the rain has hurt them but little. The same may be said of the *Montbretias*, which, with their pretty grass-like foliage, and branching spikes of bright yellow, orange, and scarlet flowers, are very effective, either as cut flowers, or growing in clumps in the borders.

ROSES.—Remove root-suckers from worked plants as soon as they can be handled, also spent blooms, so as to throw the strength of the plants into the later blooms.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

Those intending to plant fruit trees extensively in the coming autumn, providing the land is at liberty, should set about the work at once, and get the ground thoroughly prepared, and in good order for the reception of the young trees and bushes, so that the planting may be pushed forward as early as possible after it is safe to lift the roots, because the earlier the trees are planted the better chance will they have. Fruit trees should always be planted

on well-drained land, with a fairly good depth of loam. If possible, it should be well trenched up, or worked thoroughly with the steam cultivator sufficiently deep to break up the hard bottom. Before planting-time arrives, particular attention should be paid as to the best and most suitable sorts for the various purposes, and a visit to some of the large nurseries or large orchards in full bearing will materially assist the planter in his selection. Of Apples, Lord Derby, Lord Grosvenor, Red Hawthornden, Eckinville, Worcester Pearmain, Lane's Prince Albert, Fillbasket, Tower of Glamis, Golden Spire, New Hawthornden, Stone's Stirling Castle, Cox's Pomona, Altriston, Bismarck, Summer Golden Pippin, Pott's Seedling, Bramley Seedling, Warner's King, Wellington, Northern Greening, Cox's Orange, and Gladstone are all good and satisfactory croppers; so are King of the Pippins and Golden Knob.

MORELLO CHERRIES.—With careful netting for keeping out birds, these fruits will hang and keep in good condition a long time after they are ripe, but so soon as they are gathered, the foliage should be thoroughly syringed with weak Gishurst compound, or soap-suds, and should the foliage be black, a wineglassful of petroleum added, and thoroughly well mixed, will in a great measure remove it, leaving the leaves bright and healthy. All trees from which the fruits have been gathered, and are infested with scale, may be washed repeatedly with petroleum and soapy-water, at the rate of a wineglassful to 4 gallons of water, keeping the contents well mixed together as it is being used. It is better to be on the safe side when using insecticides, and to do the trees over a few times in preference to one or two heavy dressings.

FIGS.—These should be gone over once more, and all the soft useless shoots trimmed off; light and air being essential to well-flavoured fruits. Some of the points of shoots bearing much fruit may be nipped out to hasten ripening; but at intervals all over the trees, some should be laid in at full length to fruit next year, while shortening should not be practised on short-jointed wood that usually ripen and produce good crops of fruit. In narrow restricted borders, the roots may require further attention with regard to water and nourishment.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

SEEDLING ORCHIDS.—Young seedling *Cattleyas*, *Dendrobiums*, and *Cypripediums* are best pricked off into thimbles (1-inch pots) as soon after germination as it can safely be done. I prefer to do so when the first tiny leaf is made, as during further growth of the pseudobulb new roots are emitted into fresh, clean material. These small seed-pots should be half-filled with crocks, then filled to the rim with chopped sphagnum-moss, best fibrous peat, and sharp silver-sand, mixed well together, and made rather firm. I then generally press down the compost all round by means of a pointed stick close to the rim of the pot, so as to leave a slight ridge just deep enough to steady the half-dozen small seedlings, which I place in it on the point of the stick; the compost should be well watered previous to receiving the seedlings, after which the watering is a delicate operation, and must be done with great care until the little plants are steadied by their own roots. It is best to place a number of the small pots containing seedlings into a shallow pan containing sphagnum moss, and suspend them near the glass, but well shaded from the sun. If the sphagnum moss be kept wet, it will greatly assist the young seedlings by keeping them cool and moist. In the case of *Cattleyas* and *Cypripediums*, this transplanting may be safely done now; but I would not advise the removal of *Dendrobiums*, *Calanthes*, *Thunias*, and the like after this date, but rather let them rest with the plant on which they were sown, which is usually a *Dendrobium*, and pricked off when growth commences in the spring.

THE CATTLEYA-HOUSE.—*Laelia elegans* and its varieties grow best if suspended in baskets or pans near the light; the typical variety frequently makes two pseudobulbs, and flowers twice during the year. *Laelia elegans prasiata* is one of the most beautiful of the type, and is now in flower; the sepals and petals are of a beautiful dark rose colour, the lip round the column pure white, tipped with crimson, and the disc of the lip deep magenta. *L. e. Turneri* is another beautiful variety, being the darkest-coloured of all. A few plants of *Cattleya Leopoldi* are serviceable for flowering at this season, and grow well in this house, as do also the new *Cattleyas Victoria Regina* and *C. Alexandra*, of which we know but little at present.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

TUESDAY	SEPT. 6.	Royal Horticultural Society: Committee Meetings, at the Drill Hall, James Street, Westminster.
WEDNESDAY,	SEPT. 7.	Royal Caledonian Society, Edinburgh (two days).
THURSDAY,	SEPT. 8.	Paisley Horticultural (two days).
FRIDAY,	SEPT. 9.	Earl's Court Exhibition: Show of Autumn Flowers.

MEETING.

FRIDAY, SEPT. 9.—Dundee Horticultural Association.

SALES

MONDAY,	SEPT. 5.	Dutch Bulbs at Protheroe & Morris' Rooms, at 12 o'Clock. Dutch Bulbs at Stevens' Rooms.
TUESDAY,	SEPT. 6.	Dutch Bulbs at Protheroe & Morris' Rooms, at 12 o'Clock. Clearance Sale of Horses, Carts, &c., at Steell's Nurseries, Kew Road, Richmond, by Protheroe & Morris, at 2 o'Clock.
WEDNESDAY,	SEPT. 7.	Dutch Bulbs at Protheroe & Morris' Rooms, at 12 o'Clock. Dutch Bulbs, Crocuses, &c., at Stevens' Rooms.
THURSDAY,	SEPT. 8.	Dutch Bulbs at Protheroe & Morris' Rooms, at 12 o'Clock. Dutch Bulbs, Crocus, &c., at Stevens' Rooms.
FRIDAY,	SEPT. 9.	Dutch Bulbs at Protheroe & Morris' Rooms, at 12 o'Clock. Unreserved Sale of a valuable Collection of Established Orchids, at Protheroe and Morris' Rooms, at half-past 12 o'Clock.
SATURDAY,	SEPT. 10.	Dutch Bulbs at Protheroe & Morris' Rooms, at 12 o'Clock.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—59°1.

The National Co-operative Flower Show at the Crystal Palace.

THOUGH the black Friday of the 19th ult. did its worst to throw a wet blanket over this annual festival of labour, the shadows vanished on the following morning, when from 30,000 to 40,000 visitors, mostly devotees of horticulture or members of friendly societies, or co-operative, profit-sharing enterprises visited the show. Year by year the entries become more numerous, and what is higher proof of success, the quality of what is shown improves. Exhibitors are gradually learning, not only to grow flowers, fruits, and vegetables, but to appreciate to what perfection others can and do grow them. Example here as elsewhere, that is, object-teaching, has proved its power, and pulls up the ignorant and the laggard to a high level of excellence. True, there have been a few failures. But even these have proved potent to raise the level of industrial cultivators to a more uniform excellence. Inferior samples of sorts or of cultivation are gradually disappearing from these great National Co-operative Flower Shows.

At some of the earlier shows, experts often longed to hide half the exhibits staged under the tables. Now, there is scarcely one shown that is not worthy of its place, though from the fact of its being one in a large number of

fifty lots shown for three, four, or more prizes in a class—it cannot always command a prize. This will be still more obvious when it is stated that 300 tables, extending to a total length of half a mile, were filled to repletion with the products of over 300 exhibitors.

These exhibits came from all quarters of the United Kingdom. For the purposes of this show, the latter was divided into eight districts, as follows:—

Class 1.—Northern District.

Class 2.—North-Western District.

Class 3.—Midland and Eastern Districts.

FIG. 47.—NEMESIA CYNANCHIFOLIA. (SEE P. 269.)

Class 4.—Metropolitan District, within a radius of thirteen miles of Charing-Cross.

Class 5.—Southern District: counties of Essex, Hertford, Bedford, Buckingham, Berks, and Oxford.

Class 6.—Southern District, No. 2: counties of Surrey, Sussex, Kent, Hants, Wilts, and Isle of Wight.

Class 7.—Western District.

Class 8.—Scotland and Ireland. The wide geographical range here indicated accounts for a great variety of quality though the difference from this cause is less pronounced than might have been expected, toil and skill being far more influential in originating or developing quality than geographical position. So far as

we know, the promoters of this show have been the first to offer special prizes for special classes and districts; and this particular feature of their programme deserves more support than it has yet received.

We understand that difficulties as to speed and cost of transit place obstacles in the way of a wider competition for these geographical prizes. But, surely, most railway directors would gladly remove such difficulties once a year in favour of the industrial exhibitors at the National Co-operative Flower Show.

Last year, if we remember rightly, one of the finest exhibits came from Aberdeen. This year Scotland and Ireland had but one indifferent exhibit between them. The other divisions ranged from three to eight exhibits each of six varieties of vegetables, neatly arranged. The metropolitan district had seven collections, all good, some specially so; and, with the exception of the absence of the milky whiteness that distinguished the provincial Cauliflowers, few could have told that these collections of fine crisp-looking vegetables had all been grown within 15 miles of Charing Cross.

Partly through the weather of the previous day, more, perhaps, through the lateness of the season, the number of exhibits hardly equalled those of 1891. But the extraordinary advance in quality of the show of this year carried it ahead of all that had preceded it. In the fruit and vegetable classes, one might have counted the inferior exhibits on the fingers of one hand. There were two of Carrots, one of red Currants, and one of Onions. The latter were a lot of five of the finest Onions in the show, with one more, a monster, with a large decayed spot on one side. Another lot consisted of five perfect Turnips instead of six, and which could not be made into six by the search of the jurors, police, and others. We name these facts for two reasons—to give emphasis to the general perfection of the 4000 exhibits, and, for the hundredth time, to remind those not much accustomed to exhibiting, on what small things success or failure in the winning of prizes may depend.

Progress was even more marked in the classes for the development of beauty than for the growth of utility. The Fuchsias, Begonias, Lobelias, and Stocks, have made great progress. Among cut flowers, Roses at this great show have advanced from very indifferent specimens indeed to almost first places at the National or other shows. Taste has also more than kept pace with culture. The baskets of Roses, bouquets, vases, epergnes, &c., all attest to the rapid growth of more cultured taste.

But the main obstacle in the way of the more perfect artistic arrangement in flowers, and groups of plants likewise, not only at the Co-operative Flower Show, but in most other places, lies in the excess of material and of colour. The toning down of glare, and breaking up of tiresome monotony should be effected through the use of a greater quantity and larger variety of verdure. The Swanley College made a brave display of its manifold products, and especially its preserved fruits, in many forms.

FUNGUS FORAY.—The hundredth meeting of the Yorkshire Naturalist's Union will be held on Wednesday and Thursday, September 14 and 15, and in a great measure will be devoted to a fungus foray in the charming district of Castle Howard. Dr. M. C. COOKE and Mr. G. MASSEE, of Kew, have consented to be present, and mycologists from other parts of Britain will be cordially welcome. The secretary, Mr. W. D. ROEBUCK, Suony Bank, Leeds, will be glad to supply particulars.

FIG. 48.—NEMESIA STRUMOSA. (SEE P. 269.)

HYBRID BETWEEN BLACK CURRANT AND GOOSEBERRY.—Mr. CULVERWELL has kindly sent us a fruiting specimen of this curious hybrid. "You will see," says Mr. CULVERWELL, "that the fruit resembles the Currant in the 'banging,' but the leaves are like those of the Gooseberry." Mr. ARTHUR SUTTON, who has seen the bush, says that "the bush looks like a Gooseberry bush, with Currant-like leaves, and the fruits are like small Gooseberries in bunches of two, three, or four, on one stalk." The general character of the hybrid is sufficiently shown in the accompanying illustration (fig. 46). The artist, however, has omitted to show what is obvious enough in the specimens before us, the racemose character of the inflorescences, which are borne on spurs from the old wood as in the Gooseberry and which gave to the plant more of the general appearance of the Black Currant than is here shown, and he has likewise omitted the hairs by which the fruit was covered. We append some notes taken from the fresh specimens, and showing the differences in the shoots and foliage of the hybrid and of the Gooseberry and Currant:—

Gooseberry.—Rind of young wood, ash-grey, spiny; leaf-stalk slightly dilated at the base, with a few coarse hairs; blade without glands, cordate at the base, lobes widely spreading, disc 3-nerved, orbicular, 3-lobed, lobes nearly equal, crenate, narrowed at the base.

Black Currant.—Rind of young wood, pale fawn-coloured, smooth, without spines; leaf-stalk much dilated at the base, with a few coarse hairs and glands, blade with a few yellow glands on the under-surface, cordate at the base, 5-nerved, basal lobes rounded less widely divergent than in the Gooseberry; disc broadly ovate acute, 3-lobed, lobes ovate, slightly narrowed at the base, crenate, dentate, central lobe larger and wider than the side-lobes, narrowed at the base.

Hybrid.—Rind of young wood, fawn-coloured, becoming ultimately smoky-brown and cracked, without apices, leaf-stalk only slightly dilated at the base, and with a few hairs; blade destitute of glands, lighter in colour than in the Gooseberry, oblong-ovate or roundish, base scarcely cordate, or, in most cases, wedge-shaped; disc 3-lobed nearly to the centre, lobes broad at the base, crenate, dentate, central lobe scarcely narrowed at the base, slightly larger than the side-lobes.

The fruits of the hybrid were of the size of black Currants, but in colour like a red Gooseberry, beset with fine hairs, and destitute of seeds. The flavour partook of that of the Gooseberry mixed with that of the black Currant, an improvement on both, as it seemed to us. If Mr. CULVERWELL can succeed, as he seems likely to do, in growing Gooseberries in clusters of an improved flavour, and with no spines he will be a benefactor to his race.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Society will take place in the Drill Hall on Tuesday, September 6; and at 3 P.M. a paper on "Root Pruning" will be read by Mr. G. BUNYARD, which ought to evoke some discussion among gardeners.

GLADIOLI.—Amateur growers of these plants ought to be in force on the above occasion, as the Council have offered substantial prizes to the best-grown varieties, as have also Messrs. KELWAY for the best British-raised forms of *Gladiolus gandavensis*.

TORQUAY DISTRICT GARDENERS' ASSOCIATION.—We have to record the formation recently, in Torquay, of an association of gardeners and friends of horticulture, under the presidency of Mr. W. LAVERS, and with Mr. F. C. SMALL, 1, Knowsley Avenue Road, Torquay, as Hon. Secretary. The aim of the Association will be the mutual instruction of its members by meeting together at stated times to read original papers or essays on subjects of interest to the gardening profession, to discuss the same, and, in any similar way to promote the welfare and improvement of gardeners.

THE VEGETATION OF MARS.—There is a story to the effect that a local editor, much depressed by a continued absence of sensational news, begged his

reporter to "go and kill something." If the editors of the London dailies do not go quite so far as this, they certainly carry out the theory by starting, in the dull season, some more or less idiotic subject, on which a great many people, with more time on their hands than brains in their heads, avail themselves of saying something in print. These sort of discussions lead nowhere and end in nothing, partly because scarcely two individuals agree on any one point. This season, however, a matter of very great and universal interest has, for a wonder, been "taken up" by newspapers, the planet Mars, to wit. A good deal of nonsense has been written and printed, even on this abstruse topic, and many of these gross exaggerations have just been pointed out by Mr. W. E. PLUMMER, astronomer to the Mersey Docks. From this gentleman's letter to the press, we extract a paragraph relative to the colour of the leaves of the trees in Mars. He says:—"The dim veil which has been described as sometimes hiding restricted areas on Mars, is directly traceable to the presence of clouds in the Martian atmosphere, and, however plausible such a suggestion may seem, and which would very fairly explain the appearances which certain astronomers of repute have observed, it does not seem quite so warrantable to conjecture that these clouds are collected in order to scatter a beneficent moisture over a red vegetation. Many may refuse to receive this explanation of the red colour of the planet by supposing that it is due to red foliage; but there is much the same proof or absence of proof for this last suggestion as for those others which more readily commended themselves to our judgment. Perhaps the suggestion that the formations which have been compared to 'canals' are required for the purposes of commerce is not intended to be taken seriously, or that at a time when these 'canals' were thought to be double, it was the result of engineering processes undertaken on Mars to facilitate commercial enterprise, or to attract the attention of the denizens of this planet. But the joke, if joke it be, would not be warranted unless this way had been paved by loose assertion and fanciful speculations."

NARCISSUS GROWING AT SCILLY.—In the Islands of Scilly it is not a rare sight to see hundreds of thousands of beautiful Narcissi in bloom in the field in February and March months, and the Narcissi crop now takes precedence of the Potato. Many who grew Potatoes largely a few years ago, now grow none at all. One grower, Mr. FRANCIS WATTS, will have under cultivation this season 20 acres of Narcissi alone, comprising over one hundred varieties, at prices varying from 20s. to £30 or £40 per 1000.

A FLOWER SHOW IN BETHNAL GREEN.—A flower show in Bethnal Green recalls something of the Palace of Delight, to which Mr. WALTER BESANT refers in his *All Sorts and Conditions of Men*. Time was when Bethnal Green was a delightful village, with florists' gardens by the side of green lanes; but where RAWLINS and others once grew Dahlias and other florists' flowers, there are lines of streets and a dense population, and all traces of country life have disappeared. Bethnal Green abounds with carpenters, cabinet-makers, and other handicraftsmen, and in 1891, a few of these having in their hearts a love for flowers, formed what is known as the East London Amateur Floricultural Society, the main object sought being the extension of the cultivation and love of flowers in East London. The operations of the Society are confined to within 3 miles of the Bethnal Green Museum; but the main of the plants and flowers are drawn from dwellings near to the Museum. The Society has now fifty members, who subscribe 2s. 6d. annually; and a summer exhibition takes place in August, and one for Chrysanthemums in November. The Oxford Mission in Bethnal Green allow the use of the Oxford Hall, which is just behind the Museum, for the exhibition, and the summer one took place on the 22nd ult. What astonished one was the quality of the plants largely grown in small and homely structures erected in meagre back

yards, with the walls of houses frowning upon them around. Groups of plants comprised Cannas, Plumbago capensis and its white variety, Fuchsias, zonal Pelargoniums, Begonias of the metallica type, Gloxinias, Ferns, succulents, Liliun auratum, and Liliun speciosum. Several groups were shown, the principal prizes being the Bronze Medal of the Royal Horticultural Society, and there was a great desire to obtain it; the winner was Mr. RONSON, a carpenter, living near to Cambridge Heath Station; the 2nd prize going to Mr. RANSOM, Stepney, a dock labourer, and the 2nd ran the 1st very close. Three remarkably good zonal Pelargoniums were shown by Mr. BASS, a Potato dealer, of Green Street, who has to cultivate his plants in a very dark back yard; and a collection of six plants was shown by the dock labourer, who put up a little greenhouse, and finds in it much pleasant recreation during the enforced hours of leisure. Coleus, Fuchsias, Cannas, and such like, were very good, regard being had to the conditions under which many of the plants are grown. Some well grown and flowered double Petunias were shown by Mr. RICHARDS, a cabinet-maker, who has the advantage of dwelling near the Victoria Park. A brace of capital Cucumbers was shown by Mr. BONE, a boot-maker, who has a small arrangement in glass, heated by means of a hot-water pipe from the kitchen boiler. A model garden, shown by a Mr. PYNE, the master of the National School, Peel Grove, Bethnal Green, some 4 feet or so square, was an admirable product, worked out by means of tiny plants of various kinds, all rooted, and some in flower. It received a prize of 8s., but was well worthy the Silver Medal of the Royal Horticultural Society. Some capital Tomatos were shown, grown and ripened in the Seawardstone Road. Here was an exhibition full of human interest, and could it be multiplied a thousand times in the more crowded parts of London, the social benefits conferred would be of the greatest value. No recipient of a Medal of the Royal Horticultural Society ever before gained it with so much of joy and thankfulness as did the carpenter RONSON, of Cambridge Heath, at Bethnal Green on the 22nd ult.

MELON-CUCUMBER.—Mr. BARRON sends us a portion of the bine of a Cucumber bearing, in addition to young fruits of a Cucumber, another of the size of a turkey's egg or rather larger, and of an ovoid shape, like a Melon. A similar case was figured in our columns in 1873, p. 1335. The facilities for cross-breeding in Cucurbits are so great, that we are not surprised to meet with great variations; but in this particular instance the change, for reasons to be presently assigned, is not likely to be due to any cross-breeding, but to some other unknown cause of variation. The young Cucumbers are studded with small prickly hairs (white spine), while the Melon-like fruit is destitute of such appendages. The outer rind, however, consequent on the rapid swelling of the tissues in the interior, is cracked and covered with chaffy scales of dead epiderm, almost as in a netted Melon. Under ordinary circumstances, Melons and Cucumbers are sufficiently distinct; nevertheless, they present so many points of similarity, that it would not be unreasonable to suppose that they might have descended from a common ancestor. In Numbers, xi., 5, we find in our translation the two mentioned separately:—"We remember the fish which we did eat in Egypt freely, the Cucumbers and the Melons, and the Leeks and the Onions and the Garlic;" but it would be very hazardous to suppose that the words used had the same precise signification then as now. That something of the Gourd kind was meant is all that we can assert definitely. HEHN, in his *Wanderings of Plants and Animals*, shows that the earlier references apply to Gourds of some kind rather than to Melons proper, evidences of which, according to him, are not forthcoming of earlier date than the later period of the Roman Empire. As specially bearing on the fruit sent us by Mr. BARRON, we quote the following passage from HEHN:—"PLINY relates that in Campania there arose accidentally a Cucumber of the

nature and golden colour of the Quince, which was then propagated by sowing the seeds; that the wonderful thing about these 'Melo-pepones,' besides their shape and odour, was, that as soon as they were ripe they detached themselves from the stalk. Here, for the first time, we hear of the odour of this fruit; its Greek name, from *melon*, Quince, originated in Grecian Campania; and afterwards, when the fruit became generally known, was popularly shortened into melo. No one will believe that the Melon was produced from the Cucumber in Campania by a freak of Nature." With reference to this latter statement, we own we see nothing unreasonable in the supposition that the Melon might have so originated—quite the contrary. "Freaks of Nature" are things the actuality of which we do not believe in. It is simply a phrase meaning that "we do not know" how a particular result has been attained. That there is anything like caprice or freak in the works of Nature is inconceivable by a naturalist. M. NAUDIN, whose practical researches into the natural history of these plants are of far more value than *à priori* speculations, declares, as the result of his experiments, that the Cucumber and the Melon belong to distinct species, and cannot be made to intercross. While the origin of the Melon is a matter of conjecture, that of the Cucumber is more distinctly traced to some Indian species like *C. Hardwickii*, a plant growing wild in Kumaon and Sikkim. M. COGNIAUX, the latest monographer of the Cucurbitaceae, like NAUDIN, keeps the Melon (*Cucumis melo*) and the Cucumber (*Cucumis sativus*) as distinct species. In his analytical *Conspectus Specierum* (of course, avowedly only an artificial guide to the student), M. COGNIAUX divides the species into those which have a smooth or downy fruit, in which he classes *C. melo*, and those which have a spiny or tubercled fruit, under which latter he classes the Cucumber. Were the learned botanist to visit a show of vegetables nowadays, he would find far more smooth than spiny Cucumbers; so that, judging from that point alone, most of the Cucumbers of the present day would fall in the same category with the Melon!

THE LATE PROFESSOR JAMESON.—We have already called the attention of our readers to the sad case of Miss JAMESON, as detailed in the letter of the British Minister at Quito, forwarded to us from the Royal Gardens, Kew (see p. 218). An interesting account of the career of the late Professor, from the pen of the late Mr. ANDERSON HENRY, will be found in our pages, December 7, 1872. JAMESON, after graduating in Edinburgh, went to Ballin's Bay as a surgeon in a whaling vessel, and returning thence, proceeded, in 1820, to South America in an old smack, the management of which he had eventually to undertake himself from the incapacity of the skipper. Afterwards we hear of JAMESON at Lima and at Guayaquil, at which latter place he practised as a physician, but, contracting fever, he was advised to betake himself to Quito in 1826. In this city, 10,000 feet above the sea, he resided forty-four years, being appointed Professor of Botany and of Chemistry in the University, and in 1832 Assayer of the Mint. Had Mr. WHYMPER recollected the fact that JAMESON was a Professor of Chemistry as well as of Botany, he would not, in his *Travels amongst the Great Andes*, have indulged in the sarcasm as to the appropriateness of appointing a botanist as Master of the Mint. JAMESON'S *Synopsis Plantarum Equatorensium* was published in 1864 in an unpretending form, but one which rendered it available for the generality of botanists and of travellers, which is more than can be said for the costly and bulky publications sometimes issued under Government auspices. In 1872, Dr. JAMESON revisited his native land, and, returning to South America, again contracted fever at Guayaquil, from the effects of which he died in 1873. JAMESON was the correspondent of the HOOKERS, LINDLEY, indeed, most of the botanists of his time. Many plants were introduced by him through the late Mr. ANDERSON HENRY. To show how the labours of Dr. JAMESON are appre-

ciated by those best qualified to judge, we append a translation of a letter received from our distinguished colleague, M. ED. ANDRÉ:—

"The last number of the *Gardeners' Chronicle*, p. 218, contains an urgent appeal from the British Minister at Quito to the active sympathy of all who knew Professor JAMESON, of Quito. One of his daughters, whom I had the pleasure of seeing at Quito, is at present reduced to the direst poverty. Few botanists and horticulturists [of the present generation] are aware of the services rendered to Botany by Professor JAMESON. Not content with having explored a large portion of the Equatorial Andes, and to have largely contributed to our knowledge of the Flora of those regions, he never ceased sending living plants from gardens and hothouses. If reference be made to the volumes of the *Botanical Magazine* from 1840 to 1860, the portraits of numbers of plants introduced by him will be found. His daughters have always led a most honourable life, and as fortune has not befriended them, I take it to be the duty of all those who are interested in the doings of the true friends of Botany to come to the assistance of Miss JAMESON. Allow me to be among the first to send you my modest offering, &c. Ed. André."

This letter of M. ANDRÉ'S is peculiarly grateful to Englishmen, not only as a mark of sympathy for the unfortunate, but as a token that the bonds of science are not confined within the limits of any particular nationality. We shall be pleased to transmit to the proper quarter the contributions of those who may be disposed to follow the generous example of the editor of the *Revue Horticole*.

THE WEATHER.—The recent rains which visited the southern parts of England must have been of inestimable benefit in refreshing the flagging vegetation in parks, orchards, and gardens. Timber trees were rapidly getting thin in foliage, and showing signs of autumn six weeks in advance of the usual time. One of our contemporaries ascribes this early defoliation to the airlessness of the town, by which he probably means stagnation of the atmosphere, which is surely a mistake, as this is usually a concomitant of dampness of the soil, and does not favour evaporation from the latter or from the leaves. The great dryness of the soil is due to the lessened rainfall of 1891 and 1892, and the incessant drainage of the soil caused by the excavations, often at a great depth, for sewers, railways, houses, &c. The soil round about these is not consolidated like the undisturbed subsoil, and doubtless it serves to drain off a great deal of the water over large areas, and this, too, in spite of the immense tract of clay which underlies London.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—This Society will hold its meeting next year at Chester, on Monday, June 13, and four following days. It has been decided by the council that prizes shall be awarded for the following exhibits:—Jams, and preserved fruits and vegetables (all of 1892 growth): Collection of whole fruit jams, collection of bottled fruits, collection of preserved fruits for dessert purposes, collection of preserved Peas, French Beans, Tomatos, and Mushrooms, for cooking purposes; collection of dried or evaporated fruits and vegetables for cooking purposes. Cider and Perry (to be made from fruit grown in 1892. Open to both makers and growers): Cask of not less than eighteen, and not more than thirty, gallons of cider made in the autumn of 1892; twelve bottles of cider made in the autumn of 1892, twelve bottles of cider made in any year before 1892, and twelve bottles of perry. The prizes range from £3 to £1 in the case of fruits, and from £5 to £1 for cider and perry.

EVAPORATED FRUIT.—At a recent flower show at Ledbury, Mr. RICARDO, of Bromesberrow Place, Ledbury, exhibited a case of evaporated fruits and vegetables, grown and prepared by his gardener, Mr. W. TROTTER. The exhibit comprised samples of Apples, Pears, Plums, Apricots, Cherries, Damsons, Peaches, &c., as well as French Beans, Green Peas, and other vegetables of last year's growth. Their flavour, when cooked, it was stated, was in every case equal to that of the fruits and vegetables in their original state. The drying of the fruits and vegetables was done by one of PH. MAYFARTH & Co.'s "American" Evaporators. Mr. TROTTER informs us that he will be happy to supply any information that may be desired by such of our readers who may be interested in this useful invention.

"THE GENUS MASDEVALLIA."—The third part of this useful illustrated work, comprising figures of M. Armini, Carderi, caudata, coccinea, coriacea, Davisii, Estradae, polysticta, triangularis, and Wageneriana, has just been issued. The work is founded on the collections of the Marquess of Lothian at Newbattle, and the plates and descriptions are executed with care and fidelity by Miss WOOLWARD, with notes by Consul LEHMANN. We shall probably advert more at length to this important monograph; in the meantime, we may point out the inconvenience that arises from the circumstance that neither the plates nor the sheets of text are numbered.

OXFORD UNIVERSITY EXTENSION.—The course of study of botany, which has been attended by a considerable number of County Council scholars, has just ended. Under the direction of Mr. CLARIDGE DRUCE, M.A., the students have attended twenty-eight lectures, each followed by a botanical excursion in the vicinity of Oxford. The neighbourhood of the city has been visited within a radius of some miles by the students under guidance. Near the remains of Godstowe Nunnery, the conductor found in a ditch a specimen of the plant *Nitella mucronata*, which has only been discovered three times in England, viz., about 1720 by Professor DILLENIUS at Isleworth, next by WILLIAM BORRER, in Sussex, about 1830; and, thirdly, near Bedford, in 1884. The students have studied the natural orders and been shown how to collect, to dry, and to arrange a herbarium. In the excursions, about 250 plants were named and described. The attendance was remarkably uniform throughout the course. In view of the fact that a large number of scholars sent up by county councils are attending the lectures, some prominence is being given to topics of technical interest. For example, a lecture was given on "Bees and Beekeeping," by Mr. W. J. ANSTEY, of the Oxfordshire Beekeepers' Association, and a lecture will also be given on "Farriery" before the meeting ends.

MISSOURI BOTANICAL GARDEN.—The third annual report of this garden is now published. It was, we may recall, founded by the munificence of an Englishman naturalised in the United States, Mr. HENRY SHAW not only left this fine garden for the public use, together with funds adequate for its maintenance as a scientific institution, but, like a true Briton, he also provided that once in each year a banquet should be held, to which representative horticulturists and botanists shall be invited, and another banquet expressly for gardeners. The report before us contains an account of the proceedings at these festivities, which will, doubtless, in course of time, evolve into something beyond a meeting for the promotion of good fellowship, though that in itself is no mean object. An announcement at the banquet, made by the Hon. J. W. NOBLE, Secretary of the Interior, will be read with pleasure wherever a love and reverence for trees exist. "I have had," said the Secretary, "an opportunity given me to say that the *Sequoia gigantea* shall no longer be ravaged by the herder, nor consumed by the fire of the man that wants to make a camp, regardless of those wonders of the world that future generations ought to be allowed to admire." The same gentleman has been instrumental in adding to the famous Yellowstone Park 20,000 square miles (they do things on a grand scale in the States), "that the trees there might preserve the sources of our rivers and fertilise our plains. It is my purpose, if I can, to have this ground so guarded by force that the grand flora of the United States . . . may once more bloom, and not be made the herbage for the sheep from Mexico." Professor LAWSON, of Nova Scotia, alluded to the School of Horticulture established in the Garden, and was followed by Professor RILEY, both of whom expressed their sense of the value of the services of Professor TRELEASE, the Director. Professor COULTER combated the general notion that a botanic garden is a sort of place for the propagation of nosegays. The festsal record is followed by a revision of the American species of *Rumex* (Dock),

which is certainly rather a leap and a bound. We may incidentally call attention to the great waste at present committed in not turning to account the seeds of these plants. No one who sees the profusion of seed, and notes its richness in starch, but will regret that this should be reserved for the use of the sparrows only. Professor RILEY follows with a summary of his observations on the fertilisation of *Yucca* by the *Yucca* moth, *Pronuba yuccasella*, and this interesting paper has appended to it some notes on the botany of the genus, by Professor TRELEASE, including a list of the species, illustrated by numerous figures scattered through the volume.

HOW DO FLOWERS ATTRACT INSECTS?—In considering the effect which the colour and odour of flowers produce in the sense-organs of insects, we are too apt to assume that the things which please human beings please also the lower types of life. It may be doubted whether too much has not been taken for granted in the prevalent theory of the part played by the bright colour and sweet scent of flowers in attracting insects for the purpose of pollination. Can we not at once call to mind instances of odours and flavours which though absolutely repugnant to the senses of human beings, are apparently enjoyed by animals. And why is this? Perhaps, because of the fact that the visual and olfactory organs and perceptions of many animals are very different from our own. Prof. T. CARNUEL, in a recent series of papers in the *Bot. Centralblatt* (vide, xlix., 1892, pp. 232, 263, 293, and 360), discusses a number of well-authenticated instances in which the effects of odours and flavours upon animals are entirely different to those of the same odours and flavours upon the sense-organs of human beings. He also calls attention to the facets on the eyes of insects and to their ocelli, and especially dwells upon their extreme sensitiveness to the ultra-violet rays of the solar spectrum. In these respects insects are widely different to human beings, and it is probable that we have yet to discover the function of flowers in attracting insects.

ABSORPTION OF WATER BY LEAVES.—Most people are under the impression that plants can absorb a good deal of the moisture necessary to their existence through the pores of their leaves, but this is, in the main, an error. It is, generally speaking, only the "rootless" Epiphytes and certain xerophilous plants that can take in water in this way. Sufficient observations have not yet been made upon tropical plants to enable a generalisation to be safely made, but Herr A. BURGENSTEIN has come to the conclusion that, although the absorption of moisture may take place to a certain extent through the epidermal cells, the stomates, and the hairs, it is of no physiological importance, at least as regards the flora of Europe. For details, vide *Bot. Centralblatt*, xlviii., p. 186.

STONE EDGINGS.—In Canon SWAYNE'S garden at Salisbury, some of the beds of Alpines are edged with blocks of stone placed not as usual parallel with the margin of the bed, but more or less at right angles to it. Thus between stone and stone, a little pocket is formed, in which the plants luxuriate according to their kind. The formality of straight lines is thus delightfully obviated, whilst the careful selection of suitable plants which is so marked a feature of this garden is a safeguard against the over-vigorous growth and encroachments of fast-growing plants.

PUBLICATIONS RECEIVED.—*Proceedings of the Agri-Horticultural Society of Madras.*—*Proceedings of the Agricultural and Horticultural Society of India, April—June.*—*Report on the Hills of Louisiana.*—*Bulletin of the Agricultural Station, Louisiana State University.*—*Agricultural Gazette of New South Wales.*—*Annales Agronomiques.*—*The Genus Masdevallia*, plates and descriptions by Miss F. H. WOOLWARD. Part III. R. H. PORTEB, 18, Princes Street, Cavendish Square.—*MÖLLEB'S Deutsche Gärtner Zeitung.*—*Report of the Department of Agriculture, Cape of Good Hope.*—*British Mosses*, by the Right Hon. Sir EDWARD FAY (WETHERBY & Co.).

HOME CORRESPONDENCE.

CARNATIONS AS EXHIBITION FLOWERS.—In a review of the *Carnation Manual* which appeared recently in the *Gardeners' Chronicle*, the exhibitors of this flower were exhorted to attempt some other method of displaying the flowers at Carnation shows than that generally adopted. I think it will take years to induce Carnation exhibitors to depart from the old way, and I am not at all certain that there is any pressing necessity why they should do so, because the cultivator for exhibition looks upon the flower from an altogether different standpoint to that of the writer of the review; and while others are at liberty to adopt what methods they please, the florist may be left to take his particular way to reach the end he has in view. That the present mode of exhibiting the blooms does not display them to the best advantage as mere decorative agents no one will deny, and therefore, any attempts in this direction should be encouraged, and it can be done without interfering in any way with the methods of the strict florists, who go to a considerable expense to obtain stands and boxes for the purpose of exhibiting his flowers. At an exhibition held recently at Kingswood, near Bristol, there was a class for twelve varieties of Carnations and Picotees, three blooms of each, and a stand from Mr. F. Hooper of Bath, which gained the 1st prize, appeared to suggest a way by which the decorative value of the flowers can be enhanced. Mr. Hooper's flowers were remarkably good for the season, and they were arranged in the form of a triangle, two blooms forming the base, and one the apex. Mr. Hooper arranged his flowers with excellent effect; they were exhibited on a box, the stems of each bunch in a tube of water, and most attractive they were. They were not backed by their foliage, and I do not think the flowers lost anything in the way of effectiveness through its absence. I think the committee of the National Carnation and Picotee Society, acting upon the suggestions thrown out by the writer of the review, might attempt such a class as at Kingswood another season, and with advantage. They have tried the experiment of plants in pots as decorative agents, and they can now fairly make an attempt with cut blooms. *R. D.*

TOMATOS.—It is one of the anomalies incidental to Tomatos that whilst market dealers in these fruits will not have large ones at any price, judges at exhibitions, when Tomatos are exhibited for prizes, will show no respect for other than large fruits. Presumably, judges will say, "We cannot concern ourselves with what may be the needs or prejudices of the market trade. If we find allied to size in Tomatos great beauty as well as fine form and colour, we must give to such features the highest awards," and to such reasoning there can be barely any rejoinder. Still, it may be assumed that just as Melons are judged, not for their size or appearance (than which nothing can be more misleading), but for their flavour, why not Tomatos. To that there is this obvious reply, that whilst flavour in Melons admits of the widest differences, a few being really good and pleasant eating, the many being comparatively nauseous or tasteless, in Tomatos flavour is comparatively indeterminate, because it is a quality that is far from being prominent, and varying only in a very indefinite degree. Some Tomatos seem to be rather brighter and more piquant than others, much, however, depending upon the period of maturity arrived at by the fruit, also as to how long gathered. A fruit picked fresh and eaten at once is often much better flavoured than is one that has been gathered several hours. Also fruits that are just ripe are usually better than are fruits left to become more highly coloured, but still rather over ripe. Then, I am sure, it is a fact that the best of what flavour Tomatos have is not found in the largest fruits. The best Tomato joke perpetrated was that of the old gardener of Burghley, who, in sending up the biggest fruits ever seen to the Fruit Committee not long since, added a flask of hock to be employed in helping the members of the committee to discover the inherent flavour lying deeply hidden in these gigantic samples. Possibly, it might have been thought that the alcohol would rather assist to destroy what natural flavour the fruits possessed, but it was difficult to kill what was already dead. If the smaller kinds of Tomatos are ever to find favour on exhibition tables, it will only be by the insertion of classes for clusters, say, six of any one or more varieties; and that some such classes should be

promoted, seems obvious, in face of the fact that fruits which weigh from four to five in the lb. are far more acceptable in the market than are the bigger ones of two to the lb. or three to 2 lb. The beautiful golden or orange-coloured varieties, some of which are apparently of the best flavour, are shut out from honours entirely when they have to compete on equal terms with red ones, whilst separate classes for them, or classes which made a portion of the dishes to be yellow compulsorily, would be of great use. The day may yet be some way off when we shall see Tomatos accepted everywhere as dessert fruits, but were such the case dishes of the yellow, as well as red, would very much enhance the beauty and variety of a dessert course. We have in such varieties as Ham Green Favourite, Sutton's A1, Challenger, Conference, Cluster, Chiswick Red, and others, a red colour that comes into this category, and there are some yellow ones, especially the beautiful Golden Nugget, which was certificated at Chiswick in 1890, a fine bunch or cluster variety, so that it would be easy to make up collections of several forms for exhibition, or a succession of sorts if desired to give variety to the dessert course. *A. D.*

PAULOWNIA IMPERIALIS.—Though the Paulownia is a deciduous tree, with the habit and general appearance of *Catalpa syriaca*, it is, nevertheless, very distinct, and belongs to a different natural order Scrophularinæ. Its flowers, borne in large bunches, in form, size, and colour, resemble those of the Foxglove (*Digitalis purpurea*)—individually, they are extremely beautiful, and, indeed, quite unique. Introduced from the southern provinces of Japan by Siebold in the year 1837, he named it after the hereditary Princess of the Netherlands. In Japan, the tree grows to heights of 30 or 40 feet. It is recorded that a plant planted at the above date in the Paris Jardin des Plantes was, after three years' growth, or in 1840, nearly 12 feet high. I have looked through a modern work on French gardens, but find no reference to growing examples. [Some of the Paris streets are lined with it. Ed.] I am able, from personal knowledge, to say, the Paulownia will grow to goodly proportions even in this country, between the occasionally very severe winters we experience. A tree near my present abode, having attained to a height of 15 feet with a considerable bole, was only destroyed by the excessive severities of a few winters ago. As young trees are obtainable at from 1s. 6d. to 5s. each, further trials should be made. Besides, it is not difficult to twist haybands around their straight, smooth holes and branches on the approach of severe frosts. *William Earley.*

LILIUM AURATUM.—The plant in question of this grand Lily is no doubt a good specimen, and better than is generally seen; but what would "W. D." say if he had seen the specimen that has just done flowering in these gardens? It is in a 28-inch pot, and threw about forty shoots, and carried 218 blooms, the majority of them being larger than any I have seen before. It was not potted this year, but had a strong top-dressing of peat, sand, and cow-manure, and when it was in full growth it was fed with manure-water every time it was watered. We intend putting it in a large tub next season. *H. Kempshall, Potshull Gardens, Wolverhampton.*

ONIONS.—I saw the other day in the fine kitchen garden at Hackwood Park, and a splendidly-kept and cropped garden, too, at once one of the finest ordinarily-grown crops of Onions, and the finest samples of Onions, I think, I have seen anywhere. The large samples were of Ailsa Craig, Anglo-Spanish, Wroxton, and Lord Keeper, but the first-named were by far the finest. These were grown on a south border, where plants, raised from seed sown under glass in January, and dibbled out early in April, in rows 18 inches apart, had produced bulbs weighing, of the best, from 2 to 2½ lb., and very handsome also. These will have to take their chance, however, with other fine samples at the Banbury Onion competition next month. Of course, they are useful chiefly for exhibition, but are also very valuable for seed stocks, as these picked bulbs develop the finest strains. The ordinary stocks of Onions were of Main Crop, Wroxton, Sutton's A1, Brownlobe, and Anglo-Spanish. The bed comprised twenty-eight rows each, 38 yards long, a total of 1056 yards, or nearly three-fifths of a mile. The rows were 15 inches apart, and the bulbs, all of which when pulled would be of the best average size, were standing in the rows as close as possible. When so much is heard of maggot and mildew, such a bed as this

seemed to be a perfect wonder. The seed was sown on March 21, a good time, if the weather and soil be both in good form. The stems had just been laid all one way with the greatest precision; allowing three bulbs to the foot run, the numbers should be close upon 10,000, and Mr. Bowerman expects to find from fifty-six to sixty bushels, at the very least, after the bulbs have been cleaned. The Onion crop is always made to follow on Autumn Cabbages, or some similar green crop; then the soil is trenched and well manured. It is naturally stiff, and is to some extent lightened by a free use of leaf soil, which seems to form the staple manure for the Potato crops. *A.*

HORSE PLUM.—One of your correspondents asks about the Horse Plum; the kind known in this neighbourhood as such is a red oval fruit—it is, I should say, an old English kind. If he wishes it, I will send him a specimen. *J. Marshall Sturges.*

UPRIGHT v. SPREADING VARIETIES OF APPLES.—This may not be perhaps the most seasonable period at which to discuss the varieties of Apples to plant next autumn, but it is undoubtedly the best time to take note of the various styles of growth which different kinds adopt with a view to the future arrangement of the trees and kinds. In looking down the long rows of bush trees in a market garden noted for its good Apple culture, where all the best and newest kinds are tested side by side, I could not but notice the manner in which many grew, and what object-lessons they provided. For instance, Worcester Pearmain and Lady Sudeley grow almost erect in habit, occupying but little space as compared to Lane's Prince Albert or Warner's King, which have a spreading habit. Just for a moment consider the space required to plant a number of the latter as compared to that of the former sorts, and note the advantage there must be in planting the two sorts side by side, which are so diverse in character of growth, resulting in a decided saving of space, and the advantage of the trees individually. One does not rob the other of light and space. The subject which I have here touched upon is well worthy of considerable attention, and at no time can the habit of different varieties be so well studied as when they are in full vigour of foliage, and carrying a full crop of fruit, which tends to spread the branches out to their fullest extent. *E. M.*

IN PRAISE OF THE FAN.—Some few years ago plant-training having gone mad, was very generally condemned by good judges in matters of taste, with the result that endeavours were made by plant cultivators to do without trellises as much as possible; but, finding that some species of plants could not be made presentable without something to which the shoots, young and old, could be secured, the balloon form of trellis became the fashion. Now, this seems to be a pity, as, by its use for all kinds of plants, only a part, say one-half, of any plant can be seen unless tilted up toward the spectator, as at exhibitions, when a bird's-eye view is obtained of the part where most of the bloom is to be found. On a flat or a stepped stage, only the side is visible. Would not most climbers of the stove and greenhouse look to greater advantage if trained on a trellis of a fan-shape? Each flowering-shoot would then be seen at full-length, and the flowers would be seen all on one side. It may be said that it is a dreadfully artificial style of training. I reply, so is the balloon, and if you must have a trellis, there is no escape from artificiality. Peas and Beans are supported by rough dead sticks, but no one condemns the practice of sticking, unless it be the urban cultivators, who are far from plantations, and find their Pea-sticks expensive. The fan favours extension, and it, therefore, would admirably suit the Allamanda, Bougainvillea, Stephanotis, Lapageria, &c.; and if the ribs are neat, and painted dark green in colour, they are nearly invisible, even where they are not clothed with shoots and leaves; and it is, moreover, certain that the deadly uniformity of exhibition plants would disappear if we were to introduce this form of trellis in place of the balloon. Moreover, the practice of fastening the growths of some of these plants to strings fixed close under the roof would no longer be needed, as a fan-trained plant could be so placed that it would enjoy the sun's beneficent rays to the utmost. *A. Fanner.*

ABNORMAL PEACHES AND NECTARINES.—We have to-day gathered five fine Peaches and two small Nectarines from a pot tree of the Violette Hâtive Peach which stood in rather a shaded position. We

are aware that this is not unusual, but the remarkable part to us is, first, that the Nectarines, though growing in the best position at the top of the tree, were very small, weighing only 2 oz., while the Peaches were 5 oz. each. The latter had the true rich sweet flavour inherent to the variety, while the Nectarines were of Etruge flavour, and a little bitter, and only differed from the type in being redder at the stone, and the colour had run more to the skin than is usual in Nectarines. Although we have grown these subjects for years, a similar case has not been observed. *George Bunyard & Co., August 26.*

VANDA CÆRULEA.—*Apropos* of the remarks on this species at p. 247, it will interest Orchid-growers generally, and especially those who doubt the possibility of growing and flowering *Vanda cœrulea* on an improving scale, to know that the two large specimens in Lord Rothschild's collection at Tring Park, Tring, are kept in fine condition by Mr. Hill. There are twenty-five strong spikes of bloom on the one, and twenty-two on the other plant. A quantity of smaller plants are also sending up their flower-spikes, even the smallest pieces showing for bloom. The large violet-netted Tring Park variety, which is the most beautiful dark form of *V. cœrulea* known, will be in bloom again shortly. *J. O'B.*

DEW, AND ITS ACTION ON PLANTS.—The assertions of Professor Wolny are not likely to derive much support from arguments such as are contained in the letter of your correspondent "T. II." With reference to Professor Henslow's experiments (an interesting account of which appeared in your issue of June 25 last), "T. II." contends that "as there was a heavy dew on at the time, it is very probable that the moisture was absorbed by the stalk of the leaf, and not through the cuticularised surfaces of many of the leaves." The value of this "contention" is, however, reduced to *nil*, by the statements contained in the last two clauses of the same sentence: namely, that (1) "it is a well-known fact, that these surfaces are well-nigh impervious to water;" and (2) "the amount of moisture that would be required to enable any of the leaves (in the list he supplies) to regain their normal condition, would be very small indeed." It is perfectly obvious that if the amount of moisture required be "very small indeed," it is quite possible that such necessary amount may be absorbed by surfaces which are only "well-nigh" impervious—for the term "well-nigh impervious" implies some degree, however small, of perviousness. With all deference, I should like to be allowed to paraphrase "T. II.'s" concluding sentence thus:—"It is scarcely necessary to say, that when contentions of this kind are engaged in, the utmost care is necessary; for if some of the primary rules of logic are overridden and ignored, we cannot expect to arrive at true and correct results." In view of the importance of the subject to gardeners, it is much to be regretted that Professor Wolny or his disciple, Mr. Matthewman, has not seen fit to favour the readers of this journal with some account of the Professor's experiments, and a summary of the deductions drawn therefrom, set forth in logical sequence; for with them lies the onus of proof. I pointed out in a previous communication, and now beg to repeat that, in the absence of serious argument, the refutation of the new-fangled doctrine is out of the question, and, I might add, quite unnecessary. *C. W. Herbert Greaves.*

—On page 219, "T. II." quotes from a work on Physics, by a Mr. J. Aitken, respecting dew, thus:—"That the greater part of true dew is formed from the vapour that rises from the heated ground, and has been trapped by herbage and other cold objects." If so, one would naturally expect to see dew on the under-part of leaves when not present on the upper surface, and it certainly should be more copious, but such is not the case. I have no work on Physics to quote from to refute Mr. Aitken, nor to support what I said in a previous letter, or what I may say in this. Mr. Aitken in the quotation says that "the drops seen on grass and leaves are not dew at all, but moisture exuded from the living plant." Last Saturday morning was one of those unusually dewy mornings, with the thermometer nearly down to freezing, frost having actually been formed on the grass in low situations. On such mornings I have noticed dewdrops every inch or two on the lower side of some hundreds of yards of stretched wire the thickness of an ordinary lead-pencil, the remaining portion of the wire being covered with a film of mois-

ture interspersed with particles of various sizes, like so many tears, exactly like those on the Cauliflower, Cabbage, and Seakale leaves near by. Where the leaves of these plants were moderately flat, globules of water, the size of a sixpence or a shilling, lay in their crinkled recesses, and those of the Seakale were notably so, but not so much film and drops on their surface. The presence of the film and drops on the strained wire I attribute to the same natural law as produced those on the plant-growth, and to convince me otherwise, I must have more evidence than a mere statement of Mr. J. Aitken, or the solitary experiment of Prof. Wolny in that distant puddle of his. I further observe that Mr. Aitken states that "dewdrops are only found at the extremities of leaf veins," &c. My observations are, that they are not confined to the leaf veins, but are indiscriminately distributed over the intervening spaces as well. If, however, the accuracy of my observations is questioned on this point, there are the drops on the strained wires to be explained. *W. P. Roberts, Cuerden Hall, Preston.*

LETTUCE-GROWING BY ELECTRICITY.—Without further tests on this side of the water of the alleged value of the electric light as an aid to vegetable growth in the winter months, I must regard the statements copied from an American journal by the *Gardeners' Chronicle* as being rather hypothetical. There are, besides, the doubtful advantage of making plants grow when they should be resting; and a surely somewhat erroneous statement that the plant "headed-up better under the light," and that the "quality is superior." Now, as the area of the house specially mentioned is given at one-third of an acre, i.e., 1493½ square yards, or 1,934,928 square inches, and the number of plants 24,000; a simple-division sum will show that each Lettuce plant stood on a space of 8½ square inches—not, be it remembered, a space measuring on each side 8½ inches, which is something very different. As all practical men know, this small space of 8½ inches is all too small for even a moderate-sized Lettuce, say of the Tom Thumb or All the Year Round, or any varieties of small Lettuces that we are acquainted with in this country, leaving the larger-growing Cos varieties out of the question, to grow and form a head. Indeed, I should greatly doubt the possibility of growing Lettuces to form a head—even when the smallest-growing varieties are chosen—on less space than a square of 6 inches, i.e., 36 square inches, or four times the space given in the quotation from the American journal. Planting Lettuces closer than this would mean excessive etiolation from lack of light, and great loss of plants from damping off, which would be all the greater owing to the thinness of the leaves. The removal of the fertile top-soil also seems to me to be an error in practice, unless some other equally fertile top-spit be substituted for it. And why fear the germs of fungi, as necessitating its removal, if properly cultivated? Moreover, it must be a particularly skilful ploughman, too, who would turn his team on the "headland" of such an englassed field, without smashing the glass walls of the house, or playing havoc in other ways. The fact is, the whole thing smacks rather of the desk than the practical cultivator, and as I said at first, it needs further test and more "light." *A Non-believer.*

BEANS AND CABBAGES AT CHISWICK.—A large selection of Runner Beans and Cabbages is grown for trial at Chiswick this season. On a recent visit of inspection it was seen that the Runner Beans included, white-flowered, several varieties; scarlet-flowered, numerous; and French Runner and Butter Beans, even more abundant. Of the first-named, or white-flowered forms, the best were Jubilee (Carter), a very fine greenish-podded variety, and free; and Giant White, very like the former. Both these obtained three marks. The very large broad-podded Czar obtained two marks. Then, of scarlet-flowered forms, Hill's Prize and Sutton's Prize-winner, both very handsome forms, or selections of Ne Plus Ultra, obtained three marks. So also did Veitch's Giant, apparently a scarlet-flowered form of Jubilee. The stocks of Ne Plus Ultra, really not good ones; and Giant Titan and Invincible, a fine long-podded sort, but having on many of the pods a reddish colour, received two marks. The names given to some of these Beans, Gigantic, Elephant, Mammoth, Giant Titan, &c., evidence the undue dimensions of the pods of some of the more recent selections. The French climbing types were very varied, and included some having blue and violet coloured pods that are very handsome, and

would look very effective if employed solely for the covering of arches or trellises. The best of the section was Sutton's Tender and True, really a climbing Canadian Wonder Bean, very handsome and productive; this had three marks; so also had Filibasket, a very fine tender fruiting form of the old Cass-knife, but much better. The best of the Butter Beans were Hungarian Butter (Vilmorin), delicious soft, marrowy flesh, and delightful if cooked for children; Mont d'Or, so well known as one of the best; and Flsgeiolet Wax, a very free, delicious Bean, of a rich golden hue; a fourth variety, Emperor Frederick, secured two marks. Of the entire number, a quantity of the most promising were selected and part cooked whole. The above awards were given after these had been tasted. The white Cabbages grown included some thirty varieties, and it was agreed that the marks granted last year be confirmed, as none were new. Amongst the best forms were L'Étampe, Early York, Improved Nonpareil, Oxheart, or as known in the Midlands, Spratborough, sent as Little Pixie; Allheart, very fine and good; Wheeler's Imperial, Atkins' Matchless, Sutton's Earliest, and Barr's Best of All were all excellent stocks. Of Savoy Cabbages, Crock's Favourite, Earliest Dwarf Vienne, Earliest of All, Early Elm, and Dwarf Green-curved were the best of the early section. These, however, would all be better sown later, so as to heart-in during October rather than in August. The Cabbage trial is an excellent one, and, having the advantage of being practically public, offers capital opportunity for gaining information respecting Brassicas.

SOCIETIES.

THE INTERNATIONAL FRUIT SHOW.

August 26, 27.—The much-talked of fruit show at Earl's Court has come and gone, leaving the impression that it was one of the best, taking things all round, that we have witnessed. If one may make comparisons, we should say that it was not quite so good in Grapes as the Caledonian Society's show of last year in the Waverley Market, Edinburgh; but that in Pine-apples, Apples, Plums, Pears, Figs, Peaches, and Nectarines, and especially in the home-grown and foreign market produce, it exceeded that capital fruit show of the North.

It was a remarkable fact that California was able to send us Bartlett (Williams' Bon Chrétien) Pears as good in flavour and higher in colour than our produce of the same variety, in spite of having been fourteen days in transit. These fruits, and any others which they may send us, cannot be sold at higher prices than our own, and it will be a curious upshot of our endeavours to increase our fruit supplies, if the foreigner 10,000 miles away should be enabled to send fruit to our markets at any profit to himself. It is a race in which he, with dear labour, cheap land and carriage, but with much time lost in transit, has to compete with the home grower, who, it seems to us, is handicapped by dear land, uncertainty of tenure, dear labour, and high freight charges by land. If three of these factors—tenure, rent, and freight charges—which are all within our means to remedy were, as regards the first, removed and the others lightened, we could compete on more equal terms.

With regard to the quality of the hardy fruit shown, it was remarked that the samples were, although late, pretty fairly developed. As regards Apples and Pears, these have six weeks longer in which to reach full size. Peaches, Nectarines, Plums, and Figs, from out-of-door trees were good in flavour, size, and colour, and remarkably free from all forms of fungus growths. Some of the Peaches, and these of large size usually, had the shrivelled, burned appearance at the apex, which some growers attribute to want of water at the root as the fruits approach ripeness. The heavy bloom on Plums and on Grapes was a subject of general remark. As regards these last-named fruits, we have seen much heavier bunches of nearly all varieties shown, and the colour and finish of Muscat of Alexandria was in no case up to the standard—a fact, doubtless due in the main to the early date at which the show was held—in another month the much-admired golden tint will be more generally found on this variety.

Collections of Fruits.—For collections of fruit of not less than twenty dishes, which should include

four varieties of Grapes, two Pine-apples, two Melons, two dishes of Peaches, two of Nectarines, and two of Plums, the remainder to be distinct—1st, Mr. McIndoe, gr. to Sir J. W. Pease, Bart., Ilutton Hall, Guisborough, with an exceedingly fine lot. The following were the kinds and varieties shown in it: Charlotte Rothschild and Queen Pine-apples, Negro largo and brown Turkey Figs, Golden Eagle and Violette Hative Peaches, Laxton's Noble Strawberry, Elruge and Humboldt's Nectarines, Pears Bon Chrétien and Souvenir du Congrès, Bigarreau and late Duke Cherries, white and red Dutch Currants, Best of All and Exquisite Melons, Magnum Bonum and Kirke's Plums, Duchess of Gloucester and another Apple, Exquisite Orange, Imperial Lemon, Whinham's Industry Gooseberry, and fruits of *Passiflora edulis*. The Grapes consisted of Golden Champion, large sprawling bunches; Gros Maroc, nice in every way, as were the black Hamburgs; and Duke of Buccleugh, good compact bunches. So far as we were able to judge, these fruits were in the best condition for consumption. The 2nd prize fell to Mr. Goodacre, gr. to Lord Harrington, Elvaston Castle, Derby. Particularly good examples were the dishes of Royal George and Barrington Peaches, Moorpark Apricot, Victoria Nectarine, Morello Cherries, Muscat and Barbarossa Grapes, Queen and Smooth Cayenne Pines, and Vicomtesse H. du Thyry Strawberries. 3rd, Mr. H. Ward, gr. to Earl Radnor, Longford Castle, Wilts, who had very nice Gros Maroc, Buckland Sweetwater, and Madresfield Court Grapes, Brunswick Figs, Sea Eagle and Walburton Admirable Peaches, Pine-apple Nectarine, and Morello Cherries. Only three competitors entered in this contest.

For twelve dishes, distinct.—1st, Mr. R. Parker, gr. to J. Corbett, Esq., with Grapes Muscat of Alexandria, Alwick Seedling, very fine examples; Princess of Wales Peach, Elruge Nectarine, Apricot Large Early, two Melons, smooth-leaved Cayenne Pine, Morello Cherries, and Kirks' Plum; 2nd, Mr. G. Reynolds, gr. to Messrs. Rothschild, Gunnersbury Park, Acton, with very fine La Grosse Sucrée Strawberry, Gros Maroc, Muscat of Alexandria, and Golden Esperion Grapes, &c.; 3rd, Mr. T. Coomber, gr. at The Hendre, Monmouth, whose smooth-leaved Cayenne Pine, Gros Maroc Grapes, and Bellegarde Peach were very good examples.

For the collection of eight dishes, Pine excluded, 1st, Mr. McIndoe, with very fine Duke of Buccleugh and Black Hamburg Grapes, Golden Eagle Peach, and Humboldt Nectarine, &c.; 2nd, Mr. J. Dumble, gr. to Sir C. Phillips, Bart., Haverfordwest, his best dishes being Elruge Nectarine, Black Alicante and Muscat Grapes, and Sea Eagle Peach; 3rd, Mr. J. Dawes, gr. to M. Biddulph, Esq., M.P., Ledbury, who had fine Barrington Peaches, La Favourite Melon, Bigarreau Napoleon Cherries, very fine Roman Apricot, Gros Maroc Grapes, and extra large Humboldt Nectarines; 4th, Mr. [A. Ocock, gr. to Mrs. McIntosh, Romford.

Collection of Grapes.—Ten varieties, two bunches of each.—1st, Mr. McIndoe, Guisborough; these consisted of Lady Downes, Golden Champion, Gros Maroc, Gros Guillaume, Duke of Buccleugh and Black Duke (a very promising seedling variety out of Gros Guillaume), by Duke of Buccleugh, amongst his best examples; besides the above were Alicante, Black Hamburg, Trebbiano, and Gros Colmar. 2nd, Mr. G. Reynolds, Gunnersbury Park, with large well-coloured Muscat of Alexandria, Alwick Seedling, Gros Maroc, very fine and large; a seedling variety from Muscat of Alexandria, and Black Hamburg, with a large globular white berry. Mr. Goodacre was 3rd, and Mr. H. W. Ward the 4th.

In the collection of five varieties of Grapes, Mr. W. Allan, gr. to Lord Suffield, Gunton Park, was 1st; Mr. Elphinstone, gr. to E. M. Mundy, Esq., Shipley Hall, 2nd; Mr. J. Bury, gr. to C. Bayer, Esq., Forest Hill, being 3rd.

In the class for Black Hamburg Grapes, three bunches, Mr. J. Gibson, gr. to Early Cowley, Esq., Chippenham, was 1st; Mr. G. Reynolds, 2nd, with a very symmetrical lot of bunches, perfect in colour; Mr. J. McNaughten, gr. to Earl Tankerville, Kingston-on-Thames, 3rd.

For the best three bunches of Muscat of Alexandria, 1st, Mr. G. Reynolds—large bunches of an even size, ripe, and high of colour; 2nd, Mr. J. Dumble, with larger bunches, but smaller berries; 3rd, Mr. W. Elphinstone—good, well-coloured fruit.

The prize for the best Gros Colmar, three bunches, fell to Mr. McIndoe, 1st, with typical bunches, of fine colour and size of berry. No other prize was awarded in this class.

The best Madresfield Court Muscat being shown

by Mr. J. Gibson, with perfect, symmetrical bunches of large size; Mr. G. Elliott, gr. to P. Graham, Esq., Molesey; and Mr. J. Bury, Forest Hill, the prizes falling to them in the order of their names.

Black Alicante Grapes were well shown by Mr. T. T. Wright, gr. to C. Lee Campbell, Esq., Ross, 1st; Mr. J. Hollingsworth, Uttoxeter, Derby, 2nd; and T. F. Rivers & Sons, Sawbridgeworth, 3rd.

Grapes of any other white variety were shown by Mr. P. E. Kay, Finchley, 1st; W. Elphinstone, with Cannon Hall Muscat, 2nd; Mr. T. Osman, Chertsey, with Mrs. Pearson, large bunches, but small berries, 3rd. Grapes of any other black variety, 1st, Mr. G. Reynolds, with fine Gros Maroc; 2nd, Mr. T. Coomber with the same variety, very big berries and bunches, and jet black; 3rd, Mr. W. Iggulden, gr. to the Earl of Cork, Marston House, Frome, with the same, with symmetrical bunches of fine quality.

The next class, that for a basket of Grapes containing 12 lb. packed for transit by railway, and delivered at a distance of not less than 10 miles, was a very important one, and here Mr. J. Hudson, Gunnersbury House, Acton, was adjudged the winner. His Grapes, which had in reality travelled to Croydon and back to the exhibition, i.e., about 46 miles, were simply laid in a cross-handled basket, secured merely by a piece of twine connecting the stalks; there was no sign of rubbing as to cause loss of bloom. Mr. C. Sutton, gr. to Earl Stanhope, Sevenoaks, was 2nd. His Muscats had travelled well in a like basket. Messrs. T. F. Rivers were 3rd. In this instance the bunches were secured by their stalks to the sides of the basket.

For the best boxes of Grapes, conditions as in the previous class, 1st, Mr. J. Turton, gr. to J. Hargreaves, Esq., Erleigh, Reading. These bunches were secured to the sides of the box, which measured 15 by 10 by 7 inches, and held 10 lb. The 2nd prize was not awarded, and Mr. J. Dawes, Ledbury, was 3rd; his box was rather larger than the other, and heavily wadded at the sides and ends.

Mr. A. Methven, gr. to W. Keiller, Esq., Wimbledon, was 1st for one Pine, a Smooth Cayenne, weighing about 5 lb.; Mr. R. Nicholas, gr. to Earl Portesque, South Molton, being 2nd.

Mr. Wallis, gr. to R. Sneyd, Keele Hall, took 1st prize for three dishes of Figs; and Mr. J. Evans, gr. Melchet Court, Hants, was 1st for a single dish.

In the following eighteen classes, the fruit must have been grown and ripened in the open air. Peaches and Nectarines were shown in excellent quality, and competition in all the classes was very keen. Sir W. M. Collet, Bart., Sevenoaks (gr. R. Potter), was 1st for three dishes, showing good and highly-coloured fruit of Grosse Mignonne, Dr. Hogg, and Crimson Galande; Mrs. S. Clarke, Croydon (gr. William Carr), was 2nd, with Royal George, Dr. Hogg, and Noblesse; whilst the 3rd prize was gained by the Earl of Radnor, Longford Castle, Salisbury (gr. H. W. Ward).

For two dishes, the 1st place was taken by W. Biddulph, Esq., Herefordshire (gr. J. Dawes), with Abies and Violette Hative, the latter being very fine; Early Grosse Mignonne and Violette Hative were those shown by Mr. Haine, Highworth, who came 2nd; whilst Lord Foley, Ruxley Lodge, Esher (gr. J. Miller), was 3rd, with Noblesse and Bellegarde.

There were twelve entries in the class for one dish of Peaches, and the quality in most of them was first-rate. Fine, large, and well-coloured fruits of Hale's Early, brought Mr. J. Austen, Witley Court Gardens, Stourport, the 1st position. Sir M. W. Collet, Bart., was 2nd, with Crimson Galande, and Lord Gage, Lewes, Sussex (gr. G. Helman), was 3rd, with Early Beatrice.

For three dishes of Nectarines, the 1st prize was obtained by Sir M. W. Collet, Bart., for admirable examples of Rivers' Orange, Spencer, and Elruge; Mrs. S. Clarke was 2nd with Elruge, Lord Napier, and Princess Orange; and the Earl of Radnor, 3rd.

For two dishes, W. Biddulph, Esq., Hereford, was 1st with Lord Napier and Humboldt; and Lord Foley with Violette Hative and Pitmaston Orange, was 2nd. W. Biddulph, Esq., was 1st again for one dish, showing good even, well-coloured fruits of Lord Napier; J. Hargreaves, Esq., Reading (gr. Thos. Turton), was 2nd, with Humboldt; and Lord Napier secured the 3rd position for Lord Ebury, Rickmansworth (gr. J. C. Mandell). There were twelve entries in this class.

Plums.—In all of these classes competition was remarkably strong, eighteen to twenty entries having been staged in many of the classes, and many superb dishes of Plums, culinary and dessert, formed one of the strongest features of the exhibition.

The 1st class was for three dishes (distinct) of red Plums, and the premier position was attained by

Sir J. W. Pease, Guisborough, York (gr. J. MacIndoe), whose exhibits of Pond's Seedling, Victoria Denyers, and Sultan, left little or nothing to be desired. Messrs. T. Rivers & Son, Sawbridgeworth, followed with Sultan, Belle de Louvain, and Victoria; whilst good fruits of Magnum Bonum, Victoria, and Pond's Seedling, obtained the 3rd place for E. H. Watts, Esq., Chiswick (gr. A. W. Porteous).

Mr. W. Lane showed the best three distinct dishes of purple Plums, which were Kirke's Black Diamond and Englebert. The Earl of Cork (gr. W. Iggulden) was 2nd with Kirke's Czar and Blue Perdrigon; and Sir J. W. Pease was 3rd.

Plums, green or yellow, three distinct dishes.—The Earl of Cork, Somerset, was 1st for these, showing Early Transparent Gage, Golden Drop, and Washington; 2nd, Sir J. W. Pease, with Golden Gem, Green Gage, and Jefferson; the Earl of Radnor was 3rd.

Lord Braybrook, Saffron Walden (gr. Jas. Vert), was 1st for one dish of dessert Plums, showing fine coloured samples of Jefferson's; the Messrs. Rothschilds (gr. J. Hudson) was 2nd, with Kirke's; and Messrs. Rothschild (gr. Geo. Reynolds) 3rd, with Golden Emperor. There were seventeen entries.

One dish of culinary Plums.—The Earl of Radnor (gr. Mr. H. W. Ward), was 1st, with Diamond (red); J. Hargreaves, Esq., 2nd, with Victoria (purple); and Sir J. W. Pease, 3rd, with Magnum Bonum (yellow). Nineteen entries.

Apples.—These were shown in better condition than might have been expected, seeing that the crop is rather under the average. The 1st class was for six distinct dishes of cooking Apples, and there were ten entries. The 1st position was taken by J. Hargreaves, Esq., who had Peasgood's Nonsuch, The Queen, Catshead, Ecklinville Seedling, Warner's King, Lord Suffield, and Waltham Abbey Seedling; F. Cornwallis, Esq., Maidstone (gr. J. Mackenzie), was 2nd with Grenadier, Lord Suffield, Catshead, Emperor Alexander, Frogmore Prolific, and Lord Grosvenor, Messrs. Rothschild (gr. Geo. Reynolds), were 3rd, for a lot which included Gloria Mundi, and Pott's Seedling.

For the three best Apples, 1st, Mr. C. Slade, gr. at Worksop Manor, Notts, with very nice ripe fruits; 2nd, Mr. T. Coomber; 3rd, Mr. J. Fry, gr. to Captain Edwards, Pinner.

For three distinct dishes of cooking Apples, Mr. Will Tayler, Osborn Nursery, Hampton, Middlesex, was 1st with Lord Suffield, Warner's King, and the Queen; 2nd, E. H. Watts, Esq., Chiswick, with Peasgood's Nonsuch, Lord Suffield, and Warner's King; 3rd, G. Thompson, gr. to Messrs. W. E. Wells & Co., Hounslow.

For one dish of cooking Apples, J. Hargreaves, Esq., was 1st, with specially fine Peasgood's Nonsuch; F. Cornwallis, Esq., Maidstone, was 2nd, with Grenadier; and Mr. Will Tayler, 3rd, with Lord Suffield. There were twenty entries.

Mr. Geo. Goldsmith, was 1st, for three distinct dishes of dessert, showing Beauty of Bath, Lady Sudeley, and Astrachan Red; 2nd, Messrs. Rothschild (gr. G. Reynolds), with Duchess of Oldenburgh, Lady Sudeley, and Red Astrachan. J. Hargreaves, Esq., was 3rd.

Mr. A. Hester, Plumstead Common, was 1st for one dish of dessert, with Red Astrachan; Earl Stanhope, Sevenoaks (gr. C. Sutton), 2nd, with Lady Sudeley; and Mr. A. Wyatt Hatton, with Irish Peach, 3rd.

Pears.—Three dishes of dessert, 1st, Sir M. W. Collet, Bart., with Williams' Bon Chrétien, Souvenir du Congrès, and Clapp's Favourite. 2nd, Lord Gage, Lewes, with Beurré de Amanlis, Clapp's Favourite, and Williams' Bon Chrétien. In the classes for Pears, the effect of the bad season was strikingly seen, and the entries were but few.

For one dish, Mr. G. Helman obtained 1st for Clapp's Favourite; 2nd, Lord Ebury, with Albertine; and 3rd, Mr. Richard Parker.

The remaining classes were open to fruit grown under glass, or outside, and in the classes for dessert Apples or Pears, the fruit was to be ripe and fit for table.

For three distinct dishes of cooking Apples, the prize was awarded to J. Hargreaves, Esq., who had excellent fruits of Lord Suffield, Warner's King, and Peasgood's Nonsuch; Sir J. Pease was 2nd, with Peasgood's Nonsuch, Emperor Alexander, and Mère de Ménage, which were hardly inferior to the 1st exhibit; J. W. Wells, Esq. (gr. Mr. J. Nicholson), was 3rd, who included Yorkshire Beauty.

Messrs. Rivers & Son were 1st for one dish of cooking Apples, with wonderfully fine Peasgood's Nonsuch; J. Hargreaves, Esq., 2nd, with Lord

Suffield; and Mr. J. Nicholson, 3rd, with Peasgood's Nonsuch.

For three distinct dishes of dessert Apples, Sir J. Pease was 1st, with Jefferson's Worcester Pearmain and Gravenstein; J. Hargreaves, 2nd, with Irish Peach and Red Astrachan; and C. Lee Campbell, Esq., Ross, Herefordshire (gr., S. J. Wright), 3rd.

Messrs. T. Rivers & Son, were again 1st for one dish of dessert Apples, showing excellent specimens of Cox's Orange Pippin; Sir J. Pease, 2nd, with Ribston Pippin; and Lord Stanhope, 3rd, with Lady Sudeley.

Pears.—Messrs. T. Rivers & Son, took the 1st prize for three distinct dishes, with Souvenir du Congrès, Clapp's Favourite, and Williams' Bon Chrétien; 2nd, Mr. J. Nicholson; and 3rd, Sir J. Pease.

For one dish, Messrs. Rivers were again 1st, showing Pitmaston Duchess; Messrs. Rothschild (gr., Geo. Reynolds), 2nd, with Clapp's Favourite; and 3rd, Sir J. Pease, with Souvenir du Congrès.

Tomatos.—For six distinct dishes of Tomatos, the 1st prize fell to Mr. Ed. Ryder, for Optimus, Ignotum, Ham Green, Stamfordian, and Golden Favourite; Mr. J. Hill, New Maldon, was 2nd, with Sutton's Perfection, Conference, Trophy, Ham Green, and Challenger.

For three dishes of Tomatos, there were nine entries, Mr. J. Roberts, Shepperton, being 1st, for Webbs' Jubilee, The Cardinal, and Early Ruby; C. Boyer, Esq., Forest Hill (gr., J. Bury), 2nd; and Messrs. W. & E. Wells, 3rd.

For one dish of yellow Tomatos, Mr. Ed. Ryder was 1st, with Golden Sunrise; C. Boyer, Esq., 2nd, with Sutton's Golden Perfection; and Captain Ed. Pinner (gr., Jas. Fry), 3rd, with Blenheim Orange.

Mr. Jno. Hill, New Maldon, was 1st for one dish of red, showing Sutton's Perfection; Mr. J. Roberts 2nd, with Webbs' Jubilee; and Mr. J. Dawes 3rd, with Ham Green. Some very large fruits of Royal Sovereign, from Mr. Gilbert, Burghley, failed to score.

MISCELLANEOUS AND NON-COMPETING EXHIBITS.

At the end of one of the rooms were a few large Palms, staged by Messrs. Wills & Segar; and in the front of these a large and magnificent group of double and single Begonias, staged by Messrs. Laing & Son, Forest Hill, which was awarded a Gold Medal. This was the finest group we have seen this season; both the arrangement and the quality of the plants left little to be desired. The best of those staged were the following, all of which received First-class Certificates:—Mrs. French, Lady Theodora Guest, Lady Grimthorpe, Lord Esher (a large double), Duchess of Teck, Henshaw Russell, and Stanstead Gem, another lovely scarlet.

Messrs. Wm. Paul & Sons received a Silver-gilt Medal for a group of Peaches, Nectarines, and Figs, in pots, in very fine condition; the Peaches were left unpruned, illustrating on a small scale the extension system of growing fruit trees. Messrs. J. Cheal & Sons, Crawley, a Silver Medal for cut flowers of Dahlias, &c. Mr. J. F. McLeod, gr. to J. S. Morgan, Esq., Roehampton, staged a very pretty group of Crotons, intermixed with Ferns, and other dwarf foliage plants. The plants were exceptionally well-coloured, dwarf, and in small pots. Amongst the best of them were Thompsoni, with almost the whole of the broad leaf a bright gold colour; C. chrysopœcilis, another of the finest of the broad leaf section (Silver-gilt Medal).

Messrs. E. D. Shuttleworth & Co. had a large group of Palms, Crotons, Dracenas, Liliams, &c., in fine condition, at the end of one of the rooms, and were awarded a Gold Medal. Mr. Wythes, gr. to the Duke of Northumberland, showed a pretty group of *Campanula pyramidalis* in bloom, and was awarded a Silver Gilt Medal. Mr. McMillan, gr. to Jas. Currie, Esq., a collection of *Chrysanthemum* blooms (Bronze Medal). Messrs. Cannell & Sons, Swanley, a fine stand of *Dahlia* (Cactus) blooms, and some very good *Cannas* (Silver-gilt Medal). Another collection of Dahlias came from Mr. C. Turner, Slough, and included some very fine show blooms; also a collection of herbaceous Sunflowers, Roses, &c. (Silver-gilt Medal). W. Marshall, Esq., Auchinraith, Bexley, sent a fine collection of hardy Ferns in pots, including the specimen *Polypodium vulgare* var. *trichomanoides*, which was awarded the prize for the best Fern exhibited at the Fern Conference at Chiswick last week (Gold Medal). The same exhibitor obtained a First-class Certificate for his *Begonia Madame Alcaing*. An extra prize was awarded Mrs. W. Hodgkins, Didsbury, for a stand of ornamental skeletonised leaves. Messrs. Kelway & Son, Langport, staged a magnificent collection of

Gladiolus, and obtained a Silver-gilt Medal and five Certificates.

Messrs. J. Veitch & Sons showed sprays of ornamental shrubs and trees, including *Hydrangea quercifolia*, *Quercus cuspidata*, *Q. pedunculata concordia*, *Cydonia japonica* bearing fruit, *Cornus alba Späthii* (First-class Certificate), *Castanea vesca dissecta*, &c. Also Seedling *Streptocarpus* (First-class Certificate) and *Rhododendron javanicum* *jasminiflorum* hybrids, some of which secured First-class Certificates, viz., *Minerva*, *Souvenir de J. D. Mangles*, *Ruby*, *President*, and *Imogene* (Silver-gilt Medal).

Messrs. Wm. Paul & Son, Waltham Cross, a large collection of cut flowers of herbaceous plants; also *Roses*, *Dahlias*, &c. (Gold Medal).

Messrs. Herb & Wille, John's Hill, E.C., staged an interesting collection of Pine cones of some number of species. The nomenclature, however, required revision (Silver Medal).

Messrs. Webb & Brand, Saffron Walden sent a lot of single blooms of Hollyhocks, and obtained a Bronze Medal.

Mr. J. Hudson, gr. to Messrs. Rothschild, Gunnersbury House, showed a fine lot of specimen *Pelargoniums* (scented varieties), and was awarded a Gold Medal. Also a specimen of *Asparagus deflexus* (First-class Certificate). Mr. J. R. Chard, Stoke Newington, was awarded a Silver Medal for his Arcadian decorations. Messrs. J. Laing & Sons, a very large collection of herbaceous flowers (Silver Gilt Medal). Mr. Arthur Rawlings, Dahlia Nursery, Romford, Essex, a collection of show Dahlias, *Pompons*, &c. (Silver Gilt Medal). Messrs. Wm. Cutbush & Sons, Highgate, a collection of herbaceous plants (Silver Medal). Mr. G. Reynolds, gr. to the Messrs. Rothschild, obtained First-class Certificate, for a new seedling *Carnation*, *Madame Leopold de Rothschild*. Messrs. T. Rivers & Son, Sawbridgeworth, showed some fruit trees in pots, including Pears, Apples, Plums, Peaches, and Nectarines. The trees were exceedingly healthy, and carrying fine crops of fruits. This was awarded a Gold Medal. Mr. W. Shingler, Melton Constable, exhibited a new Grape (black), *Lady Hastings*. Messrs. Jarman & Co., Chard, Somerset, sent a very extensive collection of vegetables, including fine Celery, Potatoes, Onions, &c.; also of fruits, amongst which were two heavy bunches of Black Hamburg Grapes, a dish of first-class Cherries, &c. (Two Silver Medals). Messrs. H. Lane & Son, Berkhamstead, received a Gold Medal for an excellent lot of pot Vines, bearing good bunches of ripe fruit: the varieties included Black Hamburg, Alicante, Buckland Sweetwater, Foster's Seedling, and Gros Maroc; also a collection of fruits of Apples, Nuts, Plums, &c. A few good smooth Cayenne Pines came from the Duke of Newcastle, Worksop (gr., Mr. C. Slade) (Silver-gilt Medal).

Messrs. Collins, Bros., & Gabriel, Waterloo Road, London, S.E., received a First-class Certificate for their new Tomato, *Collins' Challenger*, said to possess wonderfully good flavour. For a collection of spring-sown Onions, Mr. J. Gibson, The Oaks, Carshalton, was awarded a Bronze Medal; they were exceptionally fine and firm, especially a variety called *Rousham Park*. A collection of very fine Apples, in twenty-four varieties, came from Mr. J. Walker, Ham, Surrey, Duchess of Oldenburgh and Lady Sudeley being especially good (Silver-gilt Medal). Messrs. J. Cheal & Son, Lowfield Nursery, Crawley, exhibited a collection of Apple trees in pots, most of them cordons; also an immense number of fruits (Silver Medal). Messrs. Geo. Bunyard & Co., Maidstone, also had a large collection of Apples and Pears; of the latter, *Triomphe de Vienne*, *Souvenir du Congrès*, *Pitmaston Duchess*, and *Bourré de Amanlis* were very fine (Silver Medal). Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esber, had an ornamental basket of fruits, including some good Peaches, Melons, Grapes, Apples, &c. Mr. J. Wallis, gr. to R. Sneyd, Esq., Keele Hall, Newcastle, Staffordshire, exhibited Peaches *Walburton Admirable* and *Bellegarde*, also Lord Napier and Stanwick Elrige Nectarines, all very fine—grown under glass. Messrs. R. N. White & Co., Covent Garden, exhibited a collection of foreign fruits, as they had come packed to this country, and included Grapes from Spain and Portugal, Melons from Spain, Pears (good) from California, Peaches, Pears, and Plums from France, and Onions from Portugal and Spain (Silver-gilt Medal).

A large collection of finest English fruit, that had been sent to Mr. Geo. Monro, salesman, Covent Garden, was exhibited by Messrs. Butt & Son, in the condition in which they had arrived in London. Included were Grapes, Tomatos, Melons, Figs, Peaches, Pines, Plums, and Mushrooms, &c. (Gold

Medal). Mr. A. H. Rickwood, Twickenham, showed a collection of Peaches, and was awarded a Bronze Medal.

A quantity of rather poor Grapes were shown by Mr. J. Clarke, Albion Nursery, Farnham, as having been grown without fire-heat. They consisted of the more popular market varieties, and would have been better had the grower shown more mercy to his Vines and not let them bear forty-five to sixty bunches each.

NEW PLANTS.

The occasion was utilised by several nurserymen for exhibiting novelties in plants. Messrs. B. S. Williams & Son, Holloway, had *Pachystoma Thompsonianum*, a neat pretty species of Orchid, with white sepals and petals, and narrow lip of magenta colour, the side lobes of which are green, with brown spotting. It is a plant of dwarfish habit. *Angraecum grandiflorum*, a curiously tailed flower of green and white with a trough-like lip; several *Dracenas*, viz., *D. indivisa Veitchi variegata*, with leaves 2 inches wide, white and green, except at the base, where they are reddish; *D. H. E. Milner*, bronzy-green, in the old foliage creamy-white in the heart-leaves; *D. Miss Glendinning*, *D. Alex. Laing*, and *D. Mrs. Laird*, were narrow-leaved varieties of crimson and bronze; *Pandanus* condensans, narrow green leaves, with a brown edge and spines, semi-pendent in habit; *Cupania elegantissima*, a pretty foliage plant; *Carludovica palmata*, a free-growing subject, with a leafed stem, and numerous aerial roots; and several novelties in ornamental-leaved *Begonias*.

A table of new or noteworthy plants, of considerable merit, was contributed by Messrs. F. Sander & Co., St. Albans. A fine form of *Odontoglossum Roezli*, with triangular purple patches at the base of the petals; *Lælia elegans Schrodera*, *Vanda Hookera*, *Renanthera matutina*, not quite new, but a remarkably striking flower—a large well-bloomed specimen; *Cattleya Parthenia nobilis*, *Odontoglossum Wattianum*, figured recently in the *Reichenbachia*, a flower which seems to combine the features and colouring of several distinct species.

Several of Mr. Maynard's seedlings of *Cypripedium* were shown in this collection, some of them being very pretty, and all are distinct from anything at present in existence. We may mention the following: The *Waddesdon* variety of *Cattleya Schofieldiana*, *Vanda Sanderiana*, *Lælia Gravesii*, named after Mrs. Graves of New Jersey, and a result of a cross between *Cattleya crispa* and *Lælia purpurata*. It is a pretty thing, but it being the first flower on a plant flowering for the first time, its true characteristics are not developed.

In the evening a large party of gardeners dined together, under the presidency of Mr. William Thomson, of Clovenfords, who, in his speech gave an interesting retrospect of the condition of gardening and of gardeners for the last sixty years. He enlarged upon the salaries paid to high class gardeners, which are certainly very low in proportion to the forethought and responsibility exercised. The Secretary of the Royal Horticultural Society concurred in the remarks of Mr. Thomson, but did not say how matters could be improved, though indirectly, at any rate, the Society might do a great deal to raise the social position of gardeners and to secure a better education for beginners. The line between gardeners and garden-labourers needs to be drawn more clearly.

NEWCASTLE-ON-TYNE HORTICULTURAL.

AUGUST 24, 26.—After the disastrous event on the eve of the large summer show intended to be held last year, which resulted in its abandonment, it was no doubt a moot point whether the Society would resuscitate itself. That this has, however, been done is an undisputed fact, and the executive are to be congratulated upon the superior quality of the show, and also upon the ready response made to their appeals whereby they have been placed in a better financial position. The show was in all points an excellent one, and there were many indications of superior culture manifest in the exhibits.

Plants.—These were staged in considerable quantity. For eight stove or greenhouse plants in flower, Mr. Nicholas, gr. to the Earl of Zetland, Upleatham, was worthily placed 1st, with finely grown all round specimens, the best of which were *Dipladenia amabilis*, *Erica Austimiana*, and *E. ampullacea*, both about 4½ feet through, and very fresh; *Statiche profusa* in full bloom; *Bougainvillea glabra*, two capital *Allamandas*, with *Cypripedium Lawrenceana*, an extra large plant, with fifty or more grand flowers. Mr.

Wylam, Shankhouse, was a good 2nd, his finest plants being *Rondeletia speciosa* major, *Stephanotis floribunda*, and *Statisce profusa*.

With six plants in bloom, Mr. Morris, Felling, was easily 1st, he having a very fine example of *Ixora Williamsii*, some 5 feet through, and in profuse bloom; with good examples of *Lapageria alba* and *Stephanotis floribunda*. Mr. Wylam was again 2nd, showing, amongst other plants, a fine plant of *Erica retorta* major.

With both four and three *Ericas*, Mr. Nicholas was placed 1st, showing medium-sized plants, fresh, healthy, and in profuse bloom, these were *E. amula* Irbyana, *Aitoniana*, *Turnbulli*, *Austiniana*, and *Ne Plus Ultra*.

For eight fine-foliaged plants, Mr. McIntyre, gr. to Mrs. Pease, Darlington, was 1st, with large healthy plants, the best being *Croton Andreanus*, *Phoenix rupicola*, and *Cycas revoluta*; whilst for six plants, he was beaten by Mr. Nicholas, who staged a fine half-dozen, *Croton angustifolius* and *C. Queen Victoria* being particularly fine.

Exotic Ferns were very good from Mr. McIntyre in two classes, the best of these were *Davallia fijiensis*, two examples, each in fine health, and about 6 feet through; *Gleichenia dichotoma*, rarely exhibited; also a good healthy piece of *G. Mendelii*, with *Adiantum Farleyense* and *A. Veitchii*. Mr. McIntyre also had the best selection of plants for the dinner-table.

Cut Flowers.—Roses were remarkably fine. Those staged by Messrs. Harkness & Son, Bedale, were of full size, and fresh in colour, being quite equal to exhibits in the south during the first week in July. The finest blooms were Mrs. John Laing, Charles Lefebvre, Countess of Rosebery, Ulrich Brunner, and Marie Baumann. This exhibit was a splendid 1st; Messrs. Mack & Sons, Catterick Bridge, following. Messrs. Harkness also won with *Gladioli*, the spikes extra large; Grand Rouge, Baroness Burdett Coutts, Sceptre de Flore, and Opal, were the best. Mr. A. G. Brown, gr. to Mrs. Barnes, Whitburn, was 2nd.

Hardy herbaceous and border flowers were a feature, being shown in extra large bunches; the best eighteen kinds were those from Mr. J. G. Roe, Barnard Castle, amongst which were *Lilium chalcedonicum* and *Chelone barbata*; Messrs. Harkness & Son were 2nd, and included *Montbretia crocosmaeflora* and *Tigridia conchiflora*, with other good things. The best Dahlias were of shows, from Mr. Walker of Low Fell, and of fancies from Mr. Humphries, Chippenham, the latter exhibitor also being 1st for both Pompons and Cactus varieties. Mr. Thomas Flowdy, Gateshead, was 1st in two classes for florists' Carnations. Stove and greenhouse cut flowers were finest from Mr. Nicholas, who had a choice lot. Pansies and Marigolds were also shown in large numbers, and very fine.

Floral Decorations.—About a dozen classes were provided in this section, and the competition was very keen in nearly every case. Messrs. Perkins & Son, Leamington, were 1st for a beautifully-arranged hand-bouquet, also for the best spray and button-hole, each in their usual good style. For a bridal bouquet, they were beaten by Mr. W. R. Armstrong, Benwell, who also was 1st for a basket of cut flowers, with an exquisite arrangement. Mr. J. Lawson, Sunderland, showed well in other classes for bouquets; so also did Miss Edmondson, Newcastle, for a basket.

Fruit.—Taken throughout, the classes were well filled and the quality excellent. Mr. Hunter, Lambton Castle Gardens, was an easy winner in two classes for collections. In the larger class he staged extra fine Gros Maroc Grapes and Muscat of Alexandria, Royal George Peaches, smooth Cayenne Pine, and good Apricots and Jefferson Plums. In the other he had similar good fruit. Mr. Tullett, Raby Castle Gardens, was in each instance, 2nd, staging excellent produce, his best dishes being Madresfield Court Grapes, Pine-apple Nectarines, and Dymond Peaches.

For four dishes, Mr. Tullett was 1st, with fine Black Hamburgh Grapes, Peaches, and Nectarines; and for six dishes of hardy fruit, his Cherries and Gooseberries being the best of these. Mr. Hunter found a successful antagonist for six bunches of Grapes in three varieties, in Mr. Potter, gr. to W. Moore, Esq., Carlisle, who showed Alicante, Madresfield Court, and Muscat of Alexandria, all finely finished and good-sized bunches. Mr. Hunter's collection was scarcely up in colour. For Black Hamburgh, Mr. Atkinson, gr. to Sir E. Blackett, Bart., Matfen Hall, was 1st. Mr. Potter took 1st for Alicantes in good character, also for another black with Gros Maroc, being followed by Mr. Nicholas, with good

Madresfield Court. Muscat of Alexandria were much the best from Mr. Potter, the berries of extra size; he also took the 1st prize for Buckland Sweetwater in its class, and for the heaviest bunch with Trebbiano, having only size to recommend it.

The best Pine-apples came from Mr. Hunter, and from Mr. Blair, Trentham, but the latter, with his well-ripened Queen, should have been 1st. Mr. Nicholas was 1st for Peaches, with finely-coloured Hale's Early, grown outside. Mr. Tullett was 1st for Nectarines, with good Pine-apple. From the latter source also came the finest Cherries in Bigarreau Napoleon. Mr. Hunter had the finest dishes of four kinds of Apples, in both dessert and culinary classes, the kinds being Kerry Pippin, Jellerson, Worcester Pearmain, Gravenstein, Alfriston, Ringer, Lord Grosvenor, and Peasgood's Nonsuch, all evidently grown under glass. For four kinds of Pears, he occupied the same place, with Clapp's Favourite, Williams' Bon Chrétien, Doyenné du Comice, and Gregoire Bourdillon; and again for Plums, with White Magnum Bonum. Mr. Tullett had a fine dish of Tomatos, and was placed 1st.

Miscellaneous Exhibits.—These were chiefly from nurserymen, and greatly assisted in the general effect. Messrs. Harkness exhibited several boxes of Roses, notable amongst which some dozens of very fine blooms of Mrs. John Laing, of large size, very full, and bright in colour, were extremely good. Messrs. Jas. Robson & Sons showed well-grown Conifers and variegated shrubs. Messrs. Little & Ballantine staged a splendid group of fine foliaged plants at the end of one marquee. Messrs. Laing & Mather had a fine display of Carnation blooms, amongst which were several of the pink and blush Malmaisons, with Duke of Fife and Lady Nina Balfour, two good pink varieties. Mr. Cuthbertson showed a large number of herbaceous plants, and Mr. John Forbes, Hawick, Carnations and Pentstemons, Pansies, &c. Messrs. Stuart and Mein had Carnations; Messrs. Wm. Fell & Sons, a large group of Conifers, of large size; Mr. W. J. Watson, a fine group of hardy plants and flowers, Lilies, &c. Mr. Handysides showed very large Tomatos.

DEVON AND EXETER HORTICULTURAL.

AUGUST 19.—The annual summer exhibition of this Society was held as usual on the grounds of Northernhay, by permission of the Mayor and Council of the City of Exeter, and was in every way a success but the weather, visitors arriving from all parts of the county. The exhibits were not quite so numerous as last year, but the quality throughout was as good, and especially fine were the exhibits of vegetables. Considering that this county has suffered from a long period of drought, it was much to be wondered at that such excellent productions were possible. A greater amount of space for the exhibits was found than on previous occasions, when overcrowding was a great evil, and the extra amount of space conduced to the more effective arrangement of the exhibition.

Cut Flowers (Open).—For forty-eight Dahlias, double distinct, there was only one competitor, that being Mr. Geo. Humphries, who was deservedly awarded 1st prize. His collection included the best of the old and modern varieties of the flower.

For forty-eight *Gladioli*, distinct, 1st, Mr. G. Hawkins, gr. to W. H. Fowler, Esq., Taunton, who had a splendid lot of good flowers, including several seedlings of great merit.

General Prizes.—For twelve stove and greenhouse plants, six in flower and six foliage, distinct, 1st, Mr. Rowland, gr. to W. Brock, Esq., with healthy and good specimens of *Rondeletia speciosa* major, *Stephanotis*, *Dipladenia amabilis*, *Clerodendron*, *Ixora Williamsii*, *Dipladenia Brearleyana*, *Kentia Fosteriana*, *Crotons* *Disraeli* and *Andreas*, *Lantana borbonica*, *Anthurium Warocqueanum*, and *Cycas revoluta*; 2nd, Mr. Thos. Wilkins, gr. to Lady Theodora Guest.

For six stove and greenhouse plants, three in flower and three foliage, Mr. Rowland was 1st, with some equally good plants of *Stephanotis*, *Ixora Dixiana*, *Dipladenia amabilis*, *Dicksonia antarctica*, *Croton Queen Victoria*, and *C. Johannis*.

For six stove and greenhouse flowering plants, Mr. Rowland was again placed 1st with excellent specimens of *Ixora Prince of Orange*, *Bougainvillea glabra*, *Clerodendron*, *Dipladenia hybrida*, and *Ixora princeps*.

For eight stove and greenhouse Ferns, distinct.—1st, Mr. Rowland, with beautiful healthy specimens of *Leucostegia imensa*, *Adiantum cardiocladia* and

assimile, *Davallia elegans*, *Dicksonia antarctica*, *Neottopteris nidus*, *Actiniopteris radiata*, *Microlepia birta-cristata*.

For a miscellaneous collection or group of plants arranged for effect in an oval in a diameter of 12 feet by 16 feet, Mr. Rowland secured the 1st prize, with a fine and well-arranged group, which consisted of *Cocos plumosa*, *Humea elegans*, *Crotons*, *Crinum*, *Celosias*, *Eucharis*, *Ixoras*, *Cyperus*, *Vallotas*, *Tuberose*, *Orchids*, *Gloxinias*, grasses of various light kinds, with a groundwork of Maidenhair Ferns, the whole being surrounded with *Panicum variegatum*; 2nd, Mr. Thos. Wilkins, whose plants were set up in good style.

For a group, 12 feet by 8 feet.—1st, Mr. A. C. Williams, gr. to W. C. Sims, Esq.; 2nd, Mr. F. Prothero, gr. to W. McKenzie, Esq.

For six *Fuchsias*.—1st, Mr. Rowland, with large and well-flowered specimens.

For six *Gloxinias*, Mr. Heath, gr. to Sir W. Walrod, was 1st.

For twenty-four Dahlias, double, distinct: 1st, Mr. J. Nation, with a splendid stand of popular varieties.

For twelve Roses, distinct, 1st, Mr. G. Hawkins, with very fine flowers for the season, of Ernest Metz, Innocente Pirola, Anna Olivier, La France, Comtesse de Nadailac, Souvenir d'Ami, Madame Margottin, Catherine Mermet, Mias G. Brownlow, Sunset, Cleopatra, and Bride.

Fruit.—For a collection of fruit, ten dishes, distinct: 1st, Mr. J. Lloyd, gr. to Vincent Stuckey, Esq., with grand bunches of Muscat and Black Hamburgh Grapes, Melon Hero of Lockinge × Longleaf Perfection, Queen Pine, Bellegarde Peaches, Pine Apple Nectarines, Red Astrachan Apples, Brown Turkey Figs, Morello Cherries, and Greengages. 2nd, Mr. A. E. Crossman, gr. to J. Brutton, Esq.

For a collection of fruit, six dishes, distinct, Mr. Heath was 1st, with Alnwick Seedling Grapes, Beurré d'Amanlis Pear, Grosse Mignonne Peaches, Violette Native Nectarines, Sutton's Triumph Melon, and Apricot Moor Park. 2nd, Mr. Martin, gr. to Lord Poltimore.

For one Pine-apple. 1st, Mr. S. Lock; 2nd, Mr. W. Snell, gr. to Colonel Garratt.

For three bunches of Black Hamburgh Grapes. 1st, Mr. R. Pike, gr. to the Rev. H. Clerk.

For three bunches of Muscat of Alexandria. 1st, Mr. Martin, with splendid bunches and rich colour.

For three bunches of Madresfield Court Muscat. 1st, Mr. R. Pike. For three bunches of Foster's Seedling: 1st, Mr. W. Connelly. For three bunches of Buckland Sweetwater: 1st, Mr. G. H. Copp. For three bunches of any other variety: 1st, Mr. R. Pike, with Trentham Black.

Our space does not admit of our mentioning the names of the prize winners in the competitions with dishes of hardy fruits, Melons, &c.

Vegetables.—For a collection of vegetables to consist of twelve kinds distinct, 1st, a Silver Cup, value £5, given by Messrs. R. Veitch & Son, Exeter. This was awarded to Mr. R. Mairs for a collection. He also received the prize offered for the best-arranged collection; it included Sutton's Prize Winner Runner Beans, Turnip Dobbie's Model White, Leek Renton Monarch, Cauliflower Veitch's Autumn Giant, Brussels Sprouts Veitch's Exhibition, Tomato Ponderosa, Titan Onion, Potato Satisfaction, Carrot Veitch's Intermediate, Pea Duchess of Albany, Celery Dobbie's Invincible White, and Cucumber Sutton's Matchless; 2nd, Mr. G. H. Copp, also with a grand collection.

Nurserymen's Collections.—Messrs. R. Veitch & Sons, staged a magnificent lot of Carnation blooms, including most of the new varieties, as well as the best of the old varieties, having some of the best, *Lilian*, *Annie Douglas*, *Old Coin*, *Victory*, *Adèle*, *Mr. A. Barret*, *Countess of Jersey*, *Germania*, &c. Boxes of *Phloxes*, *Roses*, *Gladioli*, *Dahlias*, *Stocks*, herbaceous flowers, were also staged, and backed up with a beautiful collection of *Palms*, *Japanese Maples*, *Orchids*, &c.; and in the centre, a beautiful and skilfully arranged piece of rockwork was executed, and planted with all the choicest and most suitable of plants and flowers, made up a most charming and unique collection. Mr. W. Smale, Torquay, staged a grand lot of double and Cactus Dahlias, Hollyhocks, &c. Mr. Randall, Exe Bridge, staged a fine bank of grown decorative plants with boxes of seasonable flowers. Messrs. Jarman & Co., Chard, showed capital boxes of Carnations, *Roses*, *Dahlias*, *Gloxinias*, &c. Mr. Godfrey, Exmouth, boxes of Carnations. H. D. Badcock, Otley St. Mary, *Begonia* single and double blooms. Mr. H. W. B. Schofield,

staged forty varieties of Sweet Peas, which were much admired.

Mr. Box sent a fine lot of single and double blooms from Croydon. Mr. G. Kerswill, of the Bowhill Nurseries, staged a large group of handsome Palms, Crotons, &c., for decorative purposes.

BRIGHTON AND SUSSEX NEW HORTICULTURAL.

August 30, 31.—The first summer show held in Brighton under the auspices of the "New" Society, took place on Tuesday and Wednesday last in the Dome and Corn Exchange of the Royal Pavilion, and augurs well for the future success of the Association. There were between 600 and 700 exhibits,

(80 square feet), brought out several competitors, Mr. G. Miles, Victoria Nurseries, Dyke Road, Brighton, was easily 1st; he used an arrangement which had a grotto clothed with Ferns in the background, and in the front, a small Tree Fern on a mound. Messrs. W. Miles & Co., of West Brighton, to whom the 2nd prize was awarded, had a tasteful arrangement of the ordinary style.

From the gardens of J. Warren, Esq., Handcross Park, Crawley, came the finest specimen stove and greenhouse plants, those in the class for twelve, six to be flowering, being specially good, *Lapageria rosea*, *L. r. splendens*, *Cycas revoluta*, and Crotons of large size being conspicuous; the same exhibitor also showing well in the class for six Crotons, where he again led. Messrs. E. D. Shut-

four show and fancy; again for twelve do., with finely-formed blooms; for twenty-four bunches single vars., and twelve Cactus vars.; they were also awarded leading honours.

The competition for 1st was very close indeed in the class for Cactus vars., and Mr. E. V. Seale, Sevenoaks, almost secured the lead; and he beat Messrs. Cheal, with Pompones in bunches, showing an excellent lot.

In the class for forty-eight, show or fancy, the premier collection was sent by Mr. G. Humphries, nurseryman, Kingston Langley, Chippenham. They were a finely-finished lot of popular varieties, and led easily.

Roses were poorly represented, the weather having told on them considerably. Mr. Woolland, nurseryman, Cocksbridge, showed the best twenty-four, in medium-sized blooms of popular varieties; and Mr. Harris, gr. to Mrs. Eversfield, Denne Park, Horsham, won prizes in the smaller classes.

In the smaller cut-flower classes, competition was well sustained, on the whole, some of the most noteworthy contributions being a box of cut stove and greenhouse flowers, from Mr. W. Archer, gr. to Miss Gilsens, Hill House, Saffron Walden; and from Mr. G. Duncan, gr. to C. F. Lucas, Esq., Warnham Court, Horsham, who respectively received 1st prize in the classes for twenty-four and twelve vars.; and that from Mr. M. Pritchard, nurseryman, near Christchurch, who was a good 1st with herbaceous flowers, including *Gaura Lindheimeri*, *Gaillardias*, *Tritomas*, *Liliums*, &c.

Perhaps the strongest competitions were to be seen in the single dish and smaller fruit classes, into details of which we cannot enter, however. In the leading class, for a collection of eight dishes, Mr. G. Reynolds, Gunnersbury Park, Acton, was a good 1st, staging magnificent *Groa Maroc* and *Muscad* of Alexandria Grapes, *Clapp's Favourite Pear*, *Brown Turkey Fig*, *La Grosse Sucrée Strawberry*, *Sea Eagle Peach*, a Melon, and a Pine, all uniformly well finished. The 2nd place was accorded to Mr. G. J. Sage, Ham House, Richmond, Surrey, with good Black Alicante Grapes.

In the class for black Grapes (three bunches), Mr. Reynolds led easily, again showing *Maroc*, but competition ran close for the other places; Mr. J. Spottiswood, Queen's Park, Brighton, being 2nd, with the same variety.

With fine *Madresfield Court*, Mr. Webster, gr. to Dr. Kirby, Beckenham, led in the single bunch class. Mr. Reynolds again led for white Grapes; and Mr. Coleman, gr. to — Henderson, Esq., was 2nd, with *Muscad* of Alexandria, the premier lot being finely coloured. Peaches, were decidedly good, Mr. R. Potter, gr. to Sir M. W. Collett, Bt., Sevenoaks, led. Mr. Duncan was 1st for *Cherries* in a very close and large competition. Mr. Harris had best *Greengages*, and Mr. J. Didman the finest *Plums*.

In the vegetable classes it is to be regretted that some of the best collections were not set up in accordance with the terms of the schedule, and as a consequence were disqualified. Mr. W. Manton, gr. to Mrs. Clifford Borner, Picknell, Bolney, was a very successful exhibitor in several classes; and Mr. G. Sheppard, Pullborough, also showed well. Potatoes, Beet, &c., were numerous and well shown by several exhibitors.

Non-competitive groups came from Messrs. Balchin & Son, Hassock's Gate; E. D. Shuttleworth & Co., London; and J. Cheal & Sons, Crawley; the latter comprising fruiting Apple trees in pots as well as dishes; and from Messrs. W. Edwards & Sons, Sherwood, a novelty in decorative pottery, &c., very suitable for Ferns. It is a rough surface, blackened and touched with bronze-gold, and very effective.

A word of commendation to the executive; the entry cards in all classes had the exhibitor's name and address printed, which was a great facility to us in securing our notes.

A SELF-WATERING PLANT-SHELF.

A DEVICE is being advertised in our columns by Mr. S. Deards, of Harlow, for supplying with water plants growing in pots, and standing in hot dry positions, such as the back shelves in forcing-houses. The troughs, which are made of metal with a corrugated bottom, on which the pots will stand, can be supplied with water by means of a hoseor pipe to the depth of several inches, which obtains access to the

FIG. 49.—DEARD'S SELF-WATERING SHELF: END VIEW.

FIG. 50.—DEARD'S SELF-WATERING SHELF: SIDE VIEW.

and good quality was the rule. The plant classes were well sustained, and groups for effect were a feature. The first place for a miscellaneous group arranged for effect, space not to exceed 100 sq. feet, was won by the collection from Mr. Peel, gr. to Miss Todd, Sidford Lodge, Southampton, whose bright arrangement was very charming, *Lobelia cardinalis* and *Tuberose*s being conspicuous. Mr. J. Turner, gr. to Sir G. Smyth, Wick Hall, Furze Hill, followed closely, with a heavier arrangement and larger plants.

In the class for the smaller groups, Mr. E. Meachin, gr. to Mrs. Armstrong, Woodilee, Withdean, led, his group containing some fine *Lilies* and *Dracenas*.

The class for a group of Ferns arranged for effect

Shuttleworth & Co., Peckham Rye, London, being a good 2nd. The 2nd place in the class for twelve stove plants fell to Mr. T. Portnell, gr. to Sir A. Lamb, Bart., Beauport, Battle, while in the class for six specimen stove and greenhouse plants, Mr. W. Jupp, gr. to G. Boulton, Esq., Torfield, Eastbourne, was a fair 1st, with some fine Crotons in his collection. The best specimen ornamental foliage plant was a finely-grown *Croton Weismanni*.

In the cut-flower section, competition was closer generally than in the plant classes, *Dablias* forming the chief feature, which were finely shown by Messrs. Cheal & Sons, Lowfield Nurseries, Crawley, in all sections; and they were easily 1st for twenty-

pots through the hole at the bottom, capillary attraction carrying the moisture to the upper portion of the ball. Various advantages are claimed by the inventor for his device, but we offer no opinion, not having tested it.

TRADE NOTICE.

HAMPTON HORTICULTURAL COMPANY (LIMITED).

This Company was registered on the 25th ult., with a capital of £3800, divided into 760 shares of £5 each, to carry on in Great Britain, Ireland, and elsewhere, the trade or business of Florists, Nurserymen, Farmers, and Gardeners, or Merchants of flowers, fruit, vegetables, &c. Registered by Nash & Co., 12, Queen Street, London, E.C.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, and BRIGHT SUN. Rows list districts 0-14 and their corresponding weather data.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending August 27, is furnished from the Meteorological Office:—

"The weather during this period varied considerably. Over eastern, southern, and central England, there were considerable intervals of bright sunshine; but, in the western and northern parts of the Kingdom the conditions were generally very cloudy or dull. Rain occurred from time to time in all places; occasionally accompanied by thunder and lightning. The rainfall experienced in Ireland during the earlier days of the week, and over the south of England at its close, was very heavy.

"The temperature exceeded the mean in all districts, the excess in most cases being 2° or 3°. The highest of the maxima were recorded during the early part of the period, when they ranged from 82° in 'England, E.' and the 'Midland Counties,' and 86° in 'England, S.' to 75° in 'Ireland, S.' and 71° in 'Ireland, N.' The lowest of the minima were registered at most stations on the 22nd, and ranged from 43° in 'Scotland, N.' 'England, S.' and 'Ireland, N.' to 32° in the 'Channel Islands.'

"The rainfall was rather less than the mean in 'Scotland, E. and W.' and in 'England, N.E.' but, more in all other districts; the excess over Ireland and the south and east of England being very considerable.

"The bright sunshine exceeded the mean over the greater part of England, but showed a deficit elsewhere. The percentage of the possible duration ranged from 49 in 'England, E.,' 48 in the 'Channel Islands,' and 45 in the 'Midland Counties,' and 'England, S.,' to only 23 in 'England, N.W.,' 24 in 'Ireland, N.,' 21 in 'Ireland, S.,' and to 18 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, September 1.

TRADE very depressed; all classes of goods with difficulty cleared at very low rates. James Webber, Wholesale Apple Market.

Table of CUT FLOWERS—AVERAGE WHOLESALE PRICES. Lists items like Arum, Asters, Carnations, etc. with prices.

Table of FRUIT—AVERAGE WHOLESALE PRICES. Lists items like Apples, Grapes, Kent Filberts, etc. with prices.

Table of PLANTS IN POTS—AVERAGE WHOLESALE PRICES. Lists items like Adiantum, Aspidistra, Ferns, etc. with prices.

Table of VEGETABLES—AVERAGE RETAIL PRICES. Lists items like Artichokes, Beans, Beet, Carrots, etc. with prices.

CORRECTION—ORCHID CALENDAR.—In our last issue, p. 243, see par. beginning, "Lycastes, and especially L. Skinneri," leave out not; also Vanda cœrulea should not be watered twice daily, but the aerial roots should be sprinkled twice daily.

CYCLAMEN: Davis. We fail to find either fungus or insect. The decayed corms are the result of faulty treatment.

DUTCH BULBS FOR SPRING DISPLAY OUT-OF-DOORS: A. B. Narcissus, Crocus, Chionodoxa, and Scillas, may be planted in September; Tulips and Hyacinths in October. You should ascertain from the nurseryman from whom the bulbs are purchased, for those varieties of the last two, that will bloom at the same time when planted at one time, or you will have gaps in the display. Depend mostly on single-flowered Hyacinths and double-flowered Tulips, these being more enduring than single-flowered, if not quite so showy. If the display is not for one short period, plant at intervals of a month or rather less, up to the end of the year. Ranunculus and Anemones may be planted in fine weather in February and onwards.

GARDENING PAPERS: M. W. Irish Farm, Forest, and Garden, published at 67, Middle Abbey Street, Dublin; Irish Farming World, devotes all its pages to gardening, published by J. Macdonald, 33, Dame Street, Dublin; Farming World, published by J. Macdonald, 63, Princes Street, Edinburgh.

GRAPE: D. W., Rotherham. Your berries are affected with a disease, commonly known as "spot." It is caused by a fungus (Gloeosporium laticolor), and has been known in this country for forty years. All that is yet known concerning the malady was described in our issue for May 6, 1890, accompanied by a figure of the fungus. The best and most natural cultivation is the only weapon to fight against this pest. Destroy by fire all affected berries.

HENBANE (HYOSCYAMUS NIGER): H. S. W. A widely distributed plant, grown for medicinal purposes; its dispersion being due probably to man's agency. To grow it, a warm spot and light sandy or gravelly soil should be selected. It might be sown in drills made 18 inches apart, the seeds being dropped at 15 inches apart, thinning these out to one, the strongest. Sow in the months of March or October. Keep the ground clean by hoeing. If grown in a small way, seeds might be sown in a cool frame in March, and the seedlings transplanted in May after due hardening. These would be probably early in maturing. It is a method that would suit your county (Yorkshire). For seed, try Jas. Carter & Co., High Holborn, W.C.

MAIDENHAIR: E. K. The black spots are the spores-cases of a fungus, Pilobolus, which will do no harm, though they look unsightly.

NAMES OF FRUITS: R. C. Apple, Duchess of Oldenburg.—R. N. Plums: 1, Victoria; 2, Bradshaw; 3, Nectarine; 4, Pond's Seedling; 5, Prince of Wales; 6, Magnum Bonum.

NAMES OF PLANTS: Scarborough, Portulacca Gilliesii.—H. H. 1, Verbascum sps.; 2, Solidago canadensis; 3, Bocconia cordata; 4, Spiraea Fortunei; 5, Lamium purpureum; 6, Euphorbia Lathyris; 7, Piptanthus nepalensis.—R. P. Hypericum Androsimum.—J. D. 1, Polygonum persicaria; 2, Polygonum aviculare; 3, Spargula arvensis.—J. C. H. Liliun longiflorum.—J. S., Maidenhead. Salvia pratensis.—J. H. The Publisher has nothing to do with such matters; address the Editor. 1, Cyperus sp.; 2, Solidago virga aurea; 3, Spiraea sp.; 4, Campanula latifolia; 5, Spiraea filipendula; 6, Gentiana saponaria.—J. B., Wavertree. Cattleya Dowiana, and Laelia elegans Schilleriana.—E. M. C., Kingstown. Pholidota articulata.—A., Hoddom. Dendrobium Chrysanthum.—M. S. D. 1, Pyrus sambucifolia, the American variety of the Mountain Ash; 2, Crataegus Crus-galli; 3, Spiraea arifolia; 4, Amelanchier vulgaris; 5, Adiantum hispidulum.—A. B. C. 1, Spiraea Thunbergii; 2, Olearia laastii; 3, Pyrethrum, garden variety; 4, Harpalium rigidum; 5, Chelone obliqua; 6, Potentilla, garden variety; 7, Spiraea Fortunei.

PELARGONIUMS: Subscriber. Pyramidal zonalis are obtained by growing plants for several years' Good one-year-old plants, cut back about August, should be kept moderately dry at the roots until they begin to break, when they may be shaken out and potted into smaller pots to be treated afterwards as young plants, and potted on when they require it; all that is then required is to see to

NOTICES TO CORRESPONDENTS.

AFFECTED LEAVES: C. S. We should say that moisture must have lodged in the hearts of the Cypripediums to cause the appearance shown in the leaf sent. Syringe the Criumns frequently with a weak decoction of Quassia chips, sponging them frequently with the same liquid.

ASSESSMENT OF GREENHOUSES: P. & Sons. They come under trade appliances, and should not be assessed at all.

BOOKS: H. S. W. Kitchen and Market Garden, Macmillan & Co., London. Mushroom for the Million, J. Wright, 171, Fleet Street, London. Fruit Growing for Profit, G. Bnyard, Old Nurseries, Maidstone.—A. B. The Agricultural Text Book, by John Wrightson (W. Collins, Sons, & Co., London and Glasgow).—W. B. W. H. & E. Albert, 17, Gracechurch Street, E.C.

BULBS FOR PLANTING OUTSIDE AND INSIDE: W. H. M. Consult a nursery list. The names would occupy too much of our space.

CAMELLIAS FLOWERING IN AUGUST: J. M. S. It is not a rare occurrence on plants which made their flower buds at a very early part of the season; but, if the plants are kept cool and plenty of air is afforded them, if they are indoors, not many buds will expand before the usual season of flowering.

the training, and keep them well supplied with nutriment, and partially resting them each winter. The Ivy-leaved varieties may be raised from cuttings in the spring, which should be then grown on throughout the summer, and wintered in a temperature of about 45°. The following season they should be pretty large specimens, and if attention has been paid to the training, they will be good pyramids. The culture of Heliotropes is precisely similar to that of the Ivy-leaved varieties of Pelargoniums, and they are nearly sure to bloom during the London season.

PICOTEE BED: *Brighton.* The position of the bed should be sunny and unshaded by trees and tall buildings, and it is better to have a hedge or wall as a protection on the east and north sides. It should consist of loam well enriched with some rotted manure from the cow-house, or old hot-bed stuff. Nothing rank, fresh, or strong, such as pigs, dogs, chickens, or pigeons' dung should be used, unless it be two or three year old. The bed should be deeply stirred, and if the soil is of a rather close texture, sharp sand, or the scrapings of gravelly or flinty roads should be mixed with it. It should have a slope 2 inches to the foot run, and be slightly raised above the surrounding soil. Prepare the bed in September if for autumn planting, allowing time for the soil to settle somewhat; and stir the surface with a hoe or fork, several times at intervals of a week. Planting may be performed in October after levelling and treading the soil evenly. In smoky towns and northern counties, growers often winter their plants in cold frames, and plant out at the end of winter; but this would not be needed in a seaside place. Plant from 12 to 15 inches apart, according to strength of varieties.

PRUNING PYRAMID APPLE, PEAR, AND PLUM TREES: *Beta.* The new gardener is doing the proper thing—the continual summer-pinning of shoots has fallen into disuse generally, as it was found to soon cripple the trees. Let the gardener keep the branches thin, that is, permit no crowding; practice a certain amount of shortening back in July, and closer pruning in the winter, of course observing, when doing this, the various peculiarities of varieties—some producing their fruit on long, some on short shoots; some having weak growth, needing harder cutting-in at the winter pruning; some being erect in habit, easily getting crowded in the centre; whilst others are inclined to make spreading heads, or are of a pendulous habit. The extension method is, doubtless, the best, because it is the most natural to the trees, but it demands a good deal of room, and suits bushes and standards better than pyramids.

QUEACUS: *T. J. S.* *Quercus robur* var. *sessilifolia*.

SEASIDE PLANTING: *Novice.* Front lines, Tamarisk, Blackthorn, Travellers' Joy, as a binding together plant; behind these plant Sycamore, Crab, Elder, Austrian Pine, and Pinus Pinaster; and farther inland, Scotch Pine, Oak, Beech, Abies Pinsapo, Abies cephalonica, and the Yew, a plant that does well on chalk, as do the two species of Abies named. With the amount of protection provided by the above, if planted in a belt of 100 yards wide, or two belts 100 yards apart, anything will grow.

RAINFALL OF 1892 IN THE MIDLANDS: *Nemo.* The rainfall has been below the normal for more than 12 months over the greater part of England. What the amount is that has fallen in the Midland districts is unknown to us. Enquire at the Meteorological Office, Victoria Street, Westminster.

SEEDLING CARNATION: *B. B.* In colour very beautiful, in size large, and form somewhat loose, in fragrance faint; but still, a desirable variety.

TOBACCO JUICE: *A. E. H.* The quantity will vary with the strength of the juice. Strong juice may be used at the rate of ½ pint to the gallon of water, whilst another sample would allow of 1 pint being added. Test it for yourself.

The **GREATEST NOVELTY** of the AGE!

SAM DEARDS' PATENT SELF-WATERING SHELF FOR PLANTS ON SHELVES.

Now on view at Stand 11, Block A, Horticultural Exhibition, Earl's Court, S.W.

- ITS ADVANTAGES ARE—
- 1st.—No waste of water, all water being absorbed by the plants.
 - 2nd.—Saving of three-fourths of the labour in watering.
 - 3rd.—The plants are watered more naturally than by any other method.
 - 4th.—All drip and water dropping from shelves to plants beneath entirely prevented.
 - 5th.—Not a drop of moisture-water is lost, all being absorbed by the plants.
 - 6th.—A boy can do the work of a man.
 - 7th.—A row of plants 100 yards long can be watered without walking a yard to do it.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"
ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for terms. **SPECIMEN FREE. Price 2d.** Published Friday for Saturday.

Seed Trade.

SHOPMAN.—Age 30; fourteen years' practical experience, desires re-engagement.—D. STRACHAN, 42, Oak Street, Abingdon.

SHOPMAN.—Age 25; upwards of ten years' experience in all branches of the Trade. Good references.—B. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SEED TRADE.—Situation wanted as SHOPMAN age 24.—Thorough knowledge of German.—F., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

CLERK.—Age 23; experienced; seeks situation in a Nursery. The Province not objected to. Good reference from present employer.—NURSERY, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—The greatest Wonder of Modern Times.—They correct bile, prevent flatulency, cleanse the liver, purify the system, renovate the debilitated, strengthen the stomach, increase the appetite, invigorate the nerves, promote health, and reanimate the weak to an ardour of feeling never before expected. The sale of these Pills throughout the globe astonishes everybody, convincing the most sceptical that there is no medicine equal to Holloway's Pills for removing the complaints which are incidental to the human race. They are, indeed, a blessing to the afflicted, and a boon to those who suffer from disorder, internal or external. Thousands of persons have testified that by their use alone they have been restored to health after other remedies had proved unsuccessful.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. John Muller, to SELL BY AUCTION, on the Premises, The Brimsdown Nursery, Green Street, Enfield Highway, N., on THURSDAY NEXT, September 15, at 11 o'Clock punctually, there being upwards of 1300 lots to sell in one day, about

60,000 STOVE and GREENHOUSE PLANTS, remarkably well-grown, and in first-rate condition, including,
 20,000 WINTER-FLOWERING HEATHS,

including Hymenalis, gracilis, Cavendishii, perspicua, erecta, hybrida, &c.

3000 TREE and other CARNATIONS,
 including Mrs. Moore, Duke of Fife, Duke of Clarence, Germania, &c., &c.

600 CARNATIONS, Winter Cheer, best new scarlet,
 1000 TEA ROSES, in pots,

consisting of The Bride, Niphetos, C. Mermet, Maréchal Niel, Climbing Niphetos, Gloire de Dijon, &c.

5000 Solanums, exceptionally well coloured,
 500 Crotons, beautifully coloured

5000 Ferns—Adiantum, Polypodiums, Pteris, Lomaria, &c., and leading varieties

3000 Bouvardias, leading sorts
 1000 Ampelopsis Veitchii
 5000 Genista fragrans

Clematis Jackmanii, Ivies, large quantities of Ficus, Aspidistras, Anthuriums, Grevilleas, Poinsettias, Plumbagos, Callas, Aralias, Abutilons, new Coleus, new hybrid Crassulas, &c.; also Stove Climbers, including Dipladenias in variety, Chlorodendrons, Bougainvilleas, Tacsonias, &c.

May be Viewed any day prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheap-side, London, E.C.

N.B.—The whole of the Stock is in first-rate condition. The Ericas and Solanums are unquestionably the finest lot offered at this Nursery for many years; the Ericas being specially well set for flower, and the Solanums well berried.

Tuesday Next.
MESSRS. PROTHEROE AND MORRIS beg to announce that they will include in their ORCHID SALE, on TUESDAY NEXT, Sept. 13, a splendid consignment of TREE FERNS, including 14 grand trunks of Dicksonia antarctica, probably one of the finest lots ever sent over, ranging from 7 to 12 feet in length. Also CYATHEA DEALBATA, MEDITARIS, and CUNNINGHAMII; DICKSONIA SQUARROSA; 13 cases, containing 40,000 Seeds of MACROZAMIA SPIRALIS; a quantity of other Ferns in clumps and bundles, the whole received direct from unreserved Sale. On view morning of Sale, and Catalogues had.

Tuesday Next.
MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and 213, Park Road, Clapham, S.W., to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheap-side, London, E.C., on TUESDAY NEXT, September 13, at half-past 12 o'Clock, an unusually healthy and fine consignment of CAITLEYA GIGAS IMPERIALIS, just to hand, ex Paris, every plant is well-leaved, and we can say they are best condition plants offered. Through a misunderstanding the plants were mixed by the persons of our collector with *Caitleya aurea*; purchasers will therefore have a chance of picking their own fancy. Also a few special selected plants of our superb strain of CAITLEYA AUREA; for richness in colour they outstrip anything seen. The plants were collected from the same locality as those we had the two previous years, and which turned out such really marvellous varieties, amongst them *Caitleya Masiana*; a small plant recently sold at Ho Vick House, realised 95 guineas. We can recommend the above plants with every confidence as a good investment; also a small consignment of ODONTOGLOSSUM ROEZZI, and a few plants of the rare and beautiful EPIDENDRUM WALLISI; also 100 lots of CAITLEYA TRIANÆ, imported plants; 100 lots ESTABLISHED ORCHIDS (another property).
 On view morning of Sale, and Catalogues had.

Tuesday Next.

TUBEROUS BEGONIAS.

LAINGS' Single & Double Collection is the best.

This has again been proved by the award of

A **GOLD MEDAL**, at the *Earl's Court International Horticultural Show*,
August 27 and 28, 1892,

For the Largest and Finest Group of Begonias ever seen, over 1000 plants being used.

Extracts from the Press:—

This was one of the finest groups of Begonias ever arranged.
—*Journal of Horticulture*.

One of the most conspicuous features of the Exhibition was
the immense group of Begonias from Messrs Laing. The
plants, individually of fine growth, and represented the best
and most recent varieties of the firm. A Gold Medal awarded.
—*Gardeners' Magazine*.

The Gold Medal Bank of Begonias shown by John Laing &
Sons is a triumph of grouping as well as growing.—*Daily News*.

The finest group we have seen this season.—*Gardeners'
Chronicle*.

Messrs. Laing & Sons surpassed themselves in their mag-
nificent display of Begonias, which occupied a large space,
being most effectively arranged.—*The Garden*.

We cordially invite all Lovers of Flowers to inspect our "Truly Magnificent Show of Begonias."

CHELSEA, LONDON, S.W.

Baumanns to select a bloom on the show day, over him who has to look carefully over a dozen or so of plants before he can find one up to the mark; but then, on the other hand, he has perhaps bestowed far more care and attention on these few than the former did on his large number, and is very often in a position to beat him. During a long acquaintance with Roses and rosarians, I have known several cases where an amateur, who has been very successful as a small grower, has been carried away by his enthusiasm, and gone into thousands instead of hundreds, but I have never seen an instance in which he has done so to the improvement of his flowers; but while admitting all this, it is not a pleasant thing to see a large Triton buffeting the poor little minnows about.

There was another objection that many of us entertained to this change, viz., that it was likely to introduce a system of espionage and want of brotherly feeling among competitors, that people might know perfectly well that an exhibitor had more than 1000 Roses, although

who did join, we have but little means of judging how far they were influenced by the consideration of the change that had taken place. I obtained several of these, but I do not think it entered into any of their minds that they were supporting a new order of things; they did not join as exhibitors but as lovers of the Rose. But the result is still more disappointing when we come to the number of exhibits; we were taught to expect a vast increase here, small growers were to think as the competition was to be so keen, that the judges would be obliged to go beyond the schedule, and award a number of extra prizes; but in the table annexed, which has been carefully compiled from the entry-book of the Crystal Palace, it will be seen that there was in reality a considerable falling off, for that while the exhibits in the present year under the revised schedule, amounted to 134, in the last year they made 180, so that in reality there is a considerable falling off, and this although an entirely new class was added for growers cultivating less than 500 plants:—

There were no angry expostulations or querulous complaints, and it would have been difficult to ascertain on which side members had taken it. It is this spirit of good feeling and kindly consideration which has so helped forward the National, and so long as it continues we have no fear for the continued prosperity of our Society. *Wild Rose.*

NEW OR NOTEWORTHY PLANTS.

KALANCHOE MARMORATA, *Baker, n. sp.**

This new species of Kalanchoe was brought alive lately, with many other interesting plants, from the mountains of Abyssinia, by Professor Penzig of Genoa. When I visited, last November, the garden of Mr. Thomas Hanbury at La Mortola, it attracted my attention by its glaucous leaves, copiously spotted with brown; and now M. Cronmeyer has sent me a specimen in flower. I find that it is a typical Kalanchoe, nearly allied to *K. Schimperiana*, A. Rich.; but in that species the whole plant is covered with fine pubescence, and the flowers are much more numerous, and bright yellow. The nearly-allied *K. grandiflora*, A. Rich., has purple flowers. The name *grandiflora* is preoccupied by an Indian species, which was described by Wight and Arnott, and is figured in *Bot. Mag.*, t. 5460. The Abyssinian plant will therefore require another name, and I would suggest *K. macrautha*. I am not aware that any other Kalanchoe has the leaves similarly mottled. A very large number of new species has been found lately by Mr. Baron, and others, in the sterile elevated tracts of Madagascar. The difficulty with all these *Crassulaceæ* is, that one gets such a very poor idea of what the plant is really like from dried specimens.

Perennial. Leafy stem elongated, terete, glabrous, glaucous, $\frac{3}{4}$ inch in diameter low down. Leaves decussate, sessile, obovate-cuneate, erecto-patent, 3 to 4 inches long, half as broad, pale glaucous green, with copious blotches of brown, crenate, except at the cuneate base. Cymes few-flowered. Calyx $\frac{3}{4}$ to $\frac{1}{2}$ inch long, cut down to the base into four lanceolate segments. Corolla-tube above 2 inches long, angled, cylindrical, dilated at the base, greenish-white; limb white, 2 inches in diameter; lobes spreading, ovate-acuminate. Stamens 8, biseriata, the longest 4 just protruded from the throat of the corolla; filaments filiform; anthers small, oblong, yellow. Styles 2 inches long, much overtopping the anthers. The corolla, in size and shape, resembles that of *Nicotiana persica*, *Bot. Reg.*, t. 1592, but, of course, has only four segments instead of five. *J. G. Baker.*

HABENARIA CARNEA, *N. E. Br., n. sp.*

Although a figure of this plant appeared in the *Gardeners' Chronicle* last year (see vol. x., p. 729, fig. 105), my description of it was not then published, having in some way got lost in the post, together with those of some *Stapelia*s.

Habenaria carnea is a native of Penang, where it was discovered and introduced into cultivation by Mr. C. Curtis, who sent the plant to Kew, where it flowered in the autumn of last year. It is a very distinct species, differing from all the other East Indian members of the genus except *H. militaris* in the form of the lip. The leaves are all in a radical rosette, and are $1\frac{1}{2}$ to 2 inches long, by $\frac{3}{4}$ inch broad, lanceolate acute, dull green, covered with small whitish spots. Flower-stem, 5 to 6 inches high, pale brownish-pink, with about three ovate acuminate sheaths, not very closely wrapped round the stem. Flowers few (four in the specimen seen), in a lax raceme, of an uniform pale pink, fading to pinkish-white. Ovary 1 inch long, acutely ribbed, pale olive, exceeding the acuminate bracts. Dorsal sepal 4 lines long, 2 lines broad; lateral sepals $\frac{1}{2}$ inch

* *Kalanchoe marmorata*, *Baker, n. sp.*—Caule crasso glabro elongato; foliis sessilibus obovato-cuneatis crenatis glaucis maculis copiosis fuscis marmoratis; cymis paucifloris, calycis segmentis lanceolatis, corollæ albæ magnæ tubo elongato angulato, labiis ovatis acuminatis; staminibus biseriatis, antheris parvis oblongis.

RESTRICTED CLASSES, CRYSTAL PALACE, 1892, COMPARED WITH SIMILAR CLASSES OF 1891.

he had entered in that class; but who was to "bell the cat" was the question, and that therefore, probably, it would as now be left so far as that was concerned, to the honour of each exhibitor. Well, so of course it has been, exhibitors have entered in the various classes assigned to them, and as no complaints have been lodged on that score, we must only conclude that they "were all honourable men."

Well, the change has been made, and we have now to see how it has worked. Two things were stated by the advocates of the change, that it would largely increase the number of exhibitors, and also add considerably to the members of the National. I hardly think the result has corresponded with their anticipations. It is true, as will be seen, that the entries of new members has increased considerably, but there were only thirteen more joined the Society than in 1889, which in a total of nearly 500 members is, I fear, a case of "great cry and little wool;" and out of those

With regard to the new members, the following are the numbers who joined:—In 1888, thirty-five; in 1889, forty-eight; in 1890, thirty-nine; in 1891, thirty-four; and in 1892, sixty-one. This does not represent the actual addition of these members to our list, but that these have joined, while, as in all societies, the number of old members has been diminished by death or other causes. There will be some who will say, perhaps, that even "this is only the effect of a spurt," and that it will not be kept up; while others will say that the excellence of the new arrangement has not been proved sufficiently, and that its popularity will bear fruit later on. Time alone can decide these questions; in the meantime, I think we may say the new departure has neither justified the hopes of its adherents, nor the fears of its opponents.

There is one subject of congratulation connected with the whole subject—the loyal manner in which it has been carried out by all, whether adherents or opponents of the new departure.

long, 5 lines broad, obliquely elliptic-ovate, the upper edge nearly straight, the lower very curved, and the base adnate to the mouth of the spur. Petals, 4 lines long, 3 lines broad, obliquely ovate, and together with the dorsal sepal forming a small hood over the column. Lip large in proportion to the rest of the flower, 1 inch long, and the same in breadth, somewhat square in general outline, with rounded angles, three-lobed, the middle lobe broadly transverse, obtusely bifid, the side lobes broad, obliquely ovate obtuse, in the same plane with the front lobe, and projecting forward so as to overlap it a little. Spur, 2½ inches long, slender. Column with an oblong, tooth-like process standing erect between the arms of the rostellum, which projects

a pale ground. The flowers are solitary, on pubescent brown scapes, the dorsal sepal proportionately large, white, with radiating green nerves, and a stain of vinous red across the centre; the inferior sepal is much smaller, and of the same colour; the petals are narrow, white, tinted with vinous-red at the apices, and closely veined with green; ciliate and warted on the margins, with an occasional spot on the surface, and some brown specks near the base; the lip is of a rich glossy-brown colour, slightly concave below the opening, and speckled on the unfolded lobes; the staminode is of a pale green colour, with darker green reticulations. C. Warneri × superbiens.

Cypripedium × *Daisyae*.—The foliage is strap-shaped in character, 8 inches long by 1½ inch broad,

which numbers about 250 species and varieties, and embraces many of the rarest and largest specimens in the States. Among them may be mentioned:—
Cypripedium Stonei pallens, ten spikes, with white dorsal, pale petals and pouch.
Cypripedium Schroderie splendens, nine fine spikes.
Cypripedium Domini rubescens, ninety growths in full bloom.
Cypripedium grande atratum, with eleven strong spikes; its large flowers, with long drooping tail-like petals, making it very effective.
Cypripedium Chamberlainianum, with its hairy flower buds, twisted petals, and rosy lip; no doubt the first to bloom in America.
Cypripedium superbiens, large pan, in full bloom.
Cypripedium praestans, the finest of the Philippinense group, with its bright yellow, brown striped sepals, long twisted petals, and pale pink lip, with many others might be mentioned among the best in flower at present. Robert M. Grey, gardener to H. Graves, Esq., Orange, N.J.

A NEW ATHYRIUM.

I SEND you herewith photographs showing a frond and the whole plant of a quite new form of *Athyrium filix-femina*, which I found last year at Strathblane in Scotland. This variety, named A. f. f. *revolvens* (Drury), is especially interesting, as being the first find of a quite new type in this species, characterised by an excessive convexity in all its parts, which results in the fronds forming graceful curves, terminating with a marked spiral twist, due to the adjustment of the rolled-in upper surface to catch the lights. The pinnae partake of the same character in a still more marked degree, forming in the mature fronds a symmetrical row of ringlets; and finally, the tertiary divisions or pinnules are distinctly curved and rounded. On close examination it is seen that the general structure is that of a purely normal *Athyrium*, the abnormal character, striking as it is, being simply due to the continued growth of the superficial cells, which, by their expansion, lead to the rolling inwards of all edges and terminals. I found a fine plant of five crowns in a little glen just behind Mr. J. C. Murray's house near Strathblane, and some dozen yards lower down he immediately found another, in which, however, the pinnae are only curled longitudinally, the pinnules being flat. The one was probably a seedling of the other; but in all the seedlings raised from my own find, the per-revolute character is very marked, not one showing the least tendency to reversion. The find is particularly interesting to the hybridiser, or rather crosser—if I may coin an ugly but more appropriate name, as the pendulous character would undoubtedly form very pretty combinations with many of the plumose and crested forms. So far, the only approaches to the type in the species are several flexuose varieties, none of which, however, have the one essential merit of symmetry. A. f. f. *revolvens* is a robust-growing plant, of full normal size and habit, and is, I venture to think, a decided acquisition to our native decorative Ferns. Chas. T. Drury, F.L.S., Fernholme, Forest Gate.

SCOTLAND.

USE OF GOLDEN PRIVET, AND OTHER PLANTS.

WHILE making a call recently at Beech-hill Nurseries, near Edinburgh, to see Mr. Downie's fine selection of Begonias (the best of which, however, were removed to a house by themselves, for supplying seed), my attention was arrested by some clumps of plants deep golden in colour, and such as can be seen at considerable distance. I discovered that they were Golden Privet, more brilliant in colour than the numerous Pansies, golden balm Pyrethrums, and other yellow plants in close proximity to them. When such fine effects for permanent decoration of

FIG. 51.—A NEW VARIETY OF THE LADY FERN.

forwards. Stigmas parallel, placed under the arms of the rostellum at the mouth of the spur, light green.

This is one of the most beautiful species of *Ilabenaria* I have seen, the delicate soft pink colour of the flowers when first they expand is very charming, although after a few days, the pink becomes much faded. It is rather remarkable that in so vast an order as the Orchidæ there are very few flowers in which pure pink predominates, usually it is more or less mixed with a tinge of blue; and of those that have the flowers entirely pink, besides the present plant, I only know of some in the genus *Satyrion*, which is also a terrestrial genus. Pure pink appears to be one of the rarest colours among Orchids. N. E. Brown.

NEW HYDAID CYPRIPEDIUMS.

Cypripedium × *Warnero-superbiens*.—The plant is intermediate between its parents, foliage 5 inches long, acute, broad near base, reticulated with dark green on

faintly tessellated, and bright green in colour. The flowers come one to three on a pubescent brown scape, 18 or more inches long; the sepals are white, shaded through the centre with pale green; the whole is tinted and veined with carmine, and speckled with brown at the base, the dorsal somewhat the larger and deepest in colour; petals 2½ inches long, ¾ inch broad near apices, tapering towards base. The basal half is primrose yellow, warted with purple, and the apical half of a bright carmine, and slightly dilate; lip (much the shape of C. Lowii) brown, shaded with vinous red, paler underneath, veined with green, infolded lobes speckled with crimson, staminode obcordate, pale green and carmine. The result of a cross between C. Lowii ♀ and C. caucanthum superbiens ♂, and is named in honour of Miss Daisy Graves, of Orange, N.J., an ardent admirer of the genus.

The above are now in flower in the extensive collection of Henry Graves, Esq., of Orange, N.J.,

conspicuous portions of ground in many of the leading nurseries is produced by beautiful shrubs, one feels that it is regrettable that there is so little done in this way in the fine grounds of so many private gardens, especially when one is accustomed to see much labour expended in keeping beds of tender and half-hardy plants in order, with the result, that before they are quite at their best, frost sets in and destroys them.

Where beds of shrubs of the choicest species are arranged for effect in groups—and this may be seen in some places most artistically done—beauty and a dressy appearance are easily maintained all the year round. I have never known interest to flag where such beds are established. In many northern gardens this season there will not have been two months of real beauty in them; plants were placed in the beds for some weeks before they made any growth at all, and in many places the ordinary bedding plants did not come to their best this season at all. Antirrhinums (even the most valued dwarf white), Pentstemons, Pansies, Carnations, and others of the hardy class, are scarcely (August 1) beginning to open. Dahlias (we only grow Cactus and Pompons for cutting, which are forced, to flower early), Begonias, Hollyhocks, Salvias, Fuchsias, Petunias, and some other species are also unusually backward. Reverting to shrubs for decoration of parterres and ornamental gardens (not the single plants formally placed as sentinels), beds of Berberis, Mahonia, St. John's Wort, Portugal Laurels, or similar shrubs kept dwarf with the knife (not clipped), and shrubs or dwarf trees planted skilfully among them at proper distances, to show the individuality of each. It is not necessary to keep them of uniform height, but if allowed to get overgrown the object will be defeated. Golden Privet is one of the most beautiful shrubs for bedding, as it can be kept quite low; but I find that in low damp positions it is liable to be injured by frost. Mr. Downie's plants are placed on high and sunny positions.

GLASGOW AMATEUR GARDENERS.

There is something remarkably practical in all the schemes of the western capital of Scotland for advancing the interests of the citizens of St. Kentigern; and much success has attended the efforts of certain lovers of their race who have, for the last eighteen years, been giving tangible assistance in promoting horticulture among their less-influential neighbours at Saracen Gardens. The exhibition lately held in the allotment grounds, indicates an amount of horticultural intelligence not often met with among amateurs. In addition to an annual show held in a tent, the society throws open their grounds to the public, who appreciatively take advantage of viewing the skilful labours of their townsmen, who find this a school of sound practical tuition. The gardens are divided into squares, where the cultivators sub-divide them economically into smaller spaces, in which the produce is raised separately. Each cultivator takes charge of his own space, which is enclosed by a neat wooden fence and a gate, which can be locked harmless emulation, as a matter of course, is excited among the cultivators, who raise produce of much excellence. There need be no "begging borrowing, or stealing," to furnish the exhibits in the spacious tent. The produce can be seen growing in these amateur gardens, and no doubt each is watched with keen eyes by the competitors, who are to join in the conflict on the exhibition day.

Florists' flowers are grown extensively, especially such as Stocks, Asters, Marigolds, Pansies, Roses, Dahlias, Pinks, Pentstemons, Antirrhinums, Lilioms of species, and collections of herbaceous plants. There are, among vegetables, very fine beds of Leeks, Parsley, Onions, Beet, Carrots, Cabbage, &c., all in squares not extending over 40 feet. Those for competition are ticketed, in order to let the censors compare them with their fellows, the produce being of such equal merit, that it is with difficulty a verdict can be given to the best. Then there are small structures dotted about everywhere, of various forms and dimensions. In many of them may be

seen well-grown flowering and foliaged plants. The methods adopted to raise the large Leeks, Celery, Carrots, Beet, &c., cannot be concealed—glass tubes—and in ridges the finely-blanching Leeks may be seen; and Celery, grown in similar contrivances, show originality, and, in some cases, real ingenuity. The means used for protection of the flowers to be cut for exhibition in the tent are also ingenious and varied; but what seemed to be most efficient for the purpose was a glass light, placed on four posts, fixed in the ground, which throws off rain, but which does not exclude light and air. One could say a deal on these gardens of the industrial classes, which are so instructive to the amateur cultivators who visit them. In the exhibition tent, many creditable exhibits were placed, and competition was close and keen. Among flowering plants were Fuchsias, variegated and zonal Pelargoniums, Lilioms of species, Balsams, Cockscombs, Petunias, Ferns, and foliaged plants, creditably represented. Cut flowers were said to be less in number than usual, but most of them were of fair quality. After the judges had finished their task, a military band performed, and the public were admitted, at a small cost, to see the large breadths of flowers and vegetables, no doubt receiving useful hints from these cultivators, who have spent much of their time and talents there for eighteen years past. The promoters of this praiseworthy scheme must be highly gratified to witness such tangible good accruing from their efforts to humanize (as this town gardening does in a large degree) their less prosperous fellows. The hospitality to the judges, whom they invite from long distances off, is almost overwhelming. The brotherly spirit which appears to exist among these Glasgow "chappies" is very marked and gratifying. We hope, ere long, to have other remarks on the qualification of some Glasgow professional cultivators. *M. Temple.*

PHLOXES.

DURING the Begonia and Plum Conference at Chiswick, the beds of Phloxes on either side of the centre walk attracted considerable attention, and drew forth great admiration. Very many gardeners and others interested in floriculture might have been seen noting down the various varieties which had received marks from the Floral Committee of the Royal Horticultural Society; all of these had labels attached in such a manner as to render note-taking an easy matter. The Phloxes at Chiswick have been received for trial from various growers, notably Mr. J. Forbes, of Hawick; Messrs. Dicksons, Chester; Paul & Son, of Cheshunt; and Lemoine, of Nancy. Those who know the old species from which the present handsome varieties have been obtained, will readily recognise the patience and work which have been employed to produce the dwarf, compact-growing plants that give us such fine panicles of good-shaped and brilliantly-coloured flowers. One thing in favour of Phlox raising is the fact that they can be sown and flowered in a year, and cuttings taken in the autumn from the bottom growths make good plants under ordinary care, ready for planting in the spring. Many of the varieties seen at Chiswick would be admirably adapted for pot-culture and conservatory decoration.

The early-flowering Phloxes of the suffruticosa section have been raised from the species of that name; they are, however, less showy, and of poorer habit than the later ones. Miss Mima, a white-flowered variety, with pale pink eye; Miss Cook, bluish, with lilac eye; and Rosy Gem, a pretty rosy-lilac flower, are three good varieties of this section.

The later-flowering varieties, known as the decussata section, have been obtained by crossing and re-crossing several species and varieties, all of North American origin, as *P. maculata* (decussata), *P. pyramidalis*, *P. paniculata*, and *P. maculata* var. *suaveolens*, until the original species have become all but lost, and in their place we have a fine race of autumn flowers, blooming from July through August into September, and later, if the weather continues open.

The following selected varieties have all re-

ceived the notice of the Floral Committee; they are distinct, and a list of their names may help those who cannot get to Chiswick:—Flambeau, medium height, producing large heads of fiery-red flowers with dark centres; Molière, dwarf, large rosy-pink flowers; Bournouf, medium height, dark scarlet flowers, with dull purple eye; Aspasie, flowers shaded lilac, with white centre; Henri Murger, dwarf, flowers as large as a five-shilling piece, white, with large crimson centre; Iris, a tall variety, with immense heads of violet-purple flowers; Granville, medium height, ivory-white; Eugène Dangaverillus, medium height, free, pale lilac, white centre; La Fille de l'Air, a very dwarf plant, flowers white, with rosy lilac eye; Panorama, dwarf, lilac, with white centre; Boule de Fen, salmon-red, pale eye; Pluton, medium height, fine reddish-purple flowers; Avalanche, a very dwarf plant, with large panicles of the purest white flowers; La Soleil, dwarf, large rosy-pink flowers, bluish centre; Eclairer, dwarf, purplish-rose with pale centre; Wm. Robinson, salmon-pink with rose eye, tall; Belvedere, dark carmine-rose, dark eye; Long-champs, bluish, with a rosy centre, tall; Panama, large white; L'Africaine, a dwarf free-flowering variety, with pale lilac flowers, curiously spotted and blotched with deep rose; Ornament, tall, violet with shaded centre—a telling variety; Epopee, dwarf, large flowers, rosy-lilac, pale centre, very pretty; Mrs. Laing, tall, bright rosy-pink, with large crimson eye; Alexander Matheson, tall, pale rose, dark eye.

The above varieties give a wide range of colour, sufficient for a general collection; but many other varieties and shades of colour may be noted at Chiswick. Several of the brighter-coloured Phloxes at Chiswick have had their flowers slightly scorched, which seems to indicate that their cultural requirements are a cool moist soil, and some amount of shade from buildings, trees, &c. *Lodoicea.*

THE GIANT BAMBOO.

IN our present issue we give two illustrations of a gigantic Bamboo growing in the Ceylon Botanic Gardens. These giant Bamboos naturally attracted the attention of Mr. J. H. Veitch, whose letters are appearing in our columns (see *Gardeners' Chronicle*, March 12, 1892, p. 333), and to whom we are indebted for the photograph, a reproduction from which is now given. The young shoots present a remarkable appearance, like Brobdignagian Asparagus, while the mature plant (fig. 52, p. 303) forms a tuft as remarkable for beauty as for size. It was described in our columns for August 27, 1881, by Dr. Trimen, who speaks of the alarming grinding, creaking, and clattering noises which go on in windy weather from the straining and breaking of the canes. The species is, we believe, that known as *Dendrocalamus giganteus* of Munro. The mass measures about 98 feet in circumference at 3 feet from the ground, each culm being from 26 to 29 inches in circumference, and 100 feet in height.

SHIRLEY AND OTHER POPPIES.

FOR several years past the gardening community has made much improvement in the arrangement of flowering plants in the garden, and anyone visiting the London parks will doubtless have noticed how well the planting of the flower-beds is now carried out, in accordance with improvement in public taste in such matters. Much useful knowledge may be gleaned in this way during the usual visit made to the metropolis. Having had considerable experience in flower-gardening, I am convinced that no style is so good for a flower garden as one in which great variety is aimed at. This may be shown in the materials employed, whether these be Pelargoniums, tuberous Begonias, Roses, annuals and perennials, herbaceous plants, bulbs, &c. Violas are modern acquisitions which do well on some soils and not on others. In light soils they are past perfection before the summer is over, but where the plants succeed no combina-

FIG. 52.—GIANT BAMBOO IN THE BOTANIC GARDEN, CEYLON. (SEE P. 302.)

tion with other plants is better than with Tea Roses, examples of which we have here two beds which have been in perfection since last June.

I do not intend to advise what varieties of Pelargoniums and the like should be grown, but I wish to draw attention to annuals, hardy perennials, and herbaceous plants generally. I do not think I can do better than to describe this style of gardening, as practised in these gardens. Chief amongst the annuals which grace our garden in the early summer, or rather, late spring months, are Shirley Poppies. This Poppy grows rapidly in favour with gardeners, on account, no doubt, of its great variety of colours, which range through many shades from brilliant crimson to delicate rose. It would be difficult to find an annual plant that gives more variety from one packet of seed; and the fact that it will grow in the open air from first to last, enhances its value. In choosing positions for this Poppy, it is essential that they should be such as will enable the flowers to be seen from a distance, and where the plants may fully develop, positions under overhanging branches of trees being avoided, and any attempt at formal arrangement avoided. They appear to the best advantage in a mixed herbaceous border, or when intermixed with other annuals in beds. If very early-flowering plants of Poppies are required, seeds should be sown in September, where they are to flower.

I usually make one sowing at this time in various parts of the flower garden, and a bed of them is sown in the kitchen garden, which furnishes cut flowers for house decoration. This sowing should be made in dry positions.

When the spring comes the plant grows rapidly, and is soon in full beauty. Another advantage in making the September sowing in a dry position, is better security against frost, as from long experience I find that losses will occur if the position is low-lying and damp. No attempt should be made to transplant annual Poppies, as they seldom do well, unless transplanted quite early in the spring, and even then the plants do not start away with the freedom of untransplanted ones. The Victoria Cross Poppy is a magnificent variety, and should be in every garden. Its colour is rich vermilion, with a distinct white cross, and is a variety that we use as extensively as the Shirley Poppy; and the plant not lasting so long in perfection as the Shirley, I make two sowings, one in March and another in May, and by so doing the garden is bright with its presence until well on in August. The most useful annual Poppies at present in flower here is a variety that I only know by its colour, viz., black and red. This was sown in May with the Victoria Cross, and judging by its slower growth, I sowed a patch of each variety along side in different places, so that when the Victoria Cross had finished flowering, the black and red filled the gap caused by the removal of the former.

The experienced gardener will easily see that relying on Poppies to fill the flower-beds would cause disappointment, as there would be many gaps in the display; but I hope in a future note to deal with this point, and show how the beds and borders may be kept gay till the frost comes, and obliges us to prepare for winter. *A. L. Ashford, Kent.*

THE GRANGE, HACKBRIDGE.

Few gardens have such distinct and interesting features about them as that of A. H. Smea, Esq., and few owners of gardens obtain greater delights from their treasures than does this gentleman. While pursuing general gardening on well-known and proved lines, both Mr. Smea and his clever gardener, Mr. Cummins, are continually watching their pets, and experimenting on some of the more difficult; these being always intelligently carried out by the light of experience gained from observance of the plants themselves. Of late years the summering of cool and intermediate Orchids in the open air has been the favourite study, and the annually extended experiments, and increased number of good

results, prove that for those who carefully pursue such a method of culture many welcome advantages are to be obtained, such as keeping the plants perfectly clean, ensuring later, and in many cases, more profuse flowering, and above all avoiding that gradual degeneration which those who keep their plants always in glass structures (and especially in the same house always), so frequently complain of.

The pretty garden surrounding the commodious dwelling betrays but few indications of modern gardening, and yet everything is neat and orderly. The house itself is partly clad with Roses, Honeysuckles, Clematis, &c., and in its immediate vicinity are some bright beds of mixed flowers, edged in some cases, with Pelargoniums, a walk running round the whole; this walk on the garden side is bordered by a semi-wild garden of the most beautiful and picturesque character, the arrangement being made the easier by the fact that a narrow rivulet runs through this portion of the garden, with here and there a rustic bridge thrown over it. Here we find the tall Bamboo-like Rushes, the Water Carex, Lythrums, Foxgloves, Epilobiums, Ferns, Lysimachias, and other British plants, mingled with the tall and showy naturalised Indian Balsam, the American Solidago, the tall Campanulas and Roses, scented Stocks, Mignonette, &c., grouped in admirable irregularity beneath the overhanging old Hawthorns, and other flowering trees.

Following the rivulet through the shady and winding walks to the Fern Valley, made memorable by the loving manner in which the father of the present proprietor described it in his interesting and valuable work *My Garden*, we come to the open-air experiments with Masdevallias, and find arranged on a trellis above the rivulet, a fine collection of the showy species all in perfect vigour, with the roots peeping over the sides of the pots of many of them—some are in flower, and more in bud. These are in a shady spot, and beside them is a grand plant of *Todea superba*, which has thriven for years with barely a glass protection. Farther on are more Orchids similarly placed to the Masdevallias, but in a rather more airy situation; among these the large-bulbed plants of *Oncidium macranthum*—which are sending up very strong spikes—are remarkable, and indeed, the whole of the open-air experiments on Orchids here are evidently satisfactory. With the light-loving *Lælia anceps* varieties, *L. autumnalis*, *L. majalis*, *L. albida*, &c., another plan is adopted, and that is to suspend them in an unheated, unshaded, glass-roofed, temporary structure, in summer, and by such treatment it is claimed that though the plants make smaller bulbs than those grown in the ordinary Orchid-houses, yet so far as the flowers are concerned, they are better, for even the smallest bulbs produce spikes. Certainly they are in a very sound and prospectively floriferous condition at present.

Passing down through the fine kitchen garden, in which are a wonderful collection of Apples and Pears (the Apples here are good this year, Pears scarce), and whose borders are brilliant with gay flowers, we come to the picturesque walk alongside the river Wandle, which bounds The Grange Gardens, and among beautiful and interesting flowers we come to

THE ORCHIDS,

which form the principal objects of culture at these gardens; and especially the Cattleyas, the collection of varieties of *Cattleya Mossii* being superb. The plants are in grand health on their staging well up to the glass, their roots running over the pots in a luxuriant manner. This is even more marked in the case of the *Lælia purpurata* varieties, which have roots 3 or 4 feet in length, and reaching to the water in the tank. In flower are a few fine specimens of *Cattleya Gaskelliana*, remarkably handsome varieties; *Lælia elegans*, *Cattleya Dowiana*, and a grand hybrid of *C. aurea*, which is nearest to *C. Hardyana Laverinsensis*, but Mr. Smea's is brighter and lighter in colour than the figured original. The golden veining of the throat of this form and its exquisite fragrance render it a covetable plant. *Catasetum Bungeothii*, too, is here in flower; a fine plant of *Dendrobium*

Dearei; *Angræcum falcatum*, which has had over forty spikes, and is still in bloom; *Dendrobium Phalaenopsis Schroderianum*, and other species.

The *Odontoglossums* are in fine health, and so also are the *Masdevallias* in the little lean-to at their back, and in both houses some are in bloom. One of the prettiest houses in the gardens is what is called the fernery, which has rockery on one side, above which Orchids, principally in flower, are suspended; and on the opposite side Orchids are arranged with Maidenhair and other Ferns, the roof above them being furnished with flowering climbing plants not liable to harbour insects. Specially noticeable were several species of *Acineta* coming into bloom, two or three interesting *Gongoras*, *Epidendrum erectum*, and other *Epidendrum*s, *Dendrobium formosum giganteum*, *D. Jamesianum*, *D. longicornu*, *Stanhopeas*, &c. By the enumeration of these, it will be seen, that plants of botanical interest are nurtured at The Grange, and in the other houses appear many curious *Bulbophyllum*s, *Cirrhopetalum*s, *Pleurothallis*, *Polystachyas*, *Restrepias*, &c., which by their quaint flowers give ample excuse for the space they occupy. In the other Orchid-houses are a fine lot of *Cypripedium*s in flower, *C. Parishii*, a grand variety, with a five-flowered spike; the best form of *C. Morganii* ×; a very large form of *C. Godefroyæ*, *C. superbiens*, *C. concolor*, *C. Harrisianum* ×, and others; also *Warszewiczella Wendlandii*, *Trichopilia hymenantha*, a pretty *Aërides*, which flowered among *A. Lawrenceanum*; and in one of the houses *Arundina bambusifolia* grows and propagates freely, and *Cyrtopodium*s and *Ansellias* thrive and bloom remarkably well.

The conservatory is as neatly arranged as ever, the greenhouses brilliant with *Begonias* and other showy flowers, with a good sprinkling of the now-seldom-seen new Holland plants and Cacti; the orchard-house and vineries well-cropped, and everything indicating care and attention. *J. O'B.*

ORCHID NOTES AND GLEANINGS.

VANDA SANDERIANA.

THE fine show of this beautiful plant at the Drill Hall on Tuesday last, and the handsome specimens of it now to be met with in many collections, point to the fact that it is only now getting thoroughly established with us. A specimen of it at Sir Trevor Lawrence's, Burford Lodge, has produced six spikes altogether, bearing fifty-one flowers, a number which it has been thought expedient to reduce. In the same collection is a plant of the handsome *Aërides Lawrencei*, with about 175 flowers, and the batch of *Habenaria militaris*, which contributed the glowing little group exhibited at the Drill Hall, has upwards of 100 spikes in various stages. *J. O'B.*

FIGS AT CHISWICK.

THOSE interested in the culture of these fruits ought to take the opportunity of inspecting the wonderful collection under the charge of Mr. A. F. Barron at the Royal Horticultural Society's garden at Chiswick. There are something like fifty varieties represented, and there are few but what have been bearing fine fruits for some time past—not that they are over now by any means, for when receiving a few hints from Mr. Barron but a few days ago, there were plenty of ripe fruits, and a promise of a continuation up to at least November.

Where such a varied collection is required, pot culture is the most suitable to be followed, and the advantage that is to be secured from such an immense variety is the certainty of a prolonged season, many of the varieties being much later than their close companions. The house is a tolerably large span-roofed one, moderately heated, and the plants are afforded as much air as practicable, to ensure good flavour. The plants are of different sizes, varying from 2 feet up to about 8 feet. They are subjected

to rather severe pinching or stopping, because space is a great desideratum in this house. Obtained from cuttings they are prolific at a very early age, a plant that we noted bearing as many as forty fruits being but two years old. No hard forcing is done, but a little gentle heat only is used to stimulate them into growth, and this is maintained until the last fruits have been ripened. Turning to the question of varieties, we were somewhat interested to hear from Mr. Barron that the best quality Figs will not carry, what is generally called, a first crop. There is no doubt but that many of the newer and little known varieties are superior in quality to either Brunswick, Brown Turkey, or Negro Largo; but the disadvantage spoken of would, perhaps, prove a serious objection with some growers, as the first or early crop is often valued the most. Monaco Bianca is the best quality Fig we have tasted. The fruits are green, large, and exceedingly luscious, and will please, if it does not even astonish, any one tasting it for the first time. Bourjasotte Grise is another excellent variety; it is a good bearer, of magnificent quality, and the fruits may be relished, even if not quite ripe, which can scarcely be said of other varieties. Mr. Barron says this is the very best Fig he has got, taking it all round.

The largest and finest of the whole collection is one called Nebian, a beautiful green fruit, of good quality. Black Douro is another of the gems; the fruits are purple. Another purple is Doura Nebra, with fruits somewhat different in shape to most others, in that both ends are ovate, and the stem is exceedingly short. A new variety of Messrs. Veitch's, called Violette Sepor, may also be commended; the fruits are green, but slightly tawny, and the quality excellent. A "Bois Jaspée" is about the same colour, and we have seen fruits very similar to this staged as white Ischia, but all the Ischias are very small, scarcely bigger than good-sized Gooseberries. D'Agar is the very latest of all varieties, and, kept in a cool house, Mr. Barron says it can be had up to Christmas. The fruit is pretty and distinct, being of an intense green colour, with prominent longitudinal white marks upon it. De la Madeline is a very early one, and may be easily distinguished by the leaves, which are more entire than those of any other; the fruits are yellow. There are several small black varieties, of which the best is Grosse Violette de Bordeaux, the fruits of which are very black and rather small; they will keep in condition longer than any other. Very like it is Recluser, which was found growing on an old wall in a village of that name in Kent. It is a little rounder, and perhaps smaller than the preceding one. Of course, there are so many good varieties to be seen at Chiswick, that we cannot attempt to give a list of those that are of average quality; but the foregoing may be taken as some of the very best and finest quality Figs obtainable.

NURSERY NOTES.

MESSRS. KELWAY AND SONS, LANGPORT.

So great is the variety and so large the quantity of the productions of this firm, that a visit to their establishment at Langport cannot fail to be of interest at any time of the year; but during the flowering season of one or more of the specialties which have rendered the name of Kelway familiar to all lovers of gardens, the place has special attractions. Such a time is the present, when what is perhaps, *par excellence*, the "leading feature" of the Langport Nurseries, the *Gladiolus*, is in the height of its beauty. About 25 acres are devoted to this popular flower, no fewer than 20 acres being planted with proved sorts, which term also implies approved sorts. The remaining 5 acres are seedlings and spawn, the latter being, of course, the young bulbs formed around the base of the old corn. These are sown in drills, and much resemble a field of Wheat in the earlier stages. It is impossible to

describe the gorgeous and dazzling effect produced by the enormous masses of full-bloomed *Gladioli*, varying in colour from white, cream, and yellow, to deep scarlet, crimson, carmine, and purplish hues. Space will not permit the mention of individual varieties.

The *Pæonies* (also a specialty of Messrs. Kelway), of which about 10 acres are grown, have, of course, finished flowering, and are now maturing seed; they must have made a fine show when in bloom. *Delphiniums*, too, receive a large share of attention, about 100,000 plants of which formed a striking feature but a short time since, with their splendid masses of colour, varying from the deepest of blues and purples to the more uncommon, but not less effective, whites and yellows. A fine show of *Gaillardias* is now at its prime; many of the new varieties to be offered shortly are sure to meet with a large demand. Want of space precludes more than casual reference to the large stocks of quilled *Asters*, *Begonias*, *Pyrethrums* (100,000 plants), *Dahlias*, *Pentstemons*, *Hollyhocks*, and hardy herbageous stuff of every description.

One of the most striking features in the glass-houses is the stock of Cucumbers grown for seed; nearly 10,000 ripe fruit can now be seen. The most noteworthy varieties are Prince of Wales, a long smooth fruit, and of good shape; Conqueror, of immense size; Telegraph, Perfection, and Cardiff Castle—the two latter varieties are shorter, of good shape, and very prolific. These are, of course, all grown in separate houses, to ensure the seed coming true. A long house of *Cannas*, ranging in colour from brilliant scarlet to nearly white, was very striking, and a houseful of *Petunias* for seed deserves special mention.

In addition to the above, Messrs. Kelway grow about 100 acres of farm seeds of all kinds. The clean and healthy condition, and the high state of cultivation of a stock so large and so varied as that to be seen at Langport—to say nothing of the constant output of new varieties—show the organising skill of the Messrs. Kelway, and the zeal of their foreman, Mr. Drummond.

A TRAVELLER'S NOTES.

(Continued from p. 181.)

Lucknow, January 2, 1892.—A great change is noticeable in the vegetation round Lucknow to that which I have been accustomed to see for the last few weeks—the dry sandy jungle covered with little but low scrubby *Babool*, has given place to land, much of which is under cultivation—and the plants in the parks, gardens and streets, are like those in Bombay and Baroda. Mr. Ridley is in charge of Wingfield Park and the Horticultural Gardens at Lucknow. Wingfield Park, some 40 acres in extent, is a pretty, extremely well-kept park, but a few hundred yards from the road leading to the famous Residency, and one of the principal in the European quarter.

There are no gates, the entrances being marked by two white stone curbs. The roads are broad, 20 feet wide, hard, clean, and in perfect condition, and are covered with a peculiar red sand, which seems to bind well. Out of Colombo I have seen nothing like this red earth elsewhere—the effect is very pretty, the roads winding in and out through the grass.

The whole of the park is under grass, and round the largest pavilion extremely well kept. Small figures, on still smaller pedestals, are scattered about, especially on the centre lawn, round the large pavilion—and from time to time, whilst driving round the park, occasional glimpses of small white stone circular pavilions, usually on the summit of slight hillocks or knolls, are caught. These light graceful, small white stone structures, usually consisting of an arched dome, supported on light pillars, are very pretty—but I regard the statuary as being much too small—it seems quite lost.

On entering the park by the entrance nearest the town, one has on the right a road encircling the park, from which at right angles is another running parallel with the shrubbery, defying the park limits in this direction—other roads wind in and out between the grass plots. Large trees are dotted about, usually isolated, and no young planting seems to be

done—a few clumps are also to be seen. Amongst the large, isolated specimens I noticed, many *Eugénias*, some *Phoenix*, a few fine *Ficus religiosa* (the Peepul tree), and some especially good *Poinciana regia*, some of the specimens being quite 30 feet high. I think the long bipinnate foliage of this beautiful tree is handsomer here than I have noticed it anywhere previously; its long, big, twisted, thick brown seed-pods are not infrequently 2 feet long. *Nims* (*Azadirachta indica*) are also to be seen, as well as a few fine *Teak* (*Tectona grandis*), as handsome a feature here in the landscape as anywhere. Not unlike this in appearance is *Bignonia adenophylla*; the foliage is thick, the individual ovate leaf being large; the form of the head is regular and pyramidal. Several are scattered about the park, and an avenue of this tree leading to the horticultural gardens is very handsome. Another nice tree, distinctly worth special notice, is *Alstonia scholaris*, tall, evergreen, of regular habit, the head not spreading much; at the end of each shoot is a verticil of longish, thick, fleshy, ovate leaves; a nice specimen near one of the main roads is nearly 35 feet high. *Tamarinds* are also scattered about.

In the fork of the two roads, leaving each other at right angles and encircling the park, is a pretty, graceful clump of a not too strong-growing *Bamboo*, in front of some fine old *Tawarinds*. On either side of the road bearing to the right, are some single specimens, on the right of the road being a shrubbery and hedge hiding the public street outside; whilst on the left is the broad stretch of grass, several acres in extent, with single specimens dotted about. Following this road for a short distance, a rising knoll with a "suttee" (marking the spot where a woman has thrown herself into the fire consuming the body of her dead husband) soon comes into view. A clump of tall *Babools* crowns the summit. I was much struck with the entirely different aspect of the *Babool* from that it usually bears on the dry sandy desert. Here it is a tall, black-stemmed, not unhandsome tree, though its foliage is, of course, insignificant, whereas on the desert it is nothing but a low, scrubby, thorny bush for hundreds of miles. The favourable situation in Wingfield Park, where it doubtless does not suffer too severely from drought, makes a wonderful difference.

Crossing a small white stone bridge, spanning a former "nullah," not far beyond, Mr. Ridley's bungalow, standing a little back, and almost hidden from the road, is reached. It is approached from almost every direction by six or seven roads, all running into a broad circle round a piece of grass, with an insignificant piece of statuary, on a wide stone terrace in the centre. In the forks formed by the junction of these roads are clumps of trees, some very pretty—particularly two, one a fine *Ficus*, with some young *Phoenix sylvestris* beneath; and another a thick broad bush of *Bougainvillea glabra*, covered with blossom, more especially its young, sub-pendulous, long shoots, gracefully arching over on every side.

The bye-path to the bungalow, from this open space, where so many roads and paths meet, is but a few yards long, and has on one side a fine row of *Juniperus chinensis*, thick and healthy-looking, evidently at home, whilst the stems of three tall *Phoenix* soar up behind.

Looking beyond the bungalow, one's attention is immediately arrested by the broad spreading, flat head of a more than usually fine *Poinciana regia*.

Passing round the bungalow to again reach the main road, one passes close to one of the small white-stone, pretty little pavilions referred to on the top of a small knoll. On three sides are three tall *Casuarina muricata*, always graceful, with its fine needle-like foliage; below the knoll is a fine mass of *Bougainvillea* and some clumps of *Agave serrulata*, a handsome species, with semi-upright, short, stiff foliage, making offshoots freely.

A shrubbery partially hides the road from this pavilion. On again reaching the main road, on either side of which is a fine piece of *Bignonia adenophylla*, not far from a tall *Millingtonia hortensis*, shading a young *Cycas revoluta*, opposite a *Grevillea robusta*, some 25 feet high, the centre pavilion and that portion of the park most carefully looked after comes into view; a few small statues are dotted about near here, and a glimpse is caught of the light graceful pillars of one of the small pavilions in the far distance on the other side of the grounds.

The main pavilion is, as I have said, of white stone, oblong in shape, and is supported on a low stone terrace. Opposite its four straight sides are four long beds, 100 feet long by 25 feet wide; the designs in these beds, though simple, are tasteful, particularly

when one considers how limited must necessarily be the number of bedding plants at Mr. Ridley's disposal. The plants chiefly used are *Alternanthera* and *Pyrethrum* (Golden Feather), the first I have seen in India. The two beds facing the end of the building are the handsomest, one being laid out with broad diagonal lines of *Phlox Drummondii*, whilst at each end is a circular portion, the one nearest the pavilion having circles of Golden Feather and *Alternanthera*; the one at the other end having as centre-piece a small *Livingstonia*, encircled by *Anthericum*, the white variegated one, and a few other plants, amongst which I noticed *Chamaepeuce Casabonæ*. The bed at the opposite end of the building to this is laid out with small tiles in diamond-shaped patterns, with pretty white, black, and green stones between each. These stones are in straight lines, running between the small diamond-shaped beds containing the plants; the effect is very pretty.

At the end of one of these beds is the fernery, a flat-roofed structure, covered with the stems of "mouje-grass," tied to wire-netting. In the distance on the left a tall *Bougainvillea glabra* towers straight up over a dead tree for more than 30 feet, and on the same side is a tank with a *Cyperus alternifolius* shading a kneeling *Venus*, with a thick shrubbery behind, most noticeable in which is a fine *Arenga saccharifera*, with long stiff leaves; a *Caryota*, and a tall *Oreodoxa regia*.

On either side of the long bed is a path with the same red sandy earth. The entrance to the house is lined on either side by a row of *Biota orientalis*, none of the specimens being less than 10 feet high; behind which, on each side, are two tall Cabbage Palms, *Oreodoxa regia*, the tall straight stems slightly bulging at the base, rising clean and smooth for nearly 30 feet.

On one side of the house is a row of low *Crotons*, whilst the other is hidden by a row of scarlet-flowering *Cannas*—very good varieties. Within the fernery, the paths of which are all covered with red tiles, are low undulating rockeries, over which *Selaginella*, *Ficus repens*, and other creeping plants are growing. It is thickly planted with such things as foliage *Begonias*, Ferns (chiefly *Nephrodiums* and *Nephrolepis*), *Crotons*, *Dracenas*, and many small Palms; a few *Aerides* and *Saccolabiums* hang from the roof, in good condition, and some pans of *Nephrolepis philippinensis* and *Adiantums*, chiefly *tenerum*. *Sanchezia nobilis variegata* is represented in this house, but is not highly coloured. One corner, planted entirely with *Alocasia Jenningsii*, is very pretty. The lawn between these long beds is laid out with large circular ones of *Roses*; many dozens of these *Rose* beds surround the pavilion.

Keeping to the right of the pavilion, towards the exit in the direction of the *Pikandra Bagh* and the Horticultural Gardens, one passes a fine single specimen of *Podocarpus chinensis*, in grand condition. On the right of the road near here, leading to the exit, is another small piece of statuary, shaded by a *Nim* tree, with *Poincianas* and some large *Ficus elastica*, single specimens, close by. At this point a mass of *Acalypha musaica*, in the angle of a shrubbery, affords a pleasing piece of colour.

On the left, close to the exit, lined on each side by thick bushes of *Bignonia stans*, is a plantation of tall *Eucalyptus rostratus*, some 60 feet high; the whole group, with some smart pieces of *Biota orientalis* beneath, is very effective. A big mass of *Beaumontia grandiflora*, some 6 feet high and several feet through, is close by, in fine condition; behind it are some tall isolated specimens of *Pinus longifolia*, with their long greyish-green drooping foliage.

Passing through the exit in this direction, along a road several hundred yards in length, lined on both sides with a fine row of *Bignonia adenophylla*, a fine avenue tree before referred to, one soon reaches the *Pikandra Bagh*; it is, however, worth while to make a slight détour to the left, to see a plantation, several acres in extent, of *Eucalyptus citriodorus*. Most of the plants are very young—only a few feet high, but in one place some older specimens have shot ahead. The stems of these are tall, thin, and straight, without a single branch, the heads being also small, and but scantily clothed with foliage; it certainly is not an ornamental tree as I saw it there.

On the opposite side of the public road, running alongside the *Sikandra Bagh*, is the commencement of the fruit and vegetable gardens, generally known as the horticultural gardens, also under Mr. Ridley's jurisdiction. The first fruit grove is a nice plantation of *Malta Oranges*, the bushes quite weighed down with fruit, many scores on each. At the end of this plantation is the vegetable garden, in which

all kinds are grown. On each side of the narrow paths, with which it is intersected, were channels for irrigation.

Passing from the vegetable garden through another plantation of *Oranges*, one comes to another piece, evidently just planted, 12 feet apart in the row, 4 feet between each row, planted diagonally. A plantation of *Loquats* beyond is particularly fine, and there is another of *Peaches*, bushes some 12 feet high. English varieties are, I think, not grown, anyhow they are not offered for sale; those they have, it is found best to transplant in December. In front of the *Peach* plantation is a row of an old Ceylon friend, the *Jack-fruit* (*Artocarpus integrifolius*).

Close here is a strip of ground, with a narrow path in the centre, between two young rows of a very pretty tree—*Polyalthia longifolia*. In this strip of ground are numbers of pots of seedlings, mostly annuals, all kinds seeming to be grown. I noticed pans thick with *Marigolds*, *Nasturtiums*, *Poppies*, *Phlox*, *Petunias*, and many others. In pots, ready for sale, were numerous plants, little groups of each, labelled both in English and vernacular. Behind this is a plantation of *Litchis*, whilst a large one containing all the best varieties of *Mangos* is close by. Round the *Mango* bushes are many hundreds of young inarched plants not yet cut off.

On approaching from that portion of the nursery where plants in pots are ready for sale or planting out, one passes by a triangular piece of grass, along one side of which are some nice *Cupressus funebris*, about 8 feet high, with masses of the stiff-growing, short-foliaged *Yucca serrulata* behind. Here is a pretty fernery, &c., also covered with stems of the useful *Mouje-grass*. The front of the house is covered with *Ipomœa palmata*, prettily flowering; whilst exactly opposite it are two small *Araucaria Canoinghami* some 30 feet high. Behind the house is a splendid piece of *Arenga saccharifera*, some of its tall stiff leaves being 20 feet long; whilst opposite is a *Bougainvillea* trailing over a fine piece of *Albizia procera*, which cannot be less than 50 feet high. The side of the house nearest, and but a few yards from the road, is hidden by a thick hedge of *Calotropis alba*, a most useful stiff-growing plant for the purpose.

The house contains many plants in pots on brick beds ready for sale, and many planted out on the low rockery, with which a portion of the house is filled. Palms, foliage *Begonias*, Ferns, *Crotons*, and *Dracenas*, are those mostly one sees. In the centre of the house are two *Brownea grandiceps* planted out; they have already pushed through the roof, and will soon be too large for the place.

Leaving the house, and following the short path straight to the main road, one passes on the left a good thick plantation of *Biota orientalis compacta*, some twenty plants in all, 8 to 10 feet high, in good condition.

Ascending a short flight of steps, the path, at the top of which has a bed on each side planted with a few rows of *Croton bicolor*, *Russellias*, *Hibiscus*, and *Cannas*, the main road and exit is soon reached. A small path leading from the house by the side of the *Shah Najuff* is shaded on one side by tall *Millingtonias*, with *Hibiscus* beneath, and on the other by a shrubbery edged with *Alternanthera*. *Pilea muscosa* is also used as an edging plant.

James H. Veitch.

(To be continued.)

THE ALPINE GARDEN.

SEDUM MAXIMUM.

This is a grand plant in autumn, though I cannot find it anywhere, either figured or recommended. Nearly all visitors who see it in my garden admire it, and ask for it, but few get it, as it must be grown from cuttings in spring [or tubers. En.], when it is obscure and forgotten. It grows from 2 to 3 feet high, spreading its stems from the base. The stalks and the veining of the large, deep green, fleshy leaves, are deep brown-red; the flowers are in some individuals pale green, in others whitish with a brown centre. There is some confusion about the limits of this species, which *Linnaeus* described as *S. Telephium*. I find in the *Dictionary of Gardening* a fine variety described as a native of Portugal, but in *Willkomm's Flora of Spain* it is specially excluded from the Spanish Peninsula; and *Nyman*, in his laboriously-

compiled *Conspectus of the European Flora*, gives no habitat for the species westward of the meridian of Paris. I enclose specimens of two varieties. *C. Wolley Dod*, *Edge Hall, Malpas*. [See *Gardeners' Chronicle*, September 14, 1878, p. 336.]

COLONIAL NOTES.

TRINIDAD.

Mr. HAAR, in his Report of the Royal Botanic Gardens, asserts that the mortality of a tropical town is not so great as is generally alleged. "It can," he says, "be proved beyond dispute, that the death-rate from zymotic diseases is generally much higher in London than in Trinidad. Fever and malaria have," he continues, "practically no existence."

The practice of shipping the best native *Orchids* for commercial purposes will soon exterminate the best varieties. Seedling *Sugar-canes* are shown to be more vigorous than those from cuttings.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

PEACHES AND NECTARINES.—Trees in late houses should be given every available means to aid them in ripening their wood. When the fruit is gathered, all weak or superfluous growths must be thinned out, that light and air may be admitted freely to those intended to carry next year's crop, and any of the shoots still growing may have their points pinched out. In cases of exceptionally unripe wood, not infrequently met with in young trees, it is desirable to maintain a little fire-heat in the house during the day, with the ventilators standing open. When following this treatment, it is necessary to exercise a vigilant eye on both root and branch, in order that the former should not be limited in its supply of water, and to guard against red-spider finding a resting-place upon the latter.

YOUNG TREES making strong unfruitful wood may now be root-pruned. By attending to this at once, the plants will be enabled to form fresh root-lets before the fall of the leaf, and secure a fresh hold on the border. To successfully accomplish this work, the operator must be able to gauge the amount of check requisite to prevent further growth this year, and at the same time afford the plants the means of maturing those already made. Use forks for removing the soil, and employ a knife for cutting the roots. The present is also a good time for transferring young trees from outside walls to quarters under glass. Whenever the roots have been disturbed by pruning or transplanting, be careful that the soil is not allowed to become dry. In fact, they should be watered frequently, as their demands on the restricted area permeated by their roots will be great.

EARLY HOUSES.—The trees should be looked over, and the borders well-watered if there be any indication of dryness. Manures should still be supplied when watering if feeble subjects are being dealt with, and continued so long as the foliage remains green. More-vigorous trees, however, will be better without any stimulant, as it is possible to exceed, by over-feeding, the limit which marks the maximum of productiveness.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

POTTING-UP BEDDING PLANTS.—The potting-up of bedding plants struck in the open should be performed forthwith, 3-inch pots—having a piece of crock and a few half-rotted leaves, or a bit of moss, in the bottom for drainage—is the size most suitable for *Pelargoniums*, employing a light sandy mould in potting. Afford them the protection of cold frames or pits, and keep them close for a few days until the roots have taken to the new soil, when the sashes may be removed during favourable weather to insure a sturdy growth in the plants.

LOBELIAS.—Those having a good strain of *Lobelias* should pot-up a dozen or two plants from the mixed beds for propagating in early spring. Take the plants up with nice balls, and place them

in pots $4\frac{1}{2}$ or 6 inches in diameter, using light sandy mould, and about $1\frac{1}{2}$ inches of small crocks. Place the plants in a cool pit, where they can be shaded and kept close for a few days, until re-established, when more air should be given them. Before potting, cut away all flower-stems and straggling roots. The plants must be kept in a somewhat cool and airy temperature during the next four or five months, so as to prevent them from making growth before cuttings are required.

CALCEOLARIAS, ETC.—Cuttings of Calceolarias, Leucophytos, Gnaphaliums, Violas, and Pansies, that strike and winter best in cold frames, should now be obtained, lest the young growths get injured by frost. A shallow frame, placed on a hard surface of gravel, or clinkers covered with cinders and coal-ashes, in front of a south wall or fence, is best. Put a layer of short dung, to the thickness of about 2 inches, in the bottom, following this with 2 or 3 inches of light loam, and a surfacing of sand. In this, insert the cuttings, which should be from 2 to 3 inches long, sturdy, and short-jointed, in rows about 4 inches asunder, and at the same distance from plant to plant, making the soil about them firm with the dibber. Give them water to settle the soil, and keep the frames close for a time until the cuttings have callused, when a little air may be admitted. As soon as they show signs of being rooted, admit plenty of air to them on all favourable occasions, drawing the sashes off, and replacing them at night, the object being to prevent them making much growth before spring.

RESERVE GARDEN.—Any weeds that show among the plants in the reserve garden, should be pulled up. Should mildew appear on Violas, Pansies, &c., dust the affected leaves, while damp, with flowers-of-sulphur.

GENERAL WORK.—Gladiolus and Lilies have been making a good show for some time past, the former being unaffected by the recent heavy rains, and they should be freshly labelled before the flowers and stems die off. Note should also be made of any seedling flowers that may be worthy of preservation. Keep flower-beds well picked over, so that they may look bright and tidy until nipped by frost, and keep all tall plants well, but not too tightly, secured to the stakes.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

TEMPERATURE, WATERING, AND RESTING.—Phalænopsis are maturing their last leaf for this year, and the Calanthes pushing up their flower-spikes; and in order that the former may finish properly, and the spikes of the latter be well advanced before the dull weather arrives, the temperature should range from 70° to 75° . For other East Indian subjects, 65° to 70° will be sufficiently high. I have before remarked that the Calanthes should be placed near the glass, and that they will withstand and benefit from full sunshine; and the Phalænopsis are best when suspended near the roof, being rather heavily shaded. Special care should be taken of Phalænopsis at this season, or an unnecessary loss of leaves may occur, owing to a too sudden exposure to strong light—I am referring to the maturing of the new growth. It will be understood that East Indian Orchids cannot endure the rigorous treatment which is found to suit Mexican species, but still a lesser degree of ripening may be brought about by exposing the plants to the sunlight gradually, by reducing, as the season advances, the supply of water at the roots and in the air, and admitting as much air to the house as can safely be done.

THE CATTLEA, MEXICAN, AND INTERMEDIATE HOUSES.—The cool autumn night-air braces and strengthens all species of Orchids growing in these houses, the slender new pseudobulbs increasing in sturdiness, and new roots are thus profusely emitted, while the foliage becomes bronzed, or of an intense green colour. It is well to defer the use of the heating-apparatus till the last moment, 60° to 65° with air being a good night temperature, and that can be secured at present without artificial heat; but, should the temperature go below 58° , it must be employed.

THE ODONTOGLOSSUM-HOUSE.—At this season these plants are greatly strengthened, and if the condition of the roots is good, and the foliage is free from thrip, the plant will grow freely for the next two months. A night temperature of 55° , with air

freely admitted, and careful watering of the plants, will effect all that is needed.

THE DENDROBIUM-HOUSE.—A night temperature of 70° is necessary for a few weeks longer, a few species yet remaining which have not completed their growth. Many species are already at rest, and the greater number will soon be ready to be removed to the resting-house.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

CURRENT WORK.—With a heavy rainfall in most parts, the ground will be in a saturated condition, and seed-sowing and other necessary work will have been delayed; but no time need be lost, as there are always some arrears of work to fetch up in surface-cleaning the ground where young crops are growing, and in that way accelerating growth. Every advantage should be taken of dry days to hoe all vacant as well as occupied land. The harvesting of the Potato crop will now require attention. So far, I have not found any advantage is gained by leaving the tubers in the soil, especially where shaded with trees, after the decay of the tops; indeed, the reverse is the case, as wireworms and disease often cause much loss. When storing, get the tubers as dry as possible before gathering them up, and do not expose them unduly to light. Heavy and good crops are the rule this season. Seed-beds of Lettuce and other plants will require frequent dressings of lime or soot, to prevent the ravages of slugs in damp weather, and should any of the seed have failed to grow, more should be sown on sheltered ridges, where they may get slight protection in severe weather. There are few better Lettuces for standing the winter than Hardy Hammersmith and Brown Cos. No delay should occur in getting the crop of spring Onions under cover as soon as growth is finished, as if left too long they will not keep sound. The bulbs, when placed in fruit-houses in which the fruit has been gathered, should be staged on racks or shelves, not on the damp soil, as when on the latter, and they lay at all thick together, they soon decay. Turn them on wet days, and sort them ready for storing. If early Leeks are required, the earliest lot should be dressed with soot or fish-manure, and if the land be dry, afford a thorough watering previous to earthing them up. It is also advisable, with the short thick-growing varieties, not to add all the soil at one time, but to do the work at intervals. Early-sown Endive will now be fit for blanching, which may be performed by tying them up, or placing a flower-pot over them, or a piece of slate or tile. Later sowings should be planted-out when large enough. The thinnings of Parsley, if carefully lifted and planted in frames or on raised beds, where protection can be afforded them in severe weather, may still be planted.

SALADS.—Those who have to provide these through the winter can often make up various corners for the autumn supply, so as to leave the plants in frames to the last; and there is much gain by choosing a variety of positions for the last supplies from the open, the produce not then coming into use at one time. In the open, blanched Lettuce is often killed by frost, whereas in sheltered corners, it will often escape the early frosts. The plants for winter supplies should be planted out in their permanent quarters as soon as ready.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

CHRYSANTHEMUMS.—To have small examples of these in 4 or 5-inch pots, layering in pots should be practised, the shoots being taken from the surplus stock which was planted in the open ground in the early summer months. The pots used should be filled with rich sandy compost, and sunk up to the same in the soil of the borders. When the buds are well set, is the best time to layer them; strip a few leaves from the portion of stems to be covered with soil, and fasten them down with a stout wooden peg. The soil should be kept moist to encourage the shoots to send out roots, which will take place in about one month. When rooted, sever the layers from the parent plants, and place them in a cold frame, which should be kept rather close for a few days till they become established, when more air must be afforded.

MIGNONETTE.—To have this in the best condition in the winter, no time should be lost in sowing

seed. Pots about 7 or 8 inches in diameter are the most useful size, and these should be well-drained, filling them up to within 1 inch of the rim, with a rich compost consisting of two parts loam, one each of leaf soil and decayed manure, with a dash of silver sand and finely-broken old plaster or mortar added. Mix the whole well together. Fill the pots with this compost firmly to within an inch of the top, and make the surface level, and sow the seeds thinly and evenly over the surface, covering them only slightly with fine soil. Stand the pots in a cold frame, and keep the soil rather damp by frequently and lightly syringing it till the seedlings appear. Afterwards keep the pots well up to the glass, and admit the necessary amount of air so as to encourage a sturdy growth. Also pay attention to the thinning out of the young plants as growth proceeds, finally leaving them from four to five plants in each pot.

EARLY ROMAN HYACINTHS.—Lose no time in having the required number of these useful bulbs potted off, two or three being put in a 48-sized pot, according to the size of the bulbs; but where large quantities are forced for cutting purposes, shallow boxes may be utilised, the compost consisting of loam two parts, leaf-mould, and rotted cowdung and silver sand. Stand the pots in the open air, in a sunny, but sheltered, position, and cover them with 6 inches of cocoon-nut fibre, or sifted coal ashes. If the soil is in a nice moist condition, no water will be required until they are brought into the forcing-houses.

TULIPS.—These, like the above, should have attention, especially the early forcing varieties, such as the Duc Van Thols, &c.; 5 or 6-inch pots are very useful sizes in which to grow them, placing from five to six bulbs in each, affording them similar treatment to that recommended for Roman Hyacinths. When growth is about 3 inches high, remove them to the forcing houses or pits in batches, according to the demand.

No delay should be made after this date in getting in the required number of Dutch bulbs.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Mereworth Castle, Maidstone.*

GATHERING FRUIT.—This is a matter of daily attention, and should have precedence of other work. When gathering soft fruits, as Peaches and Nectarines, &c., too much care cannot be taken in doing so, the least bruise soon setting up decay. Most, if not all, wall-fruit should be gathered a day or two before it is eaten, being put in the fruit-room for that length of time. If fruit is for bottling, gather it when perfectly dry, and do not bruise it, or the flesh will be discoloured; we always gather the medium-sized fruits and those a trifle under-ripe for this purpose. As fast as the trees are cleared of their fruit, cleanse them of insects with the garden-engine. Should the trees have borne heavily, the soil at the roots may receive another thorough watering with clean water, or, better still, with manure-water. In all cases where the wood of stone fruits has been laid in thickly, and the fruits have been gathered, the trees should be slightly pruned, taking out such wood as has carried fruit, and filling in the vacancies with young shoots that have been reserved for that purpose. I would here remind those who may be intending to plant fruit trees, that they should take note of the most suitable sorts and varieties of fruit to plant when the proper time arrives. Do not overlook Dymond Peach, one of the best Peaches for ripening in the last week of August or the beginning of September.

PEARS.—These should be carefully looked after and gathered at intervals, but the late-keeping varieties should be left on the trees as long as it is safe to do so, for if gathered before they are ready, they not only shrivel, but are rarely fit for table use, the flavour being so poor and the flesh dry.

GRAFTS.—If not already done, some of these may be shortened back to 15 inches from the point of union, and others secured to light rods fastened to the stem of the tree or the branch, as the case may be. Young trees on grass should, if the grass has grown to any length, have the turf round about them mowed off, and the fastenings made secure, so that the bark does not get rubbed; this will oblige, in many cases, some fresh bolsters being placed between the stake and the stem.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, SEPT. 15 } Brighton and Hove Chrysanthemum Society.

SALES.

MONDAY, SEPT. 12 } Great Annual Trade Sale of Stove and Greenhouse Plants at Dyson's Lane Nurseries, Upper Edmonton, by order of Mr. H. B. May, by Protheroe & Morris, at 11. Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs at Stevens' Rooms.

TUESDAY, SEPT. 13 } Great Annual Trade Sale of Winter-blooming Heaths, at the Burnt Ash Lane Nurseries, Lee, S.E., by order of Messrs. B. Maller & Sons, by Protheroe & Morris, at 11 o'clock. Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids and Tree Ferns, at Protheroe & Morris' Rooms.

WEDNESDAY, SEPT. 14 } Annual Trade Sale of Winter Flowering and other Plants, at the Lea Bridge Nurseries, Lea Bridge Road, Leyton, Essex, by order of Mr. John Fraser, by Protheroe & Morris, at 11. Litch Bulbs, at Protheroe & Morris' Rooms. 20,000 Lilium Harrisii, at Stevens' Rooms.

THURSDAY, SEPT. 15 } Annual Trade Sale of Stove and Greenhouse Plants, at the Brimsdown Nurseries, Enfield Highway, by order of Mr. John Maller, by Protheroe & Morris, at 11. Dutch Bulbs, at Protheroe & Morris' Rooms. 20,000 Lilium caudatum at Stevens' Rooms.

FRIDAY, SEPT. 15 } Great annual trade sale of winter-blooming Heaths at the Longlands Nursery, Sidcup, S.E., by order of Messrs. Gregory & Evans, by Protheroe & Morris' at 11 o'clock. Dutch Bulbs at Protheroe & Morris' Rooms. Orchids from Mr. F. Sander at Protheroe & Morris' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 17 } 20,000 Early Roman Hyacinths and 20,000 Narcissus, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—58°.

We have on several occasions referred to the fruit evaporating process which is so universally in use in the United States of America, and is now making rapid progress on the European continent. Last year, it will be remembered by many of our readers that a demonstration was made of its usefulness at the Royal Horticultural Gardens at Chiswick, of which we gave an account in these columns. Lately, in the *Times* and several of the leading London daily journals, attention has been drawn to the process, and frequent enquiries are being made which tend to show that interest is gradually being awakened in the minds of at least some of our fellow-countrymen in a subject which concerns them very directly. But at present the fruit evaporator has not taken any direct hold of the minds of English fruit-growers. This is probably due to our insular caution in part, but perhaps more to the fact that very few English people are at present aware what fruit evaporating can do for the fruit grower in an economic point of view.

This season so far does not give much promise of superfluous crops of our hardy fruits, and so it may seem inopportune to draw attention to the fruit evaporator at the present time, but we think we can show that this is just the proper time for its claims to be considered. The present autumn will not be a busy time for most fruit growers. They will, consequently, have more time to enquire about this transatlantic appliance for making the best of their fruit crops. As our orchards will, in all proba-

bility, be lightly laden this year, there is the more reason for supposing that twelve months hence they will be more prolific, and if we can show that fruit evaporating is a sound reliable method for converting our perishable fruit crops into a commercial commodity which may be preserved in good condition for months or even years, we may perhaps induce some of our readers to consider whether it would not be to their interest to provide the means for meeting the contingency of a glut of fruit whenever it occurs, let it be next year or later.

There is another point worth mentioning. If our view is correct, the fruit evaporator should stimulate fruit growing in this country. If evaporated Apples, Pears, &c., once get into regular demand in the United Kingdom, there can be no doubt as to a large quantity being required to supply the market; and we can see no reason why our own orchards should not produce a large part of this supply. At present, hardly fruit-growing in England, in many districts, can scarcely be considered a business pursuit, by which we mean that it is not carried on as most successful businesses are. There are, to mention a single illustration, thousands of trees which might be judiciously grubbed up, and their places taken by newer and better varieties, of which we, fortunately, have a superabundance to choose from. No one familiar with the orchards of Worcestershire, Herefordshire, or Devonshire, will doubt this statement for a moment. The most popular and paying kinds of Apples, Pears, and Plums grown in the market-gardens around London, are practically unknown in the provinces, and yet these are the varieties which ought to be grown universally. Slowly information is spreading, but it takes a long time before inferior old kinds of Apples and Pears get replaced by the newer and better kinds in the orchards of the midland and southern counties. Let any one who doubts this statement, test it, by paying a visit to the fruit-growing counties outside the influence of the metropolis, and we have confidence that our opinion will be confirmed. Any competent person could easily compile from the valuable publication on "British Apples," which constitutes the Report of the Committee of the National Apple Congress, held in the Royal Horticultural Society's Gardens, Chiswick, in October, 1888, an unimpeachable list of culinary and dessert Apples, which might be planted everywhere suitable for Apple-growing in this country, with every reasonable prospect of success.

Inferior or unprolific kinds of our hardy fruits should be got rid of as soon as possible, and their places taken by such as can be relied upon. Worthless kinds should be either displaced or headed down, and grafted with better sorts. New plantations should consist of such of the better sorts as are found to thrive in any given locality. Were these two courses adopted, universally hardy fruit-growing would soon assume a position in this country which would be full of hopeful promise for the growers.

But there is another point to be thought about of considerable importance. If our fruit-growers were to act upon this advice, we should have now and again years when more fruit would be grown than a market could be found for in its natural condition, and the consequence would be supplies greater than the demand. It is at this stage that the fruit evaporator comes in to help us. It is proved by many years' experience in the States that evaporated fruits are wholesome, preserve their flavour, are available for pies, tarts, compotes, &c., which cannot be dis-

criminated from those made from fresh fruit, and can be put on the market at readily saleable prices whenever it suits the producer's purpose to offer them for sale. In the last clause of this statement is the gist of the matter. Our perishable fruits can, without question, by means of the evaporator be rendered practically imperishable, and it only needs British skill and perseverance to produce them with economy, so that they may advantageously compete with similar products from America.

We commend the thoughtful consideration of this subject to all concerned, and we may say in conclusion, that any of our readers who may desire further information as to the fruit evaporator may, by appointment, see the evaporator at work in the gardens at Chiswick, and can obtain further particulars on application to Mr. A. LUDWIG, F.R.H.S., 16, Mincing Lane, London, E.C.

ROCK PLANTS AT CHISWICK.—The Royal Gardens, Kew, have made a munificent donation to the Royal Horticultural Society of upwards of 200 named plants for the rockery at Chiswick. Now that the public taste has set in, in this direction, this gift is particularly acceptable.

THE CHISWICK GARDENS.—These gardens have looked remarkably well this season, but good looks are of secondary importance as compared with utility. The trials of Asters, Phloxes, Cabbages, Beans, Tomatos, Figs, and other things, are most interesting and serviceable to horticulturists, as the judgments are formed by competent and disinterested experts at various times during the growth of the plants. We can only hope that means may be found for the more speedy publication of the results. At the recent Begonia Conference very many more of the general public attended than at the Drill Hall during the whole year, so that we cannot doubt that, if the nature of the work done at Chiswick were made known more widely, there would be more visitors to the gardens. A great deal has been done during the last year or two to renovate and restore what had been allowed perforce to go to ruin in the had times not many years old.

NATIONAL CHRYSANTHEMUM SOCIETY.—A fully-attended meeting of the Committee took place at Anderton's Hotel, Fleet Street, on the 2nd inst., Mr. R. BALLANTINE in the chair. The chairman reported that designs had been selected, and the order given for the two HOLMES' Memorial Challenge Cups, offered for competition at the great show in November. Mr. C. HARMAN PAYNE reported that the Catalogue Revision Committee had met and made arrangements for the preparation of a supplemental catalogue, which they hoped would be ready by the October exhibition. A letter was read from Lord D'ISLE, consenting to have his name announced as one of the patrons of the society. A considerable amount of correspondence was read from affiliated and other societies, bearing upon the preparation of prize schedules. Nine new members were elected, including one Fellow, and the Stockport Chrysanthemum Society; the Borough of Loughton Chrysanthemum Society; the South Shields and Northern Counties Chrysanthemum Society; and the Lizard Chrysanthemum Society, were admitted to affiliation.

RATING OF GREENHOUSES.—In reference to this matter, which is an important one to many of our readers, and with regard to which some replies to correspondents have appeared in our pages, we publish the following letter:—"By Section 211 of the Public Health Act, 1875, the occupier of land used as a market garden or nursery-ground shall be assessed in respect thereof, in the proportion of one-fourth part only of the nett annual value. The case mentioned in the *Gardeners' Chronicle* of August 13 is exactly similar to the case of *Purser v. The Local Board for*

SHOOTS OF A GIGANTIC BAMBOO, CEYLON.

Worthing, in which case PURSER, the appellant, erected greenhouses or glasshouses on his land, and used same for the purpose of growing fruit and vegetables for sale in his business; and it was held that such land with the greenhouses upon it constituted a market garden or nursery-ground within the meaning of the above section of the Public Health Act, and that the appellant, PURSER, was liable to be rated to the general district rate in the proportion of one-fourth part only of the nett annual value of the property (that is, the land with the greenhouses thereon). CHARLES BUTCHER,

"Solicitor for the Nursery and Seed Trade Association, Limited."

CHICAGO EXHIBITION.—It is the intention of the Colorado World's Fair managers to distribute to visitors to the Colorado building some souvenir, which may be a valued reminder of the State. One design meeting with unusual favour has the State flower, the blue Columbine, mounted on a convenient-sized card, together with a Fern, or spray of green leaves. The wonderful beauty of the Colorado wild flowers is world-renowned, and every visitor would be pleased with such a souvenir. Added to this there will probably be a small specimen of mineral quartz, topaz, or stone, from some historic spot, such as Pike's peak. An effort is being made to secure for exhibition in the Horticultural Department of the World's Fair, a specimen of giant Cactus from the desert region of south-east California. This Cactus grows at times to a height of 70 feet. A specimen, when boxed ready for shipment, will weigh eight tons, and it will require an expenditure of something like 2,500 dollars to deliver it in good condition to Chicago. Ten Almond trees in full bearing will be transplanted in the Exposition grounds at Chicago from San Joaquin county, California. They will be furnished by P. B. ARMSTRONG, President of the ARMSTRONG Fruit and Nut Company, which owns an orchard of 1015 acres—one of the largest in the world. Mr. ARMSTRONG will also make a display of Peaches, no one of which will be less than a foot in circumference.

M. JOLIBOIS.—The *Revue Horticole* announces the sudden death of M. Jolibois, the head gardener at the Luxembourg, Paris, and well known to orchidists and cultivators of Bromeliads. He was the raiser of a large number of hybrid *Cypripediums*.

SHREWSBURY HORTICULTURAL FÊTE.—The attendance here was remarkable, and the total receipts from all sources, £3700. The weather on the first day was all that could be wished, but up to 12 o'clock on the second day it was very doubtful, but it cleared up soon after 1 o'clock, and was fine afterwards, 40,000 persons paying at the gates, and with the holders of cheap tickets purchased beforehand, about £750 worth, subscribers and assistants, fully 53,000 persons were present, and everything passed off to the entire satisfaction of all. An enormous amount of work falls upon Messrs. ADNITT and NAUNTON, several hundreds of letters having to be opened and attended to, but eighteen years of their joint experiences as Hon. Secretaries has enabled them to fit their work into a system, and all goes merrily and well.

LARIX LEPTOLEPIS.—Messrs. PAUL & SON, Cheshunt, send us cones of this Japanese Larch from their High Beech Nursery. In general appearance it is like the common Larch, but the scales of the cones are rolled back at the ends.

RED CLOVER IN NEW ZEALAND.—Red Clover grows in New Zealand with great luxuriance, but until recently it was necessary to import all seed from England. DARWIN showed that the plants can be fertilised and made to produce seed only through the agency of bumble bees, and, as these creatures were unknown in New Zealand, attempts were made to introduce them, and they were finally, about ten years ago, carried the entire journey alive, while in a torpid state, in freezing chambers. Since then (remarks the *Colonies and India*) they have multiplied, and the red Clover bears seed.

MICHIGAN FLORA.—Under the auspices of the State Board of Agriculture, Dr. BEAL and Mr. WHEELER of the Michigan Agricultural College, have prepared a list of plants found wild within the limits of the State—a State nearly surrounded by the great lakes, which render the climate more equable than it otherwise would be, and having an area of 58,915 square miles. Various interesting notes relating to the geology, the distribution, the fitness of certain plants for cultivation and other purposes, are appended, which show that botany is not the dry uninteresting study that some folks imagine; the dryness rests with the student rather than the subject.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The accounts of the annual show of this Society, held on August 18, 19, and 20, have now been made up, and show a surplus of over £500, after paying the 50 per cent. additional prize-money which was promised by the directors on the condition that the *file* proved a success. The acting directors are to be congratulated on the excellent result attending their labours. The surplus last year was £60.

CATTLEYA AUREA.—Messrs. F. SANDER & Co, send us specimens and a coloured drawing of a four-flowered inflorescence of a *Cattleya* received by them from G. LE DOUX, Esq., of East Moulsey. The peculiarity consists in the circumstance that each of the four flowers differs more or less from its neighbour, especially in the coloration of the lip. The lower flower has the lip of a rich purple at the base, and at the free end, which is deeply two-lobed, the disc is golden-yellow, with a narrow margin of purple. The second flower is similar to, but not quite like the first. The third flower is much larger, and is considered by Messrs. SANDER to represent a fine form of *C. aurea*. The sepals and petals are pale primrose-yellow, the lip rich purple, with radiating veins of a golden hue over the inner half of the lip, and the free end of a rich purple, the margin waved and frilled. The uppermost flower is of large size, has the two extremities of the lip purple, with radiating golden lines at the base only, the disc is golden-yellow margined with purple.

PRESTON AND FULWOOD HORTICULTURAL SOCIETY.—At the monthly meeting of this Society, held on Saturday, there was a large attendance of gardeners, professional and amateur, and it was claimed by some that these meetings are second only to those of the Royal Horticultural Society, so far as regards the excellence of the papers read and the interest taken in the proceedings. It is certainly the most important society of its kind in the north of England. At the gathering under notice, a paper was read by Mr. S. H. SCOTT, on "Rose Growing near Large Towns," and to illustrate his points, he had on exhibition a fine collection of plants. One stand contained twenty-four distinct varieties, and another stand was composed of twelve distinct hybrid perpetuals of remarkable beauty. The other exhibits were up to the average. The MAYOR (who was recently elected to the presidency of the Society), occupied the chair at the meeting.

PROLIFEROUS DIGITALIS.—Mr. STANTON, of Park Place Gardens, H-nley, sends us specimens of *Digitalis ferruginea*, in which the inflorescence is more branched than usual, and in which each flower is wholly of a green colour, with calyx, corolla, and stamens otherwise normal, but the place of the pistil is occupied in each case by a shoot bearing numerous small leaves and rudimentary flowers. This is probably the result of excessive development of the vegetative system as compared with that of the reproductive organs.

WINCHESTER AND DISTRICT GARDENERS' IMPROVEMENT ASSOCIATION.—A number of the members of the above, had their first annual outing on Wednesday, August 31, paying a visit to Messrs. SUTTON & SONS' seed establishment and seed farms, at Reading, and to the Reading Flower Show, which was held on that day. The party returned to Win-

chester in the evening, after spending a pleasant and profitable day.

ASTER TRINERVIUS.—The *Revue Horticole* gives a figure of a real China Aster, which is wonderfully like its North American congeners. It has oblong, remotely-toothed leaves, and terminal panicles of flower-heads, with lilac rays, and yellow-disc florets; a description which would apply to numberless American forms, but the venation is said to be tricostrate, though hardly so represented in the plate. The plant is extremely variable, and some forms of it are much better than others. It was introduced from Canton by M. LOUIS PAILLET, nurseryman, of Chatenay, Seine.

"PITCHER" GROWTHS ON CABBAGE-LEAVES.—Everyone who has visited the Royal Gardens at Kew, is familiar with those curious types of vegetation which are popularly called "Pitcher-plants." Not everyone, however, is aware that one of the commonest English garden plants, viz., the Cabbage, will sometimes develop these ascidiform structures. In BONNIER'S *Rev. Gén. de Bot.*, iii., p. 33 and p. 337, there are two papers by Mr. W. RUSSELL, in which several instances are described and figured of this curious growth on Cabbage leaves. One instance is of a funnel-shaped pitcher, which may be compared to a leaf with a long stalk which has been rolled upon itself, the margins having become more or less completely united. Another case is of a pitcher-like structure springing from the upper surface of the leaf. From the arrangement of the vascular bundles, RUSSELL regards these epiphyllous pitchers as examples of the doubling of a normal leaf.

VERNONIA PODOCOMA.—A shrubby Composite, with large cordate ovate acutely-toothed leaves, and large loose terminal panicles of pinkish flower-heads, giving the same effect as the flowers of *Valeriana officinalis*. It is a native of tropical Eastern Africa, from Abyssinia to the Zambesi and westward in Angola. It flowered last winter in the succulent-house at Kew. *Bot. Mag.*, t. 7255.

M. RODIGAS.—We learn with great pleasure that the French Government has nominated M. RODIGAS, the Director of the School of Horticulture of Ghent, a "Chevalier du mérite Agricole." Our eminent colleague is indefatigable in his labours for the advancement of horticulture.

TULIPA BILLIETIANA, figured in the last number of the *Botanical Magazine*, t. 7253, is a native of Savoy, with yellow flowers, the three outer segments acute. It flowers earlier than those of the *Gesneriana* section.

THE GREEN ROSE.—An American monthly says:—"Some of our contemporaries are interested in the existence of a green Rose. This has been a very well-known plant in the vicinity of Philadelphia for probably a century. There is no essential difference between the petals of a Rose and a Rose leaf, and the transformation of one to the other in Nature is very easily accomplished. A green Rose, therefore, is nothing more than a Rose in which in forming the flower the Rose has persistently refused to allow its leaves to be transformed to petals—they still continue as leaves. Outside of its interest as showing the relation between leaves and flowers there is no other interest in the green Rose. Certainly, it has no beauty."

ELECTRIC HEATING.—MM. GUSTAVE OLIVET & Co., of Geneva, according to the *Revue Horticole*, have devised a plan of heating which, if it answers in practice, will have great advantages. An electric current is generated by a dynamo, as for the electric light, and conveyed to a metal receiver, which speedily becomes hot, and diffuses heat where required. The advantages are absence of all deleterious gases, complete security, uniform temperature, capable of regulation at will, facility of conversion into light when required, by means of a "commutator;" absolute cleanliness, and facility of transport. Once the dynamo is in position with its conducting wires,

the heating apparatus is very inexpensive, not costing more than ten francs. We hope we shall soon hear more of this system of heating, which appears to us very practicable, and if so, it will need no recommendation to those who have to look to the fires.

GLOXINIAS.—We have lately had several specimens submitted to us of Gloxinias, in which the central leaves of the tuft were black and rotten. No trace of insect or of fungus was observable, though the rotten condition suggested the presence of bacteria, or of some mould-like Peronospora, and these may still ultimately be found. Our French friends suffer from the same plague, and treat it, according to the *Revue Horticole*, by cutting out the affected parts, and dusting the wound with charcoal and lime in equal proportions.

THE UNITED STATES.—It is rather discouraging, from an American point of view, to find that, so far, at least, foreign horticulturists show a greater interest in the Exposition than those in this country. At the recent convention of the Society of American Florists, Mr. THORPE, Chief of the Bureau of Floriculture, called attention to this fact, impressing upon the Society the need for prompt action, since European exhibitors have already called for far more space than Americans. A large collection of hardy Roses is already sent in by an English grower, with the intention of providing a grand show next June. The horticultural building is of such immense size, that the effect of ordinary decorative plants would be entirely lost, especially under the lofty dome. To obviate this difficulty, a miniature mountain of rockwork is being erected; it will be 60 feet in height, having a base 80 feet in diameter. The present intention is to begin the spring exhibit with early bulbs, followed by Pansies, the latter flower—which is the greatest of all spring favourites in America—being used in very large quantities. Roses will follow in June, Gladioli in August, while the early autumn is to be brilliant with Chrysanthemums. In planting perennials for permanent effect, the winter climate has to be considered, the cold usually being very severe, intensified by the cutting late winds. California, always a land of great things, promises to furnish an entire Orange grove; it will fill a train of twenty-five cars in transportation, while among the promised trees are a Date Palm 25 feet high, and a San Diego Palm 50 feet in height. One of the most promising landscape features in the vicinity of the Horticultural Hall is the "Wooded Island," an irregular islet, containing about 16 acres. This was originally a bit of dreary swamp, only relieved by a few scrub Oaks, but it is now being formed into a charming wild garden. The design is to make a display of native herbaceous plants as the chief feature, though a few foreign plants will be admitted, all of the herbaceous class. Surrounding the island is an aquatic garden. The collection of Irises on the island will be extensive, and promises a fine show for spring and early summer. The hardy herbaceous plants which we see here are not yet fully appreciated in America, and the wild garden is almost unknown, so Mr. THORPE'S "Wooded Island" is likely to prove quite a missionary effort. *E. L. Taplin, Chicago, U.S.A.*

BOOK NOTICE.

THE GENUS MASDEVALLIA.*

IN this part, Miss Woolward gives us the third decade of her drawings and descriptions of the species of this striking Orchid genus. We hear she is well on with material for Part IV., so that timid subscribers who shrink, perhaps not without reason, from taking up a new venture, may feel assured that the present work will be well carried through. The coloured drawings and dissections are as faithful as ever, and for accuracy of description and fulness of information, the text maintains the standard of excellence of previous parts, while a slight alteration in the mode of insertion of Consul Lehmann's notes on the habitat of those species he has been able to study in their native homes, will prevent mistakes as regards authorship for the future. In Parts I. and II., the authoress, anxious to give full credit for the help, had Lehmann's notes printed at the end of her descriptions, and appended his signature. To a careless reader, the signature might seem to govern the whole description, a view adopted in an important continental herbarium, where the work was catalogued as "Lehmann's *Masdevallia*." With the present arrangement, this will be no longer possible.

Two of the most well-known species are discussed in Part III., *M. caudata* and *M. coccinea*. The former is perhaps better known as *M. Shuttleworthii*, a species of Reichenbach, which, like various others of the eccentric professor, will not stand the light of investigation. The colour variety *xanthocorys* is also figured, and a short account is given of the hybrids in which *caudata* takes a part.

The brilliant *M. coccinea* is one of the most abundant and variable species. *M. Lindenii* and *Harryana*, which are mere colour forms, may be seen at every show where Orchids are included. It certainly deserves its native name, "La Banderita," "the little flag." *M. coriacea* forms the type of a well-marked section, many members of which, as first pointed out by Miss Woolward, have large nectaries at the base of the lip; this is carefully figured in the present instance. Under *M. Estrade* is included another of Reichenbach's species, *M. ludibunda*, which Miss Woolward considers only a variety of the first, and the differences are certainly very slight. The variety is figured, but not accounted for in the explanation of the plate. The other species contained in Part III., are *M. Armini*, *M. Carderi*, the brilliant yellow *M. Davisii*, *M. polysticta*, an extremely variable species; *M. triangularis*, and, lastly, the pretty little *M. Wageneriana*. *A. B. Rendle*.

HOME CORRESPONDENCE.

THE WHITE-FLOWERED FUCHSIAS.—The first batch of Fuchsias with white corollas was distributed by Messrs. E. G. Henderson & Son, then at the Wellington Road Nurseries, St. John's Wood, in 1855. They consisted of two raised by Mr. Story, viz., *Mrs. Story* and *Queen Victoria*, each of which were announced at one guinea per plant; and three others, viz., *Empress Eugénie*, *Lady of the Lake*, and *Water Nymph*—these were priced at half-a-guinea each, no raisers' names being affixed to the

three last-named, but it was generally believed they were also raised by Mr. Story. *Mrs. Story* was figured in the *Florist* for 1855, and it is stated therein, as accounting for the origin of this type of Fuchsia (*Mrs. Story* being then dead):—"It is believed that Mr. Story obtained pollen through Mr. Veitch, of Exeter Nurseries, from a species with a small and almost white corolla, and transferring it to a dark variety, obtained ultimately the batch of seedlings of which *Queen Victoria* is one." The species alluded to as that from which pollen was obtained died shortly after it had flowered. As far as my memory serves me, the actual fact was, that Mr. Story, some years before, raised a small-flowered Fuchsia, which, beyond having a white corolla, was considered of no value; it, however, served the purpose of inspiring its fortunate owner with a desire to improve it; and by well-directed operations, and after a few generations of seedlings, varieties possessing improved form, good substance, and commendable habit rewarded the skill and patience of Mr. Story, as was seen in *Mrs. Story* and *Queen Victoria*. I was at the Royal Nursery, Slough, in 1855, and I remember the great interest aroused by the advent of these Fuchsias, and how novel and distinct they were considered when they bloomed. But they were at first spare growers and somewhat shy bloomers—defects which were soon remedied in succeeding years. In the following year (1856), the first double white-petalled Fuchsias put in appearance, viz., *Galanthiflora plena*, which, I think, came from abroad; and *Ranunculæflora*, also raised by Mr. Story; and, by the same raiser, *Countess of Burlington*, single-flowered, also with a white corolla. *Maid of Kent* was sent out in 1855, and *Venus de Medici* in 1856, both raised by Mr. E. Banks, and both still grown as decorative and exhibition varieties. *R. Dean*.

HYBRID BLACK CURRANT × GOOSEBERRY.—Your correspondent (August 6), Mr. Culverwell, is in error as regards his hybrid, as seventeen or eighteen years ago I knew of two large bushes in a garden at Ashford, off which I have gathered and eaten fruit. These two bushes were raised from cuttings, brought from the Isle of Wight by the late Dr. Maund, and if my memory serves me truly, his father raised the hybrid there. The parents were Black Currant and the small red-rough Gooseberry, but which was the pollen-parent was not known. The branches of this hybrid were erect, sparsely spiny, leaves five-lobed irregularly serrate, and of a dark green colour, glaucous above, and when crushed gave out the unmistakable odour of the "gazel," as we call the Black Currant in Kent. The fruits were axillary, and produced on the wood of the year before, solitary, but occasionally in pairs, and rarely with a small undeveloped fruit at the apex of the bunch, denoting the Currant cross. In colour the fruit was black, or dark purplish-red, slightly pubescent and carrying the withered flower at the point, as the parents do. In flavour they were sweet, but at the same time astringent, and with the pronounced flavour of *R. nigrum*. Last year I tried to get some cuttings of this hybrid for my friend, Mr. T. Laxton, but found to my regret the trees had been destroyed. It is certainly singular that *Rib. nigrum* should hybridise with *R. grossularia*, as Loudon says (*Ency. Plants*, p. 191), "no varieties have been raised of this species, nor will it produce hybrids, as far as at least as has been tried with other cultivated sorts of *Ribes*." *Seneca*.

BEDDING AT KEW.—*Tropæolum Vesuvius* is considered one of the finest bedding plants here this summer, bright scarlet, very dwarf, and free-flowering. *Lobelia King* of the Blues and *L. pumila magnifica* are both good. *Violas*: the best white is certainly *Countess of Hopetoun*, far ahead of *Snowflake*; amongst the yellows, *Ardwell Gem* or *Greivei* is the best; blues, *True Blue*, *Montgomeryana*, and a good light *Pilgrimage Park*. *Queen of the Belgians* is the best white *Pelargonium* for outside work; scarlets, *King of the Bedders* and *Henry Jacoby*; two good pinks are *Titians* and *Mrs. Leavers*. *Carnations*, apparently, do not flourish at Kew. They are great favourites, and many varieties are grown, but *Raby Castle*, and the old crimson and white *Clove* are about all that succeed well. A really good mixed border, near the range of houses (7 to 12); has been very showy all the summer—a feature, indeed. But the recent heavy rains have somewhat marred its beauty. *J. B.*

WASPS.—Seeing the statement in a contemporary, that "it has been calculated that the damage done to ripe fruit alone during a season by the above-

* Issued by the Marquess of Lothian. Plates and Descriptions by Miss Florence H. Woolward. Part III. Price, £1 10s. (Porter, London.)

mentioned pests exceeds one million pounds sterling," one is tempted to suggest remedies. Now, without going into figures, there is no doubt that gardeners, fruit-growers, and others, do suffer almost incalculable loss from the ravages of wasps, whilst the ranks, even of humanity itself, are yearly decreased to some slight extent, thanks to the fatal nature of the sting on certain constitutions. It is the duty, then, of everyone, I contend, to assist in the destruction of an insect which, so far as I have been able to discover, performs no good function in life, and is hatched only to annoy (!). A series of experiments with various kinds of exterminators, has proved to me that nothing is so effective as a chemical compound called "Death to Wasps," and for which I have looked through your advertisement columns in vain. Its effect is instantaneous and painless, as I have found after a trial of four or five years, and I am merely writing *pro bono publico* in thus bringing it to the notice of your many readers. I may add that every queen wasp observed in the spring or early summer should be destroyed at all risks. *Vespa*, P.S.—Since penning the above, I have had my attention called to the death of an unfortunate lady in Devonshire through a wasp becoming entangled in her hair. A sad end to an accomplished woman. *V.*

CONFERENCE ON BEGONIAS AND APRICOTS.—I regret that I was prevented from being present at the recent Conference on Begonias and Apricots at Chiswick. The rise and progress of our present race of tuberous-rooted Begonias and their possibilities in the near future form a most interesting chapter in the history of horticulture of recent years. Had I been present, I should have deprecated the enlargement of the flowers in the future, but would afford welcome to greater variety in form and colour and in hardness. The introduction of variety in the way indicated would be better than the reducing all to one uniform circular outline, and creating flowers, which might (so far as form is concerned), be Hollyhocks, or double Balsams or Camellias, rather than Begonias (*Gard. Chron.*, p. 244). Had I been at the Apricot Conference I should have liked to ask the French reader of the paper as to the general lack of flavour of French Apricots and those grown on the Continent generally. The list of sorts grown in France will doubtless be published in full in the *Journal of the Royal Horticultural Society*. It is probable that the generally inferior flavour of French Apricots is due to the practice of raising them from seed, to climate, culture, or other causes. Generally, too, French Apricots are smaller, paler, as well as more insipid than English ones, seldom larger or so large as the Kaisha—without a trace of its nice flavour. It is to be hoped that M. Jamin's views were very clearly ascertained as to the loss of the branches of Apricots in France. Very diverse views have been circulated on this matter, some asserting that by the use of the seedling trees this provoking malady is quite overcome. The effect of frost as a producing cause of ulcer or canker in Apricots has probably been exaggerated, seeing that the trees in the coldest countries are not the worst sufferers from these maladies. It is less prevalent in Scotland and in the northern counties of England than in the east or south. It seems also amenable to root-pruning, lifting the roots, and liberal culture. I see in to-day's paper that Mr. G. Wythes made a fine show of Apricots at Earl's Court the other day, carrying off all the leading prizes. I had the pleasure of seeing his trees recently, the finest high wall of Apricots without spot or flaw either in leaf, branch, or fruit that I have seen for many a year. It is hoped that the papers of Messrs. Rivers of Sawbridge-worth, and Mr. Smith of Mentmore, on Plums will soon be published in full. There is more money in Plums than in any other English hardy fruit at the present, and no greater services can be rendered to growers and the general public, than trustworthy instructions by experts. In spite of the comparative failure of the Plum this year, planting is likely to be carried on extensively in November, and instructions as to what and how to plant will be of much value. *D. T. F.*

SCIAOPIYTS VERTICILLATA.—Having noticed the remark by "H." in his interesting paragraph on this Conifer (*Gardeners' Chronicle*, Sept. 3, p. 271), that this tree is of a slow-growing nature, I think it may be worth while to mention that there is a specimen in the Cambridge Botanic Garden, growing at the rate of not less than 1 foot in height each year; it is now 8 feet 10 inches high. It is planted in peaty soil, in a low sheltered part of the garden,

where there is a good deal of moisture. The low temperatures of the last two winters have done it no injury whatever. *R. Irwin Lynch.*

—We have in the gardens of which I have charge, two plants of this species of Conifer, which have been in the place twelve years, and I cannot say they have not increased in size since they were planted, but it is very little. It is one of the few trees which I must admit I have not been able to grow, no matter how I try; fresh sites and soils have all had a turn, whilst the results are the same. The best Orchid peat, mixed with leaf soil, was last tried, but the effect of this addition to the staple is the same. Of water of different kinds the plant has had enough. After what "H." p. 271, says of it, I feel inclined to take fresh heart, and give it another trial. *E. M.*

PAULOWNIA IMPERIALIS (see p. 250).—Last year I again raised this from seed supplied by Mr. Child, of Floral Park, New York. I had three seedlings. One, before it was a year old, I planted out in a field (in a sheltered spot for the Cotswolds). It died down from frost, but it has sprung up from the roots, and is now over 1 foot high, and healthy. No. 2 survived the winter in a perfectly cold house. This I have given away to be planted out. No. 3 also survived in a cold house, won 3rd prize as a specimen plant at our show, and is now planted out to harden for the winter. I planted it deeply, i.e., above the commencement of this year's growth. It still stands 3 feet 2 inches above the ground, and the leaves are more than 1 foot each way. It has not flowered yet. I have also raised from Child's seed the *Ailanthus glandulosa* (Chinese Tree of Heaven). This also, if cut down by frost, will spring from the roots. But mine survived last winter in the field. *A. P. Bower.*

—Close to where I am writing, there is growing a handsome specimen of this tree, fully 20 feet high, and 40 feet in the spread of its branches. It flowers freely every year. The frosts of the last two winters, although they were the most severe ones that I have experienced in South Hampshire, do not appear to have injured this tree. The Paulownia is a tree which requires, for full development, ample space, as the growth is more inclined to extend laterally than to ascend. As a lawn tree it is unequalled. *E. Molyneux.*

SALVIA HORMINUM AND INSECTS.—The question raised on page 279, "How do flowers attract insects," reminds me of this little-known annual; which, although rather ornamental, and cultivated in English gardens in the time of Gerard, is seldom seen. The plant, having shabby inconspicuous flowers, hidden in the axils of the leaves, and not being satisfied with them, has provided itself with showy tufts of leaves, probably to attract insects at the top of each stalk, which are either purple, pink, or white, varying in different individuals with the colour of the flowers. It might be interesting to grow the colours separately, and watch whether they are visited by the same insects equally. The plant is of the Sage or Clary tribe, and is common in south-eastern Europe. *C. Wolley Dod, Edge Hall.*

PRUNUS PISSARDI.—The *Prunus Pissardi* is, we believe, the earliest tree to flower, and one of the very last to lose its leaves. It is budded or grafted on the Myrobolan, or the Brompton or Plum Stocks. Myrobolan has green leaves and thorns. It is a plant that is now being largely grown by nurserymen as a foliage tree, and very handsome its dark purple leaves are; but we believe it seldom fruits in this country. *Shuttleworth & Co., Limited, Fleet, Hants, and Peckham, S.E.*

SEEDLING TUBEROUS BEGONIAS.—I send for your inspection a few flowers of Seedling Double tuberous Begonias taken from plants growing in the borders. These plants were noticed by M. Goldring in the pages of the *Gardeners' Chronicle* the week before last. The plants are all from seed sown last spring. You will notice what a stout petal and stalk the darkest flower has. The lighter-coloured and white varieties are not in the best form, they having suffered from the recent wind and rain more than the others. *F. Geeson.* [The flowers are of extraordinary size, and good quality. *Ed.*]

LETTUCE-GROWING BY ELECTRICITY.—If your correspondent, who signs himself "Non-believer," had dubbed himself "Non-arithmetician," he would have given a correct appellation. The figures given by him in his reference to electrical Lettuce culture, seemed to me so incorrect that I ventured to work them out for my amusement, and here is the result.

The Lettuce-house in question is given at an area of about one-third of an acre; we will, as your correspondent has done, take it at an exact one-third. Now, the superficial area of an acre is 4840 square yards, one-third that area being 1613 $\frac{1}{3}$. How "Non-believer" makes it to be only 1493 $\frac{1}{2}$ square yards, I do not know. Then the further developed area of this third-of-an-acre is 14,517 square feet, and this number multiplied by 144 gives a total of 2,090,448 square inches. Now, the number of plants taken off the area from one cropping is 24,000, and the above number of inches divided by this lesser number, instead of giving to each plant an area of only 8 $\frac{1}{2}$ square inches, which is hardly 3 inches square, really gives to each plant a trifle over 87 inches, or an area of 9 $\frac{1}{2}$ inches by 9 inches—such a diverse result, that it is singular that anyone should have fallen into such an arithmetical error. I admit it would be difficult in the open ground to grow our best Cos Lettuces in even an area of 87 square inches, but, under glass, and with a crop literally forced into very rapid maturation, it is quite possible, and we can very well imagine that every leaf would be tender, and even delicious eating. Why the ground should be ploughed, it is hard to understand, as half-a-dozen sturdy labourers should do it in a day. *A. D.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 6.—The meeting held in the Drill Hall, James Street, Westminster, was of much interest to lovers of Orchids, Gladioli, hardy perennials, and fruit, the display being an especially fine one with regard to the first two named. The hardy kinds of fruits were clear in the skin, and of fair development for this period of the autumn. The display of a numerous collection of varieties of Runner Beans of a very diverse character, afforded a valuable object-lesson to market and private growers, who were, alas! but few in number.

Floral Committee.

Present: W. Marshall, Esq., chairman; Messrs. B. Wynne, H. Herbst, D. P. Laird, R. Dean, C. T. Druery, G. Phippen, H. B. May, G. Gordon, N. Davis, C. J. Salter, C. E. Pearson, J. Bennett-Poe, W. Goldring, J. Fraser, and W. H. Williams.

Messrs. Kelway, of Lanport, Somerset, exhibited a fine collection of Gladioli spikes, reaching almost from end to end of the Hall, though scarcely so good as in other seasons. Many of the varieties arrested attention, and Awards of Merit were granted for Numa, a good and large flower, the ground of which is white, flaked with rose, and the bottom petals slightly sulphured. Also for Poetis, a pretty flush-white variety, slightly marked with yellow and rose (Silver Flora Medal).

Messrs. J. Veitch & Sons, Chelsea, exhibited a plant of *Ketiospora squarrosa* sulphurea, in habit exactly similar to the type, but with a sulphur instead of the glaucous tinge. Also sprays of *Clerodendron trichotomum*, and of *Bignonia grandiflora*.

A stand of seedling varieties of Cactus Dahlias, of considerable merit, came from Messrs. Keynes, Williams, & Co., The Nurseries, Salisbury. Awards of Merit were granted to the following: Bertha Mawley, scarlet, good; Mrs. Bashan, pink, falling to a bronze in the centre; Countess of Radnor, pink, with a tinge of yellow; and Kaiserin, a very pretty yellow.

Messrs. Wm. Cutbush & Co., Highgate, contributed a collection of cut herbaceous flowers, including *Statice latifolia*, *Tradescantia virginica rubra*, *Coreopsis lanceolata*, *Harpalum rigidum*, varieties of *Helianthus* and *Gladioli*, and a number of blooms of Hollyhocks, &c. (Bronze Banksian Medal).

Messrs. Cannell & Sons, Swanley, had blooms of their double Begonias, Rosebud (pink) and Octavie, a very good white Camellia-like bloom.

From the Royal Horticultural Society's Gardens, Chiswick, came a collection of varieties of *Helianthus* and *Rudbeckia*; also some sprays of *Fuchsia fulgens*.

Messrs. Pitcher & Manda, Hextable, Swanley, Kent, sent a collection of cut herbaceous flowers, in which we noticed the following:—*Clematis Davidiana*, *Eupatorium perfoliatum*, *Poterium canadense*, *Monarda didyma*, *Lilium Batemanne*, *auratum*, and *L. a. macranthum*, *Asclepias incarnata pulchra*, &c. (Silver Banksian Medal).

Messrs. Hugh Low & Co., Clapton, contributed a handsome group of *Lilium Wallichianum superbum* in full bloom (Silver Banksian Medal).

A very good double Marigold, named Prince of Orange (large scarlet), came from Messrs. J. R. Pearson & Sons, of the Chilwell Nurseries, near Nottingham.

A very fine Canna, called Star of '91, a rich scarlet, came from Mr. C. L. Allen, Floral Park, New York, and was granted an Award of Merit.

Mr. Richard Dean, Ranelagh Road, Ealing, sent a collection of hardy flowers, of great merit, including Asters, Zinnias, Anemones, &c. Bronze Banksian Medals.

Some new single Dahlias and seedling Ploxes came from Mr. Jno. Farquharson, Wrexham.

A seedling Tacsonia, named Smythiana, came from Mr. Smythe, gr. at Basing Park, Alton, Hants. The interior of the flowers are brilliant scarlet, and the tips of the calyx segments yellowish-green; the leaves are dark green, and glabrous.

Mr. T. B. Haywood, Woodhatch Lodge, Reigate, showed *Passiflora* ×, a result of crossing *P. racemosa* and *P. quadrangularis*. The flowers are pleasing in form, but the colours are rather dull. It was figured in these pages December 22, 1888.

Orchid Committee.

Present: Dr. Maxwell T. Masters, F.R.S., in the chair; and James O'Brien (Sec.), F. Sander, J. B. Haywood, Rev. E. Handley, E. Hill, H. M. Pollett, W. H. White, Chas. Pilcher, and H. Ballantine.

There was an extraordinarily fine show of Orchids, to which Messrs. F. Sander & Co. of St. Albans contributed the best group. Among their most noteworthy specimens were a new *Cattleya* of the *C. lutescens* class, and probably a natural hybrid. It was named *Cattleya Oweniana*. The flowers were equal in size to those of *C. Hardyana*, to which the rich dark crimson, gold-veined labellum bore much resemblance. The sepals and petals were cream-white, with a faint purple tinge at the tips (First-class Certificate). Messrs. Sanders' group also contained eight large specimens of *Vanda Sanderiana*, bearing together 124 blooms, one of the best, a grand variety, having six spikes; several good *V. corulea*, *V. Kimballiana*, *Lycaste Skinneri alba*, a batch of the pretty *Dendrobium bigibbum*, several *Cattleya Warscewiczii Sanderiana*, and good representatives of the other *Cattleyas* of the season; several *Dendrobium Phalenopsis Schroderiana*, three of the beautiful *Cypripedium Chamberlainianum*, *C. Youngianum* ×, *C. picturatum* ×, *C. Macfarlanei* ×, *C. radiosum* ×, *C. polystigmaticum* ×, and the new hybrid *C. Mrs. G. D. Owen* × (*superciliare* × *villosum*), a massive variety, of good shape; *Odontoglossum Pescatorei*, *Roebili*'s variety, a fine white, with the labellum heavily marked with purple; *Cycnoches chlorochilon*, *Catasetum purum*, &c. (Silver-gilt Medal). Next in importance was a group of *Dendrobiums* from W. B. Farnham, Esq., Quorndon House, Loughborough (gr., Mr. Cooke). There were thirty-six plants of *Dendrobium Phalenopsis Schroderianum*, in every shade of colour to be found in the species, and exhibiting good culture, as also did the batch of well-bloomed *Dendrobium formosum giganteum*, set up with them, and the whole were tastefully arranged (Silver Flora Medal). From the gardens of Sir Trevor Lawrence, Bart., Barford Lodge, Dorking (gr., Mr. W. H. White), came a large basket of sturdy plants of the bright vermilion-coloured *Habenaria militaris*, which is cultivated there with so much success, and for which a Cultural Commendation was awarded; also a finely-flowered specimen of *Miltonia spectabilis Moreliana*.

W. R. Lee, Esq., Beech Lawn, Audenshaw, near Manchester, sent *Cattleya speciosissima* var. *Sanderiana*, one of the handsomest and purest of white *Cattleyas*. Its single large flower bore but a faint lemon-yellow tinge in the throat. It is a very fine and distinct *Cattleya* (First-class certificate).

Messrs. J. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, exhibited another of their remarkable hybrid Orchids in *Sophr-Cattleya Veitchii* × (*Laelio-Cattleya elegans* (Schilleriana) ♂, *Sophranitis grandiflora* ♀). The flowers equal in size those of *Sophr-Cattleya Batemaniana* ×, and are borne on a plant only 3 or 4 inches in height; the sepals and petals are of a clear rosy-red, with an orange or scarlet tinge, the veining being of a darker hue. The lip is yellow at the base, with crimson veining, which deepens in tint as it reaches the front lobe (First-class Certificate). They also exhibited their pretty *Laelio-Cattleya Proserpiae* × (*C. velutina* ♂, *L. pumila Dayana* ♀), and *Cypripedium H. Ballantine* × (*Fairrieanum* ♂, *purpuratum* ♀), both of which had previously received awards.

Thos. Statter, Esq., Stand Hall, Whitefield, near

Manchester (gr., Mr. Johnson) showed a grand spike of *Laelia elegans superbissima*, one of the finest forms of the *Turneri* section yet seen. The labellum had a very broad and large middle lobe, both it and the tips of the side lobes being of a glowing purplish-crimson (Award of Merit). Mr. Statter also sent cut spikes of *Cattleya Amesiana* ×, and of a light unspotted form of *C. granulosa*, closely approaching *C. Dubuyssoniana*.

Messrs. Linden, l'Orticulature Internationale, Park Leopold Brussels, exhibited *Acrides Augustianum*, a distinct form with pale pink flowers (Award of Merit), three good varieties of *Cattleya Acklandia*, and cut flowers of forms of *Cattleya guttata Leopoldii* (Vote of Thanks).

Messrs. Pitcher and Manda, The United States Nurseries, Hextable, Swanley, Kent, staged an effective group composed chiefly of rare *Cypripediums*, for which the firm is noted, over which came the graceful sprays of *Oncidium incurvum*. *Cattleya maxima* and *Oncidium papilio* also were in the group (Silver Banksian Medal).

From McArthur's Nursery, Maida Vale, London, W, came a small selection of well-flowered Orchids, in which the *Cattleyas* and *Cypripediums* were good; and Messrs. Hugh Low & Co., The Nurseries, Clapton, E., exhibited plants of *Vanda Kimballiana* and *Cypripedium Parishii*.

Rev. E. Handley, Royal Crescent, Bath (gr., Mr. Kerslake), showed two remarkably well-grown *Dendrobiums*, viz., *D. Phalenopsis Statterianum*, with six spikes, and *D. P. Schroderianum*, with a noble spray of twenty-three flowers (Cultural Commendation for both).

From Baron Schroder's gardens, the Dell, Egham (gr., Mr. H. Ballantine), came a fine spike of the beautiful Veitchian hybrid *Phajus maculato-grandifolius* ×, which proves to be one of the finest yellow Orchids we have.

Stanley G. Lutwyche, Esq., Oakfield, Eden Park, Beckenham, sent a large healthy specimen of *Peristeria elata*, with one spike.

Drewett O. Drewett, Esq., Riding Mill-on-Tyne (gr., Mr. A. J. Keeling), sent cut flowers of *Masdevallias*, which arrived too much withered to be considered fair specimens; and John Larking, Esq., Delrow, near Watford, sent, for the opinion of the Committee, a hybrid *Cypripedium*, which was determined to be *C. T. B. Haywood* × (*Druryii* × *Spicerianum*).

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; Dr. Hogg, Messrs. W. H. Divers, G. Norman, H. Balderson, J. Hudson, G. H. Sage, G. Reynolds, W. Bates, A. Dean, J. Wright, W. Warren, G. Taber, J. Cheal, T. J. Saltmarsh, G. Bunyard, H. Pearson, H. Weir, T. Francis Rivers, and G. T. Miles.

A very good collection of fruit was to be seen, owing to the exhibits of Messrs. Veitch, and Messrs. Bunyard and Co., of Maidstone. Messrs. Jas. Veitch & Co. had some eighty dishes of autumnal fruit, all of which had been grown in the open, many of the samples being so fine as to suggest orchard-house cultivation. Of Apples, perhaps the best were Emperor Alexander, Worcester Pearmain, Kerry Pippin, Potts' Seedling, Seaton House, Warner's King, Frogmore Prolific, Stirling Castle, Lady Sudeley, Early Strawberry, and Benoni. Amongst thirty dishes of Plums, were very fine Kirke's, Prince Engelbert, Frogmore Orleans, Belle de Louvaine, Large Black Imperial, Michelson, Angelina, Duke of Edinburgh, Victoria, Pond's Seedling, Late Transparent Gage, Bryanston's Gage, Lawson's Golden Gage, Jefferson's Yellow, White Magnum Bonum, &c. There were also Damsons, Figs, Pears, Gooseberries, and four dishes of ornamental Crabs, the best of which was Jno. Downie, an exceedingly decorative variety, and quite eatable (Silver-gilt Knightian).

Messrs. Geo. Bunyard & Co., had a collection embracing twelve large baskets and seventy-nine dishes of very fine quality. There were good fruits of Apple Lady Sudeley, Duchess of Oldenburgh, Potts' Seedling, Emperor Alexander, Peasgood's Nonsuch, Stirling Castle, Worcester Pearmain, Red Astrachan, Warner's King, New Hawthornden, &c.

Of Pears, there were Louise Bonne of Jersey, Pitmaston Duchess, Dr. Jules Guyot, Petite Marguerite, Madame Treve, and Doyenné Boussoch; Peaches, Nectarines and Gladstone; also some Damsons, and a few dishes of ornamental Crabs (Silver Gilt Knightian Medal).

Some excellent Peaches and Nectarines came from Mr. W. H. Divers, gr. to J. T. Hopwood, Esq., Ketton Hall, Stamford, including Peaches, Princess of Wales, Sea Eagle, Bellegarde, Violette Hatve,

Crimson Galande, Lord Palmerston, Barrington, Diamond, and A bec; Nectarines, River's Orange, Spenser, Pine-apple, River's Large Elruge, Lord Napier, and Dryden. All of the samples were of excellent quality, and we doubt if there were any better at the great fruit show at Earl's Court (Silver Knightian Medal).

Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, exhibited a very fine collection of fruit (hardy and orchard-house, including Figs Bourjasotte Grise (very fine), White Marseilles and Black Ischia; Nectarines, Large Elruge, Pine-apple, River's Early Orange, and Humboldt; Peaches, Noblesse, Grosse Mignonne (very fine, from orchard-houses) Royal George, &c. Also some Apples, and four Melons, including two very pretty fruits of Ruxley Favourite, and A. F. Barron (Silver Knightian Medal).

Mr. W. Wright, gr. to J. Buchnall, Esq., Langley Court, Beckenham, staged a dozen fine and well-coloured fruits of Sea Eagle Peach. Messrs. J. Cheal & Sons, Crawley, a collection of ornamental Crabs (Vote of Thanks).

From the Duke of Northumberland, Syon House (gr., Mr. G. Wythes), came a new Pea, called Veitch's Success, which received a First-class Certificate. Also a dish of very fine Pond's Seedling Plums (Vote of Thanks). Mr. Weir, The Gardens, Acton Park, Wrexham, exhibited a new Grape (black), called Weir's Cape Muscat, the flavour of which was very good.

A brace of seedling Melons came from Mr. W. Palmer, Conder Villa, Junction Road, Andover; and a half-dozen large red Tomatos (Ponderosa) from Mr. R. Owen, Floral Nursery, Castle Hill, Maidenhead. Mrs. Cooper, Lewes Road Nursery, Brighton, sent a dish of culinary Apples, named Mr. Cooper; and another dish of Apples came from Mr. J. Bowerman, Hackwood Park Gardens, Basingstoke, called Owen's Seedling.

Mr. R. Dean, Ealing, showed a good dish of Tomatos (Conference), and Apples (Lord Grosvenor), very fine. Mr. E. Burnard, Woodcote Road, Wellington, had a small red Tomato called Sabine's Choice.

From the Royal Horticultural Society's Gardens, Chiswick, came a collection of Runner Beans, including about forty-six varieties. There were excellent examples of the ordinary green Runners in great variety, of some of the best French varieties, and of the blue-podded, white-podded, and a very pretty variety called Speckled Butter, the pods of which are flaked with rose. Besides these, were some Butter Beans from Hungary, not very appetising to look at, perhaps, to those accustomed to green Beans; these were excellent examples of culture. Butter Beans are great favourites on the Continent, served in some simple kind of sauce, and when once tasted, they are generally liked. Some are stringless—at least, while young—and they are usually broken across when prepared for cooking; hence the name "snap," which some of them bear.

LECTURE ON ROOT-PRUNING.

In the afternoon, Mr. George Bunyard, of the Maidstone Nurseries, gave a lecture on the above subject, the chair being occupied by Mr. Geo. Gordon. The lecturer in commencing said that, if cultivators wished to maintain a proper balance between the different parts of a tree, attention would have to be paid to the roots, and went on to explain how it was, and in what circumstances root-pruning became a necessity. The difference between the fibrous surface-roots and the thick tap-like roots was explained, and the usefulness of the former in securing good fruitful wood pointed out, which was illustrated by young Apple trees on the Paradise and Free stock. The use of each stock was dwelt upon, hints given as to pruning of the Free stock, so as to ensure as many fibrous surface roots as possible. Mr. Bunyard said, that large pyramidal trees were those most generally neglected in gardens, and gave instructions how to proceed in the matter when it was wished to renovate specimens that had been neglected for a long time, emphasising the importance of careful procedure, and of not attempting more than one-half the tree in the same season, lest the check be too much for the tree to recover itself. After having cut off a large tap-root, it was advised that a slate, or other suitable material, should be placed under the cut so as to force the new roots that would be emitted to assume a horizontal position when starting. A pair of Vine-loppers like those used in the Continental vineyards was shown, as being the best instrument for cutting of the tap-roots, and as the shears cut both ways, a very clean cut is secured. Mr. Bunyard reminded his hearers that fruit trees

liked a close bard soil, and advised that vegetables should never be planted nearer to a wall where fruit trees are planted than 3 feet, remarking that it was when the roots got into the soft, deeply worked, and richly manured soil of the garden, that thick green growths were made, that were of no use to the fruit-growers. Peaches, Nectarines, and Apricots in houses would sometimes require root-pruning, and this operation could be done in wet weather in the autumn after the fruit has been gathered, but before the leaves have fallen. When a tree has been subjected to severe pruning, the lecturer said he would not mulch until the following spring. In concluding, Mr. Bunyard pointed out that a proper and judicious system of root-pruning induced fertility, improved the flavour of the fruit, prevented the formation of useless shoots, minimised the necessity of winter pruning, and prevented canker.

Mr. Alex. Dean, in proposing a vote of thanks to the lecturer, referred to the advisability of cutting roots in such a manner that the cut rested on the soil instead of looking towards the operator. Such a method would tend to induce the roots to assume a horizontal position. Mr. Dean then made a few remarks upon the system of root-pruning, and thought that nurserymen and gardeners were to blame for the necessity of such an unnatural treatment—the nurseryman for raising his trees in such rich land, and the gardener for planting the trees in land of the same nature. The chairman instanced a case in which root-pruning had been carried out on less careful methods than Mr. Bunyard had advised, and when the check had been such that trees operated upon some seven years ago had not yet recovered.

KINGSWOOD HORTICULTURAL.

AUGUST 24.—While Bristol city appears unable to maintain a horticultural Society, its great industrial suburb, Kingswood, does so with marked success, and its second exhibition, held on the above date in the grounds of Mrs. Stone, on Kingswood Hill, was highly successful. The weather was fine, and the neighbourhood was gay with flags and floral decorations. The exhibition was a great improvement upon that held last year, and the attendance very large.

Certain classes open to all brought a spirited competition. With twelve stove and greenhouse plants in flower, Mr. J. Cypher, Cheltenham, was 1st, being particularly strong in well-grown and flowered *Ericas* and other flowering plants; 2nd, Mr. J. F. Mould, nurseryman, Pewsey.

The only eight fine-foliaged plants came also from Mr. Cypher. Mr. G. Tucker had the best eight exotic Ferns. *Begonias* were very good. *Fuchsias*, zonal *Pelargoniums*, *Petunias*, &c., also. The best new and rare plant was *Dendrobium Phalenopsis Schroderi*, from Mr. Cypher; Mr. Mould taking the 2nd prize with a white form of *Erica Aitoniana* named *Lady Mary*.

Open class cut flowers were represented by some very fine *Roses* from Dr. S. P. Budd, of Bath, flowers remarkable for such fine quality so late in the season, H.P.'s and Tea-scented alike being in splendid condition. Messrs. Parker & Son, nurserymen, Bristol, also had some very good flowers. *Dahlias* were very good from Mr. G. Humphries, nurseryman, Chippenham; and from that well-known amateur, Mr. Hobbs, Lower Easton, Bristol. Flat-petalled and German *Asters* were excellent, especially the former, shown by Mr. G. Garraway, Bath. *Gladioli* and *Phlox Drummondii*, the latter in large and handsome bunches, were excellent features, the *Phloxes* so good indeed as to put the *Verbenas* quite in the shade. The best collection of stove and greenhouse cut flowers came from W. K. Wait, Esq., Bristol; Mr. G. Tucker, being a close 2nd. Stands of hardy cut flowers in twelve bunches were a leading feature, good subjects admirably staged; a bunch of *Tigridias* in this stand which gained the 1st prize for Mr. A. A. Walters, of Bath, was particularly novel and striking.

Fruit was sparingly shown. Vegetables were very good, especially the fine collection of eight dishes staged by Mr. G. Garraway, of Bath.

Plants shown by cottagers, a cottager being defined as a person whose rent does not exceed £13 per annum, were a surprise. The growers of these are mainly shoemakers, all of them having a small greenhouse or frame, and the plants shown included variegated well-coloured *Ananas*, *Caladiums*, *Palms*, *Ferns*, *Hoya carnosus*, *Vallota purpurea*, *Begonias*, zonal *Pelargoniums*, *Fuchsias*, and many others. The cut flowers, hardy fruits, and vegetables were remarkable for good quality.

BIRMINGHAM FLOWER SHOW.

AUGUST 30, 31, AND SEPTEMBER 1.—An exhibition of *Dahlias* and other flowers, fruits, and vegetables was held in the Moseley Gardens. Good prizes were offered for collections of *Dahlias* (any kinds being allowed) to occupy a space of not less than 12 feet by 3 feet wide, and seven competitors entered, with stands that occupied from 15 to 20 feet in length. A long bank of these flowers was staged, and a most effective display was made, chiefly in neatly set-up bunches of *Cactus*, singles and *Pompons* especially, nicely arranged, with stands of prize flowers in the foreground. Messrs. Perkins & Sons, Coventry, were 1st, with a very fine display, in which bouquets of *Dahlias* were introduced; 2nd, Messrs. Jones & Son, Shrewsbury; 3rd, Messrs. Kimberley & Sons, Coventry. The classes for thirty-six and twenty-four *Dahlias* were well filled. Messrs. Heath & Son, Cheltenham, 1st; Messrs. Kimberley & Son, Coventry, 2nd, in both classes. For twenty-four bunches of hardy border flowers, dissimilar, Mr. W. B. Child, florist, Acocks Green, was 1st; Messrs. Harkness & Sons, Bedale, 2nd.

Good prizes for fruit brought out some fine exhibits. For collection of eight varieties, Mr. Dawes, gr. to H. M. Biddulph, Esq., M.P., was 1st, with a fine display; 2nd, Mr. T. Roberts, gr. to H. W. Foley, Esq., Prestwood, Stourbridge, with a good lot; 3rd, W. Gilman, Ingestre Hall Gardens.

Fruit.—For three bunches Black Hamburgh Grapes, Mr. Bannerman was 1st, as he also was for three bunches Muscat of Alexandria, and three of any variety of black Grapes but *Hamburghs*. Mr. Stainton, Stoneleigh Village, staged two dozen very large *Williams' Bon Chrétien Pears*; and Messrs. Bunyard & Son, Maidstone, Kent, a grand display of fifty-six dishes of Apples and Pears, and eight baskets of Apples. Amongst the Apples were fine examples of leading sorts; and in Pears, *Souvenir du Congrès*, *Pitmaston Duchess*, *Benréd d'Amanlis*, and *Triomphe de Vienne*, were very fine.

Novelties, &c.—Messrs. Sutton & Sons, of Reading, sent a fine display of their new *Gloxinias*, to four of which First-class Certificates were awarded, viz., *Cyclops*, *Duke of York*, *Admiration*, and *Her Majesty*. Other fine sorts were staged, and choice annuals also.

Mr. Chas. Turner, Slough, sent new *Cactus* and *Pompon Dahlias*, and First-class Certificates were awarded to seedling *Cactus* varieties, *H. E. Milner*, *Blushing Bride*, *Joseph Chamberlain*, *Sir Hugo*, a fine scarlet; and to *Pompon*, *Little Lady*, cream, tipped with bright rosy-crimson.

Messrs. Perkins & Sons, Coventry, received a First-class Certificate for a very fine true *Cactus Dahlia*, *Matchless*, rich deep maroon-crimson, almost black.

Mr. Henry Eckford, Wem, contributed new Sweet Peas, and First-class Certificates were awarded to five of them, viz., *H. M. Stanley*, *Lady Beaconsfield*, *Venus*, *Lady Penzance*, *Ovid*, and *Royal Robe*. Specimens of his fine new culinary Pea, *Ambassador*, were also staged.

Amongst other honorary exhibits were a grand lot of thirty specimen double and single tuberous *Begonias*, sent by Mr. F. Jenkins, Olton, near Birmingham, large well-grown plants, admirably flowered, which closely covered a space 30 feet by 7 feet.

Messrs. Hewitt & Sons, The Nurseries, Solihull, staged 40 feet in length of cut herbaceous and other flowers, *Begonias*, *Carnations*, and other blooms and plants, a very fine display. Messrs. Thomson & Co., The Nurseries, Sparkhill, also had a fine display of cut flowers and plants, including fine new *Carnations* and *Picotees*, *Violas*, and other things. Messrs. Harkness & Co., Bedale, contributed a fine display of cut hardy flowers and border *Carnations*; Messrs. Pope & Sons, The Nurseries, King's Norton, a superb wreath and shower bouquet; Messrs. Shaw, of Kidderminster, and Jones & Sons, Shrewsbury, collections of *Gladioli*; and Mr. H. Whately, Kenilworth, a basket of very fine fruits of the new Tomato "*Ignotum*." Several other exhibits well demand notice also.

READING HORTICULTURAL.

AUGUST 31.—This annual late summer exhibition was held in the pretty Forbury Gardens adjoining the town, the plant, flower, and fruit exhibits being arranged as best they could in several small tents, dotted about amidst the flower-beds, whilst the superb collections of vegetables were staged in the open. Owing to the loss by a windstorm last year of the Society's large tent, which covered in the old show ground in the abbey ruins, the Society seems

to be in great difficulty. The show consequently suffered very much, because so cut up, and especially was this found to be objectionable when rain fell heavily during the afternoon, and drove visitors to shelter. Later the weather improved, and the attendance was so large that at times progress through the tents was again difficult. The plant classes owed much to the presence of some good specimens from Alderman Marriott's garden at Coventry, his gr., Mr. Finch, taking 1st place easily with six stove and greenhouse plants in bloom, having very good *Clerodendron Balfourianum*, *Stephanotis floribunda*, *Ixora Dudi*, *Ericas Marnockiana* and *Urania*, and *Dipladenia amabilis*; Mr. Mould, of Pewsey, was 2nd, with good plants.

The best six foliage plants came from the gardens of G. W. Palmer, Esq., M.P. (Mr. Dockerill, gr.); Mr. Mould again being 2nd. The finest flowering specimen *Ixora Dudi*, carrying several immense heads of bloom, came from Coventry. Mr. Finch also had the best specimen foliage plant in a very fine *Croton*. Mr. Finch also had the best six *Palms*; Mr. Turton, gr. to J. Hargreaves, Esq., Maiden Erleigh, being 2nd. A very fine half-dozen Ferns were staged by Mr. Dockerill, consisting of *Microlepia hirta cristata*, *Alsophila australis*, *Nephrolepis exaltata*, *Dicksonia antarctica*, and *Adiantum cuneatum*; Mr. Willis, gr. to W. J. Simmonds, Esq., Reading, was 2nd, having in his lot a huge *Davallia Mooreana*. Mr. Dockerill had the best six pans of *Lycopods* in beautiful fresh compact cones. Mr. Balchin, gr. to B. Simmonds, Esq., the largest six *Balsams*, but loose and over-potted. Mr. Bracey, of Tilehurst, had twelve superbly-headed dwarf *Cockscombs*. Six very fine bush *Coleuses*, richly coloured, came from Mr. Goodman, gr. to C. A. Tonge, Esq.; and Mr. Best, gr. to Mrs. Chute, the Vine, Basingstoke, had the 2nd lot in tall but thin pyramids.

Mr. Woolford, gr. to A. Palmer, Esq., was the only exhibitor of a large decorative group of plants, and was 1st for six zonal *Pelargoniums*, doubles unnamed. As might be expected, Tuberous *Begonias* were excellent, but only two lots of six plants were staged, Messrs. Dockerill and Woolford being the exhibitors. The former had the best pans of *Achimenes*, but these were not yet fully open. The smaller groups of plants were poor. Mr. Best was placed 1st with six table plants. Mr. Phippen, of Reading, set up a nice collection of plants, with some very handsome floral wreaths, crosses, &c., of cut flowers. *Dahlias* from Mr. Mortimer, Farnham, and Messrs. Cheal & Sons, Crawley, were excellent; these growers taking prizes in classes for eighteen and twelve blooms in this order. Messrs. Cheal made a beautiful exhibit of twelve bunches of single *Dahlias*; Mr. Such, Maidenhead, being 2nd. Messrs. Perkins & Sons, Coventry, showed beautiful *Roses*, including six blooms of Mrs. J. Laing, taking 1st place; they were also awarded a First-class Certificate for *Cactus Dahlia Matchless*, dark crimson. Mr. Finch showed splendid bunches of cut stove and greenhouse flowers. Mr. Best was 1st for *Asters*, and Mr. Turton for fine *Zinnias*. There were also *Gladioli* and other flowers shown, but being stood on the ground, somewhat escaped notice.

Fruit forms a striking feature always at Reading shows, the average quality being so good, in fact, relatively—so said an experienced fruit grower—as to have been equal to that of the recent show at Earl's Court. The best collection of eight dishes came from Heckfield Place, where Mr. Maxim, gr. to the Hon. Miss Lefevre is doing his best to keep up its old reputation for fruit. He had, in good condition, Mrs. Pince and Golden Queen Grapes, Sea Eagle Peaches, Lord Napier Nectarines, Washington Plums, Moor Park Apricots, &c. Mr. Goodman, gr. to Miss Hammersley, Bourne End, was 2nd; his dishes of fruits were excellent, but his Grapes rather weak.

In the class for six dishes, Mr. Smith, gr. to R. Overy, Esq., Badgemore, was 1st, having fine bunches of black *Alicante* and Muscat of Alexandria Grapes, with other fruit; Mr. Johnson, gr. to A. Gilliat, Esq., Slough, was 2nd.

With two bunches of black Hamburgh Grapes, Mr. Osman, gr., Ottershaw Park, was 1st, and Mr. Turton 2nd; both had very handsome samples.

With any other black Grape, Mr. Maxim was 1st, with good *Alicante*; Mr. Pound, gr. to Alfred Sutton, Esq., coming 2nd, with fine, well-finished clusters.

Mr. Smith was 1st with Muscat of Alexandria Grapes, not large, but well-finished; Mr. Pound coming 2nd, with fine bunches that were not quite ripe. These exhibitors took the same position with any other white, the former having very handsome Golden Queen, and the latter Buckland Sweetwater.

Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood

Park, had the finest dish of Peaches, with Barrington; and of Nectarines, with Humboldt.

Mr. Paxton, gr. to the Hon. C. S. Irby, Taplow, had the best Figs; and Mr. Waite, Glenburst, Esher, the best three dishes of Plums.

With five dishes of dessert Apples, Mr. Turton was well 1st, with rich-coloured Strawberry, Duchess Favourite, Worcester Pearmain, Kerry Pippin, Irish Peach, and Astrachan; Mr. Paxton coming 2nd.

In the class for six dishes of kitchen Apples, honours were divided, Mr. Turton and Mr. Dockerill being placed equal 1st. The former had fine examples of Saltmarsh's Queen, Lord Suffield, Warner's King, Peagood's Nonsuch, Waltham Abbey Seedling, and Ecklinville. Of other varieties the latter had very fine Bramley's Seedling, Emperor Alexander, and Stirling Castle.

Mr. Dockerill had the best flavoured Melons in two classes, in Hero of Lockinge, though over-ripe; and Mr. Mortimer the best brace of Cucumbers in Sutton's Matchless. The vegetables were wonderfully fine, and plentiful: Mr. Pope, gr. to the Earl of Carnarvon, Highclere Castle, was 1st with Messrs. Carter & Co.'s unlimited collection, having nineteen dishes; Mr. Lye, Sydmon Court, was 2nd, having seventeen dishes of fine quality; and Mr. Waite was 3rd, with twenty-four dishes. Messrs. Webb & Son's prizes for six varieties of vegetables were taken by Mr. Kneller, gr. to W. Portal, Esq., Malsbanger Park, Mr. Bowerman, Mr. Waite, and Mr. Pope respectively, the average quality being exceptionally good. For a similar class, Mr. C. Fidler's prizes, to which a Gold Medal was added to the 1st prize, Mr. Lye was 1st, with a superb lot; Mr. Kneller coming 2nd; Mr. Best, gr. to Mrs. Chute, The Vine, Basingstoke, 3rd.

Messrs. Sutton & Sons offered prizes in twelve classes for single dishes of vegetables, and brought a wonderful competition together of splendid products, all of which had to suffer from crowding on the tables and undue exposure to wind and rain. The chief prizetakers were Messrs. Lye, Kneller, Bowerman, Best, Waite, Turton, and Pope, who may be said to be a septet of high class vegetable growers, hard to beat anywhere. There were also large numbers of cottagers' exhibits in vegetables displayed.

EASTBOURNE HORTICULTURAL.

AUGUST 31.—The annual summer show was held on the above date in the grounds of Compton Place, and drew a large number of visitors. The leading features were stove and greenhouse plants, Ferns, and Fuchsias. The entries of fruits and vegetables for competition were fewer than usual, but a large space was occupied by fruits and by plants sent for show only, and were in themselves interesting to the visitors.

For eight stove and greenhouse plants, Mr. F. Portnell, gr. to Sir A. Lamb, Bart., Beaufort Park, Hastings, was easily 1st, with *Bougainvillea glabra*, *Allamanda Hendersoniana*, well-flowered; plants of *Dipladenia amabilis*, and *Ericas McNabiana* and *Everianum*; Mr. E. C. Gilbert, Springfield Nurseries, Hastings, was 2nd, his plants being good, but not so uniform as regarded size as Mr. Portnell's. The best were *Allamanda Hendersoniana*, *Lapageria alba*, *Statice imbricata*, *S. Gilbertii*, and some *Ericas*; Mr. A. Gadd, gr. to P. A. Eagles, Esq., Hollington, took the 3rd prize with half-specimens, the lot including a superb *Vallota purpurea* with numerous flowers.

In the class for six plants, Mr. Portnell was again 1st with well-bloomed plants of *Ericas*, *Statice*, and *Allamandas*; 2nd, Mr. A. Offer, gr. to J. Warren, Esq., Handeross Park, with nice fresh plants, amongst them a fine *Franciscea calycina major*, beautifully flowered; and the old and rarely exhibited *Clerodendron fragrans*; 3rd, Mr. Watson, Eastbourne.

In exotic Ferns, Mr. Offer was easily 1st with large well-grown specimens of tree and other species; 2nd, Mr. Gilbert, with smaller specimens, his best being a plant of *Microlepia birta*.

Mr. Watson, gr. to C. H. Simmons, Esq., was 1st for six Ferns, and Mr. Tugwell 2nd.

The class for foliage plants was one of the best, which is not a matter of surprise when such a well-known exhibitor as Mr. Offer brought some of his best plants, with which he easily secured the 1st prize; the group consisted of *Crotons* (beautifully coloured), fine *Cycas revoluta* and *C. circinalis*, and some large *Palms*. Mr. Gilbert, Hastings, was 2nd, with smaller plants.

Mr. Offer was again 1st with six, well grown—

Maranta Makoyana, *Dieffenbachia magnifica*, an *Alocasia*, and *Crotons*; 2nd, Mr. G. Watson, with larger plants, but not so well grown.

Mr. Portnell was 1st for six specimen *Ericas*.

The competition for groups of Ferns arranged for effect brought three nice groups, and Mr. Gilbert, who was 1st, had a base of *Adiantum*, with one large Tree Fern in the centre, a wooden stage being erected at the back, which did not add to the gracefulness of the arrangement, and with groups staged on turf little support of this kind is required; 2nd, Mr. Griffin, gr. to Mrs. Randall, Eastbourne, with a group in which were "dot plants" of choice species, and varieties of *Adiantum*.

Fuchsias were a telling class. 1st, Mr. Siggs; 2nd, Mr. Portnell, both lots being beautifully flowered.

Coleus of large size were well coloured, Messrs. Griffin and Holliday securing the chief prizes.

Balsams and *Petunias* were not well done; whereas *Begonias* were fine, Messrs. Holliday and Mills taking the prizes in the order of their names.

Pelargoniums were excellent, but there being only one class, the Ivy-leaved varieties—a fine lot of plants—scarcely got justice done them, Messrs. Holding and Griffin taking 1st and 2nd prizes.

Achimenes formed a noteworthy exhibit, being well grown. Fine pans of these plants were staged by Messrs. Holding, Watson, and Tugwell. There was but a limited competition for the best single specimen flowering plant; and for the collection of thirty-six varieties of cut *Roses*, Mr. Gorringer was 1st, Mr. Woolland 2nd. In the class for twenty-four *Roses*, 1st, Mr. Slaughter; 2nd, Mr. Brooks.

Fruit.—The quantity of fruit shown was not large. Culinary Apples were good, as were dessert Pears and Plums, and the prizes went to local exhibitors. For nine dishes, Mr. Blake was 1st, with good Grapes and Peaches. Mr. Holman, gr. to Viscount Gage, Lewes, was a close 2nd.

Melons were shown in quantity. Mr. Holman 1st, for flavour; 2nd, Mr. Gower. Many of the Melons shown lacked size.

Grapes, as a class, were poor. Messrs. Tugwell, Gadd, and Clapson were the successful exhibitors in the classes for black varieties; and Messrs. Clapson, Foxley and Tugwell in those for white ones. The cottagers' exhibits were not numerous, and Potatoes were the only items that were largely shown.

Wild flowers were well shown in trays, with their names attached, as were the flowers of annuals and herbaceous plants. There was a good exhibit of Grapes, Apples, Plums, and Tomatoes, from Mr. Larkin; of Dahlias, from Messrs. Cheal, Crawley; a large collection of herbaceous cut flowers, from Messrs. Cutbush, of Hightgate, N.; of decorative plants and wreaths, from Mr. Scott, Eastbourne; and fruit from Messrs. Knight & Dann, Hailsham, and from Mr. Goringe. For Messrs. Sutton's vegetable prizes, Mr. Holman was a good 1st, with a very even lot of produce; 2nd, Mr. Blake.

BISHOP'S STORTFORD HORTICULTURAL.

AUGUST 31.—This Society held its autumnal exhibition in the grounds of John Barker, Esq., J.P., The Grange, on the above date. This is one of the oldest-established Societies, having been in a flourishing state in 1813, but it seems to have lapsed until 1870, when it was revived, under the energetic management of the present Hon. Secretary, Wm. Smith, Esq., of The Links. The members of the Society have this year presented Mr. Smith with a very handsome gold watch and chain, to mark their appreciation of his valuable services to the Society for twenty-one years. The exhibition is a remarkably good one, not so much for the number of large specimen plants exhibited, but because of the general good quality of the exhibits from cottagers and amateurs. There were about 1300 entries altogether, and of course the gardeners of Essex were well to the fore in good culture, especially with vegetables.

Flowering stove and greenhouse plants were few, but foliage plants were represented by good specimens of *Crotons*, *Palms*, and *Alocasias*, the 1st prize for six going to the Misses Pulteney, Stanstead. The best exhibit of flowering plants was a collection of splendidly-grown double and single *Begonias*, from Wm. Smith, Esq., to which the 1st prize was awarded; two other good collections were shown. Groups of foliage and flowering plants were admirable; the best-arranged group, as well as the best-grown plants, were from Lord Rookwood, Down Hall, Hailson (gr., Mr. George Hersey). An admirable group of *Chrysanthemums*, principally Madame

Desgranges and George Wermig, came from Lieut.-Colonel Archer Houlton, Great Hallingbury (Mr. B. Calvert, gr.), which obtained a 1st prize. The Rev. J. Menet, Hockerill, easily obtained two 1st prizes with admirable blooms of Madame Desgranges and George Wermig, amongst ten competitors.

Table plants, always an admirable feature at flower shows, were well represented. The best half-dozen were sent from Lord Rookwood's garden.

Collections of single and double zonal *Pelargoniums* formed a good feature, and the best six in each class were sent by M. Taylor, Esq., The Wharf, Bishop's Stortford.

Cut flowers were not quite up to the average, but herbaceous plants, *Asters*, &c., were very good.

A good-sized tent was filled with table decorations, sprays, button-holes, and fruit. There were fourteen tables set out, some of them being very prettily arranged, all of them distinguished by lightness and good taste in arrangement. The 1st prize was awarded to Miss Gertrude A. Cass, Half-Acres, for an arrangement of long, rambling growths of *Ampelopsis Veitchii*, *Calioptis atro-sanguinea*, and the pale blue *Plumbago capensis*. The 2nd prize table from Mrs. Philip Rowne, Great Hallingbury, composed of *Plumbago capensis*, blue and white, with *Gypsophylla* and *Asparagus plumosus*, was also very elegant.

The best collection of fruit, also the best black and white Grapes, were from the garden of Lieut.-Col. Archer Houlton; the black Alicante Grapes were very fine indeed.

Collections of vegetables were in considerable force, and very good in quality. P. A. Taylor, Esq., Hadham Road, obtained the 1st prize, with a numerous and well-grown assortment. Walter Gilbey, Esq., Elsenham Hall (gr., Mr. Plester), obtained a 1st prize in another class. To give a list of all the well-grown vegetables, cut flowers, and fruit exhibited, would be tedious and uninteresting to general readers. The single epergnes, vases, &c., filled with flowers, from the ladies, filled up one side table in a long tent, the arrangement throughout being exceedingly tasteful. Messrs. Paul & Sous, of The Old Nurseries, Cheshunt, and Mr. W. Paul, of Waltham Cross, exhibited cut flowers.

Messrs. Rivers & Son, of the Nurseries, Sawbridgeworth, exhibited a fine lot of fruit trees in pots, and dishes of fruit.

Messrs. Venbury & Tarling, Sheering Nurseries, exhibited admirably-grown fruiting Vines in pots, for which they also received very high commendation. The rain fell heavily during the day, and sadly interfered with the enjoyment of the visitors.

NATIONAL DAHLIA.

SEPTEMBER 2, 3.—The drenching showers of last week told heavily against many of the Dahlia growers, and the sweeping winds which accompanied the storms seriously damaged many plants; bearing this kind of weather in mind, the exhibition of the National Dahlia Society at the Crystal Palace, was remarkably good. The entries were as numerous as ever, the competition was keen in most of the classes; the Cactus and decorative, the Pompon and single types were very good, and a substantial addition was made to the Cactus section by the addition of some novel varieties. Never before, perhaps, in the history of the Society was there such a scanty contribution of new show varieties, and not a single Certificate was awarded to any representative.

The first twelve classes were open to nurserymen, and in all those for show Dahlias, the fancy types were mixed with the self and edged flowers. It may be instructive to some to know that, according to the definitions set forth in the catalogue of one of the leading firms of Dahlia growers, a show Dahlia is a large self-coloured flower, or else the base colour is light, edged with a darker shade; in the latter case, the flower is termed "edged." A fancy Dahlia is similar in size and shape, but has two or more colours; either the ground colour of the florets is splashed or striped with other colours, or the florets have a dark base with a paler edge, in which case the flower is termed "tipped." The Cactus type follows the character of the species *Juanzei*. The decorative Dahlias are mainly small flat flowers of the show type.

Show and Fancy Dahlias.—In the class for sixty blooms, distinct, there were four entries, the 1st prize being awarded to Messrs. Keynes, Williams & Co., nurserymen, Salisbury, who had larger flowers than those shown by Mr. Chas. Turner, Royal Nursery, Slough, who had blooms a little less in size, but fresh, bright, and of higher quality, especially in

the matter of the centre. Messrs. Keynea & Co. had Harrison Weir, Mrs. Kendal, James O'Brien (Fancy), Shirley Hubberd, Duchess of Albany (F.), Colonel, J. N. Keynea, Richard Dean, Rebecca (F.), Rev. J. B. M. Camm (F.), J. Hickling, Buffalo Bill (F.), Gloire de Lyon, Arthur Ocock, William Rawlings, R. T. Rawlings, J. T. West, Imperial, Matthew Campbell (F.), Dandy (F.), Alice, Emily, T. S. Ware, Maud Fellowes, Willie Garratt, Duke of Fife, William Powell, another fine yellow; Mrs. Langtry, Mr. Stancomb, Comedian, a charming new Fancy; Miss Fox, and F. Pearce (F.). 2nd, Mr. Charles Turner. 3rd, Mr. Arthur Rawlings, nurseryman, Romford. 4th, Mrs. M. V. Seale, The Nursery, Sevenoaks.

There were four exhibitors of forty-eight varieties, and here Messrs. Keynea & Co. were 1st, with James O'Brien (F.), Mr. Glasscock, Colonel, Richard Dean, Duchess of Albany (F.), Mrs. Foreman, John Hickling, James Cocker, Rev. J. B. M. Camm (F.), William Powell, William Rawlings, Hon. Mrs. P. Wyndham, Thomas Hobbs, Buffalo Bill (F.), Mrs. J. Downie (F.), J. N. Keynea, J. C. Vaughan, Frank Pearce (F.), Comedian (F.), Crimson Globe, and Willie Garratt; 2nd, Mr. C. Turner; 3rd, Mr. A. Rawlings.

There were four competitors for thirty-six blooms. Here Messrs. Saltmarsh & Son, nurserymen, Chelmsford, were placed 1st, having fine blooms of Perfection, William Rawlings, Harrison Weir, Jupiter (F.), Henriette, Rev. J. Godday, Mand Fellowes, Hugh Austin (self), and Mrs. Saunders (F.); 2nd row: Shirley Hubberd, Henry Walton, John Walker, William Keith, Frank Pearce (F.), R. T. Rawlings, Mrs. D. Saunders, Willie Garratt, and J. T. West; front row: Mrs. Langtry, Crimson Globe, T. S. Ware, Lustrous, Lady G. Herbert, Mr. Harris, Matthew Campbell (F.), Lord Carlingford, and Mrs. Gladstone. 2nd, Mr. George Humphries, nurseryman, Chippenham, with a stand almost equal, though some thought superior, to the foregoing. 3rd, Mr. A. Rawlings. 4th, Mrs. M. V. Seale.

The same number of competitors showed twenty-four blooms, Mr. G. Humphries taking the 1st prize, with Harry Keith, Buffalo Bill (F.), William Powell, William Rawlings, Mrs. Gladstone, Purple Prince, and Henry Walton; second row: R. T. Rawlings, Colonel, Frank Pearce (F.), Duchess of Albany (F.), Salamander (F.), and Arthur Rawlings; front row: Volunteer, Victor, Henry Bond, and Mrs. J. Downie (F.). 2nd, Messrs. Saltmarsh & Son. 3rd, Mr. S. Mortimer, nurseryman, Faruham. 4th, Mr. J. Walker, Thame.

With twelve varieties, Messrs. J. Cheal & Sons, nurserymen, Crawley, were 1st, with Colonel, Crimson King, J. T. West, Lord Chelmsford, Matthew Campbell (F.), Mrs. Foreman, John Walker, Mrs. P. McKenzie, Mrs. Gladstone, Mrs. Langtry, Norah Creina, and Mrs. Jefford. 2nd, Mr. J. R. Tranter, nurseryman, Henley-on-Thames. 3rd, Mr. H. Harris, Writtle Road, Chelmsford.

Cactus and Decorative Dahlias.—In the class for eighteen varieties, two blooms of each, but two collections were staged, but they came very close together, Messrs. Cheal & Son gaining the 1st prize by a very few points. They had very good examples of Lancelot, similar in colour to Panthea, but a true Cactus type; Robert Maher, a good yellow; Josephine, new, maroon-crimson; St. Catherine, rich deep yellow, a true Cactus; Black Prince, large and somewhat coarse, but of a rich deep maroon colour; Lady Marsham, Charming Bride, Beauty of Arandel, Harry Freeman, a fine white; Juarez, Mrs. J. Douglas, Marchioness of Bute, Edith Cheal (new), brilliant maroon-crimson, very fine; Mrs. Hawkins, Duke of Clarence, Rayon d'Or, bright orange-red, with a band of white down the centre of each petal; and Honoria. 2nd, Mr. C. Turner.

There were four exhibitors of twelve varieties, six blooms in a bunch, Messrs. Keynea & Co. being placed 1st, with a collection which included several fine new varieties of exceptional merit, and of the true Cactus character, such as Countess of Pembroke, delicate lilac—very pretty; Countess of Radnor, yellow base, and deep reddish-salmon; Apollo, deep scarlet; Countess of Gosford, yellow, tinted with cinnamon and mauve; Bertha Mawley, orange-crimson, shaded and tinted with mauve; Mrs. Bashaw, mauve-pink and salmon; Kynerith, Duke of Clarence, Juarez, Amphion, Beauty of Brentwood, and Miss Violet Morgau, the basal petals tinted with delicate lilac-pink. 2nd, Messrs. J. Burrell & Co., Howe End Nurseries, Cambridge. Messrs. Paul & Son were 3rd, and Mrs. M. V. Seale 4th.

With twelve bunches of Cactus varieties only, Messrs. Keynea & Co., were placed 1st, with Duke of

Clarence, Kaiserin, pale yellow; Baron Schroder, St. Catherine, Apollo, Delicata, Kynerith, Daphne, orange salmon, suffused with mauve, very distinct and pretty; Wiltshire Lass, deep salmon, pale golden centre; Countess of Gosford, Bertha Mawley, and Countess of Radnor. 2nd, Messrs. J. Cheal & Son. 3rd, Mrs. M. V. Seale.

Pompon Dahlias.—These were as usual finely shown; out of four exhibitors, the best twenty-four varieties came from Mr. C. Turner, who had Marion, Lady Blanche, Isabel, Mabel, Fairy Tales, Dark-ness, H. F. Searle, Little Lady, Phoebe, Favourite, Golden Gem, Admiration, Mars, White Aster, Boule d'Or, Ringdove, Whisper, Cupid, E. F. Jungker, Ariel, Gipsy Queen, Amber, and two seedlings. 2nd, Messrs. Keynea & Co. 3rd, Messrs. J. Cheal & Son.

With twelve varieties, there were also four competitors, Mrs. M. V. Seale taking 1st prize with E. F. Jungker, Grace, Admiration, Red Indian, Favourite, Leila, Mabel, Dora, Phoebe, Whisper, Isabel, and Lillian, primrose, edged with peach, very pretty. 2nd, Mr. G. Humphries, with Lillian, W. Hiscock, dark maroon; Whisper, &c. 3rd, Messrs. J. Burrell & Co.

Single Dahlias.—There were three competitors with twenty-four varieties in bunches of twelve blooms, and very attractive they were. Messrs. J. Cheal & Sons were 1st with a superb lot, remarkable for freshness and moderate size. The varieties were Annie Hughes, clear yellow and peach, very pretty; Miss Roberts, the best yellow; White Queen, Lowfield Beauty, James Scobie, Mrs. Bowman, W. C. Harvey, Miss Linnaker Evelyn, delicate pinkish-mauve round a white ring; Lady Whitehead, rich rosy-purple; Duchess of Fife, Cleopatra, Miss Henshaw, Duke of York, bright orange-scarlet, very distinct and extra fine; Marion Hood, Amos Perry, Northern Star, Duchess of Albany, Formosa, Lady Helen, bright yellow tipped with white, very distinct; Mrs. W. C. Harvey, bright magenta, with edging of mauve; Victoria, Duchess of Anhalt, creamy-white, with broad margin of deep rose; and Little Snow-white, pure white. 2nd, Mrs. M. V. Seale. 3rd, Mr. E. F. Such, nurseryman, Maidenhead.

Twelve bunches, twelve blooms of each; there were but two competitors. Mr. G. Humphries was 1st, having Maude, white, with side margins of bright crimson-purple; Mr. Barker, Miss Ramsbottom, Northern Star, bright red, margined with deep golden yellow; Miss Roberts, Victoria, &c.; 2nd, Messrs. Paul & Son.

Amateurs: Show and Fancy Dahlias.—In the class for twenty-four blooms there were eight competitors, Mr. J. T. West, The Gardens, Cornwall, Brentwood, winning the Silver Cup given by the trustees of the Turner Memorial Fund, having fine blooms of R. T. Rawlings, Queen of the Belgians, Arthur Rawlings, J. T. West, William Rawlings, Mrs. Gladstone, and Duke of Fife in his back row; middle row: Glowworm, Mrs. Langtry, Shirley Hubberd, Mrs. D. Saunders, Lustrous, William Powell, Rev. J. Godday, and Mrs. J. Downie; front row: Prince of Denmark, Harrison Weir, Crimson Globe, Prince Bismarck, Frank Pearce, and Willie Garratt. 2nd, Mr. A. Ocock, gr. to Mrs. McIntosh, Havering, Romford, who had good blooms. 3rd, Mr. Thomas Hobbs, Lower Easton, Bristol.

For twelve show blooms only, Mr. S. Cooper, Chippenham, was 1st with Maude Fellowes, Gold-finder, Duchess of Albany (Self), Victor, Henry Bond, Harry Keith; 2nd, Mr. T. Vagg, gr. to J. Theobald, Esq., M.P., Romford; 3rd, Mr. G. Boothroyde, Red Hill, Havant. There were ten entries. There were seven competitors with six varieties; Mr. J. Couzens, Langley Burrell, Chippenham, being 1st with Colonel, J. T. West, Victor, Henry Walton, Mrs. Gladstone, and Picotee; 2nd, Mr. J. Gilbert, Freshwater, Isle of Wight.

Fancy Dahlias.—There were seven exhibitors of twelve blooms, Mr. S. Cooper was 1st with Rebecca, Mrs. J. Downie, Prince Henry, Salamander, Lottie Eckford, Mrs. Saunders, Duchess of Albany, John Cooper, Mandarin, Comedian, Dorothy, and Peacock; 2nd, Mr. J. T. West; 3rd, Mr. A. Ocock. There were ten competitors with six varieties, Mr. G. Boothroyde, was 1st with Matthew Campbell, Rev. J. B. M. Camm, Dorothy, Mrs. Saunders, Frank Pearce, and Comedian; Mr. T. Vagg was placed 2nd.

Cactus and Decorative Dahlias.—There were three competitors in the class for twelve bunches, six blooms in each, and Mr. J. T. West was 1st with Joseph Chamberlain, bright scarlet, rather paler than Juarez, Baron Schroder, Stebbing Wheeler, yellow, flaked with pale red; Black Prince, Kynerith, Mar-

chioness of Bute, Nellie Scupham, Mrs. Douglas, Mrs. Keith, Lancelot, and Seedlings. 2nd, Mr. James Strudwick, Silver Hill, Hastings. 3rd, Mr. W. Mist, Ightham, Sevenoaks.

There were eight competitors with six bunches, and Mr. W. Hopkins, Pilving, near Bristol, was 1st, with Duke of Clarence, Robert Maher, St. Catherine, Cannell's Favourite, Robert Cannell, and Delicata; 2nd, Mr. S. Cooper, with Mrs. Hawkins, Juarez, Baron Schroder, and H. Freeman, distinct from the foregoing.

Messrs. H. Cannell & Son offered special prizes for six varieties of Cactus and decorative Dahlias, sent out by themselves. There were two competitors, but one was disqualified for staging varieties not sent out from Swanley. Mr. C. Osman, Sutton, Surrey, who had Constance, Mr. J. Douglas, Juarez, Germania nova, Lady Marsham, Lord Lyndhurst, but badly set up.

Pompon Dahlias.—There were four exhibitors of six bunches of Pompon Dahlias, ten blooms in a bunch. Mr. J. T. West was 1st, with Tommy Keith, white and cerise-crimson; Sunshine, Mary Kirk, Eva, Little Sweetheart, and Gipsy. 2nd, Mr. J. Strudwick; 3rd, Mr. C. Osman. With six bunches, six blooms of each, Mr. S. Cooper was 1st, with E. F. Jungker, White Aster, Lorna Doone, Leila, Whisper, and Thisbe; 2nd, Mr. R. Burgood, Eynesbury, St. Neots.

Single Dahlias.—With six bunches, ten blooms of each, Mr. T. W. Girdlestone was 1st, with Annie Hughes, Jack, maroon-yellow satin; Kitty, Little Snow White, and Florence. 2nd, Mr. C. Osman, with six bunches.

Special prizes were offered by Messrs. J. Cheal & Son, for twelve varieties, six blooms of each, Mr. T. W. Girdlestone was 1st, with Marion Terry, Evelyn, Sunningdale White, Mikado, Bessie Hatton, Yellow Satin, Sunningdale Scarlet, Audrey, yellow, flaked with crimson; Fred Leslie, red, tipped with white; Dearest, white, with side margins of yellow, very pretty; Marion Hood, and Lila, white, with side margins of crimson. Mr. C. Osman was 2nd.

Open Classes: Show and Fancy Dahlias.—The best six blooms of any dark Dahlia were those of the Rev. J. Godday, from Mr. A. Ocock; Mr. Geo. Humphries was 2nd, with Arthur Rawlings; and Messrs. Saltmarsh & Son 3rd, with William Rawlings, Diadem, John Henshaw, Purple Prince, and James Cocker were also staged. The best light, not yellow, was white self, John Walker, shown by Mr. John Walker; Mr. G. Humphries was 2nd; and Mrs. Seale 3rd, with Mrs. Gladstone. Seven out of nine competitors staged the last-named variety. The best six blooms of yellow were those of R. T. Rawlings, from Mrs. Seale; Messrs. Saltmarsh & Son were 2nd, and Mr. J. T. West 3rd, with the same. The best tipped was Mrs. Saunders (Fancy); Mr. C. Turner was 2nd with the same. Mr. G. Humphries had Henry Walton, but this is an edged rather than a tipped flower. The best striped Dahlia was Mrs. J. Downie (F.); Mrs. Seale was 2nd with the same; Messrs. Saltmarsh & Son 3rd, with Frank Pearce. The best edged was Henry Walton, from Mr. S. Mortimer; Messrs. Saltmarsh & Son were 2nd; and Mr. A. Rawlings 3rd, with J. T. West.

Miscellaneous collections consisted of a large collection of cut Dahlias of all types from Mr. T. S. Ware, Tottenham; a collection of Chrysanthemums and other flowering plants backed by Palms from Messrs. Reid and Bornemann, nurserymen, Sydenham. Messrs. Pitcher & Manda, Hextable Nurseries, Swanley, had a large collection of cut flowers, including examples of two varieties of *Lilium auratum*, viz., *rubro-vittatum* and *amabile*; Messrs. Paul & Son, Old Nurseries, Cheshunt, hardy flowers, Dahlias, Roses, &c.; Messrs. J. Cheal & Sons, Crawley, a similar collection, Dahlias being largely represented; Mr. E. F. Such, nurseryman, Maidenhead, had hardy flowers and Dahlias; Messrs. J. Peed & Sons a large group on the floor and tables, also consisting of plants and cut flowers; and Messrs. H. Cannell & Sons, Swanley, a large and representative collection of Dahlias and other flowers.

Certificated flowers will be noticed next week.

ROYAL OXFORDSHIRE HORTICULTURAL.

The third of the exhibitions held by this Society took place in the quadrangle of Queen's College, the plants, cut flowers, and fruit being arranged in the covered colonnade, and the vegetables in the open. Plants are always limited in quantity, the

principal prize winners being Mr. J. Mattock, nurseryman; Colonel Meller, Shotover Park; Mr. G. Jacob, nurseryman; Mr. J. Johnson, J. Arnall, Esq., Mr. John Walker, &c. The *Gardeners' Magazine* Medal for special excellence was awarded to Mr. T. Anstiss, Brill, for a very fine example of *Vallota purpurea*, with over thirty trusses of bloom. Cut flowers consisted of Dahlias, Mr. John Walker, Thame, being a leading exhibitor; also Roses, well shown by Mr. J. Mattock; zonal Pelargoniums, very fine indeed; Gladiolus, hardy flowers, a very strong feature, &c. Fruit was good generally, and vegetables very fine. The Oxonian Runner Bean shown by the Provost of Worcester, is the finest of all the Scarlet Runner type, and was seen here in fine condition. Mr. J. R. Tranter, nurseryman, Henley-on-Thames, showed a self-coloured show Dahlia, named Gwendoline, claret-crimson in colour, a fine flower. An interesting collection of new selections of vegetables was shown by Mr. J. Jefferies, seedsman, Oxford.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 7, 8.—This society held its annual early autumn exhibition of Chrysanthemums and Dahlias on Wednesday and Thursday in the Royal Aquarium, Westminster. The number of Chrysanthemums at this early show is usually not great, and it is at least doubtful if there is any need of the large winter-flowering section in the month of September. However, we think that the show this week is quite up to the usual standard, and, indeed, in some instances, it may be said to have surpassed that of last year.

A great deal of interest had been aroused by the announcement that a collection of Chrysanthemum blooms that had been sent from New Zealand in the early part of this year, frozen in blocks of ice in a similar manner in which the frozen meat is preserved, would be exhibited at this autumn show, and interested groups of curious persons surrounded the blocks of ice during most of the time.

The collection consisted of eight blooms in the following varieties:—Tarawera, an incurved yellow; Zealand, incurved pink; Rimutaka, an incurved bloom that might perhaps have been bronze, but the colour was difficult to determine in this case; Tongarirua, a Japanese pink—this one had kept its colour better than any of them; J. J. Kerslake, an incurved yellow and Lady Bell. At the time we saw them, the appearances were such that we should think the size of the blooms was not quite equal to those we see in this country, and as they were perfectly surrounded in ice, it may be expected that we saw them through a magnifying medium. Mr. Jno. Earland, Wellington, N.Z., was the exhibitor, and he was awarded a Silver-gilt Medal.

The 1st class for Chrysanthemums was for a group consisting of any varieties, and the successful competitor was Mr. E. Wince, gr. to the London Cemetery Co., Highgate Cemetery, who staged a group of plants that reminded one strongly of November. A number of Japanese varieties, of good merit, were surrounded by dwarf plants of the summer-flowering kinds. Mr. Norman Davis, nurseryman, was 2nd, with a very similar lot.

For six plants, there appeared to be only one competitor, Mr. H. Neary, gr. to the Rev. R. W. Powell, Holy Innocents' Vicarage, Hornsey.

Mr. Robert Owen, Floral Nursery, Castle Hill, Maidenhead, was 1st for a collection of cut blooms, shown in bunches, who staged about eighty bunches. Most of the varieties were of the summer-flowering section, and we noticed that many of the best varieties were seedlings of 1891, and unnamed at present. Mr. E. F. Such, nurseryman, Maidenhead, with similar bunches, was 2nd; and Mr. W. Wells, Earlswood Nursery, Redhill, Surrey, was 3rd, with a collection of winter or autumn-flowering kinds, mostly Japanese.

For twelve blooms of Madame C. Desgranges, Mr. Turk, gr. to T. Boney, Esq., Cholmeley Lodge, Highgate, was 1st; and Mr. John Wright, gr. to the Hon. Society, Middle Temple, 2nd. Both exhibits were of good quality. Mr. Turk was again 1st for twelve blooms of any other kind, showing Mrs. Burrell.

For twelve Pompon Chrysanthemums the 1st prize was secured by Mr. H. Neary, with a very fine exhibit staged in bunches of threes. The best were Blushing Bride, Alice Butcher, Mrs. Davis, Mrs. Cullingford, Madame Lyon Tassal, and Madame Jolley-vart; 2nd, Miss C. Debenham; and 3rd, Mr. Norman Davis, nurseryman, Camberwell. Mr. Beech, gr. to L. Seligman, Esq., Hereford House, South Kensington, was 1st for six bunches of Madame

C. Desgranges; and Mr. Jno. Wright 2nd. Mr. Beech being again 1st for six bunches of any of the yellow varieties of Madame C. Desgranges. For six blooms of Madame Desgranges or of its sports, Mr. H. Wedekind, 13, Warlock Road, Paddington, secured a Bronze Medal.

Gladiolus.—Prizes were offered for a collection of Gladiolus spikes, and Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, was 1st, with about 120 spikes of good quality; W. Herbert Fowler, Esq., Claremont, Tunton, was 2nd, with a collection almost equally good.

For twelve spikes of distinct Gladiolus, the 1st prize went to E. B. Lindsell, Esq., Bearton, Hitchin, showing Pyramid, Mons. A. Brongniart, Le Vesuve, Bicolor, Atlas, Baroness Burdett-Coutts, Delila, Hesperides, Horace Vernet, African, Grand Rouge, and Crêpuscule. W. Herbert Fowler, Esq., was 2nd.

Dahlias.—There was a very good show of Dahlias, but as a report of the National Society's show at the Crystal Palace will be found in this issue, we must be very brief in noticing this section of the present exhibition. The principal class was for sixty blooms of Dahlias of any kind, and the successful exhibitors were Messrs. Keynes, Williams & Co., Salisbury; Mr. F. W. Seale, Vine Nursery, Sevenoaks; and Messrs. W. Heath & Son, nurserymen, Cheltenham, in their respective order. All three lots were of good merit, especially that of Messrs. Keynes, Williams & Co., who put up a magnificent group of specimens. The same exhibitors were again 1st in the class for thirty-six, being followed by Mr. Rawlings, nurseryman, Romford; and Mr. F. W. Seale, Sevenoaks.

For twenty-four blooms, Mr. George Humphries, Chippenham, was 1st; and Mr. S. Mortimer, Swiss Nursery, Farnham, 2nd.

For twelve blooms the same exhibitor was again 1st, being followed in this instance by Messrs. Saltmarsh & Sons, The Nurseries, Chelmsford.

In the amateurs' class for twenty-four, Mr. J. T. West was successful, with a stand of first-rate merit.

Messrs. Cheal & Son, with an excellent stand, won for twenty-four Poms; and Mr. Geo. Humphries, Chippenham, for twelve bunches. Messrs. Cheal & Son were also 1st for twenty-four bunches of singles; and Mr. F. W. Seale, Sevenoaks, was 2nd. For twelve bunches, T. W. Girdlestone, Esq., Sunningdale, was 1st; and for six, the 1st was E. Mawley, Esq., Rosebank, Berkhamstead.

Messrs. Cheal & Son were again 1st for decorative Dahlias, and for twelve bunches of Cactus; whilst for six bunches, Mr. W. Hopkins, Cross Hands, Pining, near Bristol, was 1st.

Messrs. Laing & Son had a very fine stand of hardy flowers, boxes of Roses, some good double Begonias, and some thirty dishes of Apples, culinary and dessert. Another collection of herbaceous flowers and Lilies came from Messrs. Pitcher & Maud, Uxtable, Swanley. Mr. E. F. Such had also a collection of hardy herbaceous flowers, Roses, &c. Mr. Charles Turner stands of seedling Cactus and Pompon Dahlias. Messrs. Cutbush & Sons a group of hardy flowers. Mr. R. Dean a collection of dwarf and Runner Beans.

Messrs. Reid & Bornemann, Shrewsbury Road, Sydenham, exhibited a miscellaneous group of Chrysanthemums, stove and greenhouse plants, &c.—as pretty a group as we have seen for some time.

LOCAL SHOWS.

WARKWORTH FLOWER SHOW.—The thirty-third annual exhibition took place on August 22, in the courtyard of Warkworth Castle, by the permission of the Duke of Northumberland. Owing to a sunless season, there seemed to be a lack of competition. Roses, exhibited by Messrs. Harkness & Son, Bedale, attracted great attention. The principal prize-takers were:—Messrs. Harkness & Sons, Robson, Brown (Bedlington), J. Spoor, D. Wylam, J. Morris (Low Fell), N. Walker, Jas. Guy (Eastfield), R. J. Coulter, J. Wardle, A. Thompson, Jas. Thompson, Thos. J. Wilson (Warkworth), Geo. Robinson (Long Houghton), S. Egdell, and others.

SHERBORNE COTTAGE GARDEN SOCIETY.—The Cottagers' Garden Society, of which Mr. Wingfield Digby, M.P., of Sherborne Castle, is President and founder, held its second annual exhibition on August 31, in the grounds of the Old Castle at Sherborne. The weather was unpropitious, but, nevertheless, the show proved a success. The exhibits, numbering over 500, showed a considerable improvement in quality upon those of last

year. Of Potatoes, there were quite 150 entries, and the quality here displayed was high. Onions, Vegetable Marrows, Peas, Turnips, were also strong classes, and in every department of the exhibition there was a keenness of competition which at times gave the judges (Messrs. Crump and Pyper) trouble in the making of their awards.

DUNDEE.—The Dundee Horticultural Society's annual three days' show was opened on the Magdalen Green by Lord Kinnaird. His Lordship said that, according to his information, the exhibits on this occasion were up to the high standard previously reached by the Society, and he trusted that this manifested intelligent and marked progress in the sciences of horticulture, a progress which, he hoped, would grow deeper and deeper. It was clear, he said, that if they were to cope with the competition from abroad in the matter of fruit, they must be up and doing, and produce the best article. These horticultural societies were doing much for the moral and material progress of the country, and were assisting the people to use to the best advantage that leisure which, he hoped, they would gradually get more of.

STIRLING.—The annual show of the Stirling Horticultural Society was opened, Sept. 1, in the New Public Hall, ex-Provost Yellowlees performing the opening ceremony. The show was, as compared with previous years, a very good one, the exhibit of plants and flowers being especially fine; while fruits and vegetables were a large and splendid variety. The bee and honey exhibits were good, and altogether the show was an especially interesting one, notwithstanding the unpropitious weather of the past few days. The principal prize-winners were from Gargunnoch.

GREENLAW.—The eighth horticultural show, held Sept. 1, was entirely confined to amateurs, whose exhibits were in quality fully up to last year's. Pot plants were superior, and vegetables above the average.

GREENOCK.—The annual flower show of the Royal West Renfrewshire Horticultural Society took place, Sept. 1, in the Town Hall. The total entries were 846, as against 888 last year, the decrease being wholly in cut flowers, due, no doubt, to recent heavy rain. A special feature of the show was the wild flower section, for which a large number of prizes had been offered by the members of Greenock Burns Club. The entries in this section alone were sixty-nine, and some exceptionally fine collections were shown. The show was opened by Dr. N. G. Cluckie.

LOCKERIE.—The annual horticultural show was held here, Sept. 1. The entries numbered nearly 800. Pot plants were a splendid show, especially in the gardeners' department, this portion of the show being much enhanced by a selection for exhibition only from Sir Robert Jardine's Castlemilk conservatories.

LIVERPOOL AMATEUR GARDENERS' ASSOCIATION.—The Liverpool branch of the National Amateur Gardeners' Association held their monthly exhibition at the Common Hall, Mackinney, on September 1. There was a capital entry of exhibits, and many of the plants were of the finest description. On the conclusion of the judging, an interesting and instructive paper on "Carnations" was read by Mr. Norris, who has been a grower of this kind of flower for many years.

SHIFNAL FLOWER SHOW.—The twenty-sixth annual show of the Shifnal Cottagers' Horticultural Society was held on Sept. 1 in the Cricket Field. The exhibits were staged in a large tent, the centre of which was adorned with groups of plants exhibited not for competition. The principal group belonged to the President of the Society, the Rev. W. B. Garnett-Botfield. Adjoining it was a group shown by Mr. J. T. Brooke, of Haughton Hall, its chief attraction being Orange plants, together with Palms, Coleus, Gloxinias, Ferns, Dracenas, and Chrysanthemums. Mrs. Kenyon-Slaney sent a smaller and well-arranged group, containing Coleus, Vallotas, Ferns, and Geraniums, and also Dahlias, Carnations, and Picotees; whilst Miss Kenyon-Slaney and Miss Maud Kenyon-Slaney exhibited a fine collection of Sweet Peas. Collections of cut flowers were exhibited by Messrs. Jones & Son, nurserymen, of Shrewsbury, and Mr. J. H. White, nurseryman, of Worcester; and honey, by Mr. E. Hampton, of Hatton. The vegetables, exhibited by cottagers residing in the parishes comprising Shifnal Union, were of fine quality, and there was good competition.

SWALWELL.—The thirteenth annual floral and vegetable exhibition in connection with the Swal-

well Garden Protection Society was held in the beautiful grounds of Axwell Park on September 3. The exhibitors consisted almost entirely of the working-classes; the exhibits were quite up to the standard of other shows which make greater pretensions. The competition for the Ramsay Challenge Cup, which is valued at 6 guineas, and which is offered for the best three Leeks, proved a great attraction. The cup has been held during the past year by Mr. Robert Gardner of Dunston, but on the present occasion it was wrested from him by Mr. Lawrence Johnson of Gateshead. The Leeks shown were perhaps the finest that have been exhibited in the North during the present season.

PRUDHOE.—The thirty-eighth annual show in connection with Prudhoe and West Wylam Floral and Horticulture Society took place on Sept. 3 at Prudhoe. Compared with previous years, it was the largest show that has been held since the formation of the Society, whilst in point of excellence it has never before been equalled. Each department was greater in size, and the whole of the exhibits were of superior quality. There was a grand show of plants in pots. In the cut flower section, there was a choice variety of bloom, Dahlias, Carnations, Picotees, and hand-bouquets being very conspicuous. Fruit was of excellent quality, whilst vegetables formed one of the prominent features of the show. Messrs. Fell & Co., the well-known nurserymen of Hexham, had an attractive exhibition at the entrance of the show of exotic plants and cut blooms, including Roses and hardy flowers of the best kinds.

KENTON BAR.—Kenton Bar flower show was held on Sept. 3, in a field adjoining the village, and kindly lent for the occasion by Mrs. White, Kenton. The flowers and vegetables upon the benches were quite up to the average. In both divisions excellent specimens were noted. Among the flowers, Roses, whilst not largely in evidence, were far superior to many we have come across in the most important of local shows.

VARIORUM.

EXTINCTION OF BRITISH PLANTS.—Lovers of rural England are aware that changes are taking place in the fauna and flora of the country. In too many cases these changes possess a melancholy interest, for they savour of extinction. Birds and other animals have forsaken haunts which were once familiar to them, and plants of divers species have been exterminated in localities where they were once known to abound. Many and varied are the causes which have been in operation, but whilst some of them were inevitable, others it is equally certain are preventable. For five years a committee of the British Association has been collecting information as to the disappearance of native plants from their local habitats, and year after year it has reported the same story of suppression or extermination. This year it is the West of Scotland which has been the special area of observation, and about fifty species of native plants are recorded as having disappeared from places which not long since were included amongst their regular haunts. The graceful meadow Rue has vanished from a spot on the banks of the Clyde owing to some unascertained cause. The celery-leaved Crowfoot has disappeared from a locality in Dumbartonshire owing to the reclamation of a marsh. The superb Mountain Globe flower has become extinct at a place in Ayrshire. The quaint yellow-horned Poppy has been swept away by summer visitors on the coast of Argyllshire, between Danoon and Toward. The burnet-leaved Sweetbriar has been washed away by a high tide at Seamill, on the coast of Ayrshire. The island of Cumbrae, Buteshire, has been almost entirely bereft of its Primroses by fair depredators who should know better, "being carried off in basket loads by lady visitors." The very rare smooth Gromwell is rapidly disappearing from the Argyll shore, "being probably all gathered by collectors and summer visitors." At Stevenston, Ayrshire, the Viper's Bugloss, with its many-coloured flowers, has fallen a victim to drifting sand. At Cambuslaog, Lanarkshire, the exigencies of a new railway have led to the extinction of the lesser Skullcap. The fragrant

Sweetgale, or Bog-myrtle, has forsaken West Kilbride, Ayrshire, after the draining of a bog. At Kilwinning, in the same county, the quaint Bird's-nest Orchid has been rooted out by school children, whilst that sweet Orchid, the Heilebrine, has been cleared out of the Isle of Arran, for removal to gardens, where, in ungenial environments, it will probably perish. At Gourrock Burn, Ayrshire, the Daffodil has met with a similar fate. At Crosbie Glen, another locality in Ayrshire, the native Snowdrop was threatened in like manner, but luckily the proprietor intervened. Of Ferns, the black Spleenwort, the sea Spleenwort, the green Spleenwort, and the Maidenhair Spleenwort are being cleared out of the Western Isles and the Argyllshire hills, their roots being offered for sale in large numbers in the streets of Glasgow. Near Paisley the Ceterach has fallen a victim to a Fern dealer. At Portincross Woods and at Hindog Glen, in Ayrshire, the Hart's-tongue has almost disappeared. In the Island of Cumbrae the same Fern was growing abundantly fifty years ago, whilst now it is difficult to find a single specimen. "In summer the lady visitors were seldom seen leaving the island without a basket of Ferns, a practice carried on year after year, till now, when the Ferns are nearly exhausted, the gathering mania is passing from Ferns to Primroses," as intimated above. The royal Fern, *Osmunda regalis*, is vanishing, or has gone, from numbers of localities in the Isle of Arran, "having been carried away by cartload and boatload." The Fir Club Moss is disappearing from Mons, Ayrshire, owing to drainage, and from the Western Isles on account of the demand for sale in Glasgow. Cases such as these can unfortunately be paralleled in all districts of our island, and our towns are not as a rule so noted for their loveliness that we can afford to sacrifice without a protest any part of the wild Britain that still remains. The rarer a species happens to be, the greater is the mania amongst so-called "collectors" to exterminate it. At the present time the beautiful coral-seeded *Paeony* has been driven to its last foothold of British soil in one of the islands of the Bristol Channel. Those who know where the Snake's-heads dot the greensward in Oxfordshire, where the lovely Pasque flower revels in the soil of the Cotswold Hills in Gloucestershire, where the Lily of the Valley sheds its fragrance upon the air in the deep woods of Kent, or where the lurid *Asarabacca* lurks in the lanes of Wiltshire, render the best service by keeping their discoveries to themselves. *Morning Post, August 23.*

INCORRECTLY NAMED ROSES.

DURING the last few weeks I have had several lots of Roses forwarded to me, with a request that they might be named. Many of these had names attached to them, and it was remarkable how very few of them were correct. I am quite aware of the sometimes totally different character, as well as slight variations that many Roses assume in different districts and soils; but when one finds several of the plants sent to purchasers under the names of newer kinds, are no more or less than some of the old and out-of-date varieties with the names of our best new Roses attached, I feel it is time attention was drawn to the matter.

I can understand such transparent mistakes in naming as Climbing Forestier for Celine Forestier, and similar errors. In these cases I have no doubt the names were badly written in the first place, or were partially obliterated before being made secure and plain by the purchaser; with the result that after much scrutiny, the nearest name possible was made out of the few existing marks. A batch of Roses are to hand this morning from Scotland, and out of about fifteen varieties, only six are true. Even these are in some cases slightly mixed; for example, Climbing Forestier for Celine Forestier; Madame for Prince Camille de Rohan, &c. There are two sent as Dr. Andry, one being Duchess of Edinburgh, and one Prince Camille de Rohan; both of these were purchased as Dr. Andry, and my correspondent

assures me they were so named when received from the nurseryman. "Cheap (?) Roses," and those purchased at sales, are the most fruitful cause of wrong names. Unless more care be taken in this respect, "What's in a name?" will soon be unpleasantly true to the real lover of Roses.

I shall be very pleased indeed to assist, to the best of my ability, in naming any Roses my readers may be doubtful about, and if they will forward a full and a half-blown flower, with a little of the growth attached, I will reply to them at once.

Pack firmly, placing the stem of the Rose in a small piece of Potato, and using Spinach leaves, if possible, in preference to moss or cotton-wool, and post to A. Piper, The Nursery, Uckfield, Sussex.

THE INFLUENCE OF DEPTH IN THE SOIL ON GERMINATION.

THE vigour of vegetation during germination may depend on the depth at which the seed is planted in the soil. "There is a medium in all things," and care is not usually exercised upon this important condition of healthy development. If the seed be planted too near the surface, the seedling is not vigorous. The best depth for each species can only be determined by trial, but it does not in any way depend upon the size of the seed. KRAUSS has been experimenting in this direction lately, and has written a paper embodying his chief results in the *Forsch. aus d. Geb. d. Agriculturphysik* (it has also been translated into French, vide BONNIER'S *Rev. Gén. de Bot.*, iii., p. 438). It is curious to find that leguminous seeds are, within certain limits, indifferent to the depth at which they are planted. Vegetative reproductive organs, such as the eyes of Potatoes, are subject to the same law.

TRADE NOTICE.

MESSRS. PROTHEROE & MORRIS announce that they are about to enlarge their premises in Cheapside, E.C., by an additional sale-room on the ground-floor. It will be lit with the electric light, will communicate directly with the existing room, and will have a separate entrance from Queen Street, E.C. The sales of Dutch bulbs last year, we are told, averaged 12 tons weekly during the season, and Orchid sales take place twice weekly, and yet additional sale-room is required.

MARKETS.

COVENT GARDEN, September 8.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

No alteration. Business keeps very flat. *James Webber, Wholesale Apple Market.*

POTATOS.

MARKETS firm, at late quotations. J. B. Thomas.

SEEDS.

LONDON: Sept. 7.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the demand for Trifolium is now meagre. For winter Tares, which are very scarce, high rates are obtained. Rye continues firm. New Rape seed, being cheap and good, attracts attention. In Canary seed, the excitement on the market has somewhat abated, but nevertheless prices continue firm. Hemp seed remains firm at recent prices. The new Peas now showing are of good quality, and the prices asked are moderate. White sowing Mustard, which is very scarce, tends upwards. Linseed, Dani, and Buckwheat unchanged. Other articles offer no subject for remark.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (bushel), for the week ending September 3, and for the corresponding period last year:—1892: Wheat, 29s. 1d.; Barley, 24s. 2d.; Oats, 20s. 3d. 1891: Wheat, 41s. 8d.; Barley, 29s. 3d.; Oats, 21s. 8d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 110s.; do., inferior, 46s. to 75s.; Hay, best, 60s. to 105s.; do., inferior, 20s. to 50s.; and Straw, 26s. to 38s. per load.

FRUITS AND VEGETABLES.

SPITALFIELDS: Sept. 6.—Quotations:—English Apples, 2s. 6d. to 4s. per bushel; Pears, 2s. 6d. to 4s.; Egg Plums, 2s. to 2s. 6d.; Victoria do., 2s. 6d. to 3s. 3d.; Orleans do., 2s. 9d. to 3s. 6d.; Damsons, 3s. to 3s. 3d.; Green Gages, 3s. to 4s. per half-sieve; English Tomatos, 4s. per peck; foreign do., 6d. to 1s. 6d. per box; Seakale, 9d. to 1s. per punnet; Cabbages, 2s. to 2s. 9d. per tally; Spinach, 1s. 6d. to 2s.; French Beans, 1s. 6d. to 2s.; Scarlet do., 1s. to 2s.; Peas, 1s. 6d. to 2s. 6d. per bushel; Turnips, 2s. to 2s. 3d.; Carrots, 1s. 6d. to 2s. 3d.; Onions, 1s. 9d. to 2s.; Parsley, 1s. to 1s. 6d. per dozen bunches; Endive, 9d. to 1s.; Cabbage Lettuces, 2d. to 3d.; Leeks, 2s. to 2s. 3d.; Frame Cucumbers, 1s. 6d. to 2s.; natural do., 6d. to 9d. per dozen; Cos Lettuce, 3d. to 4d. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Belgian Onions, 2s. 9d. to 3s. 3d.; Dutch do., 2s. 9d. to 3s. 6d. per bag of 110 lb.; Spanish do., 4s. 3d. to 5s. 6d. per case; Horse Radish, 1s. to 1s. 2d.; Celery, 9d. to 1s. per bundle.

STRATFORD: Sept. 6.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Cabbages, 2s. to 3s. 6d. per tally; Cauliflowers, 1s. to 1s. 6d. per dozen; 3s. 6d. to 5s. per tally; Turnips, 1s. 6d. to 2s. per dozen bunches; Mangolds, 20s. to 22s. 6d. per ton; Beans, 1s. 6d. per sieve; Onions, English, 1s. 6d. to 2s. per dozen bunches; Port, 5s. 6d. to 9s. per case; Apples, English, 2s. 6d. to 3s. 6d. per bushel; eating, 3s. 6d. to 6s. 8d. do.; Cucumbers, 1s. to 2s. 6d. per dozen; field do., 7d. to 6d. do.; Scarlet Beans, 6d. to 1s. 6d. per sieve; 1s. to 2s. per bag; Damsons, 3s. to 3s. 3d. per half-sieve; Plums, 2s. to 3s. 6d. do.; Greengages, 4s. to 5s. do.; Pears, 1s. 6d. to 2s. per molley; 2s. 6d. to 3s. 6d. per half-sieve; Carrots, 2s. to 2s. 6d. per dozen bunches.

BOROUGH: Sept. 6.—Quotations:—Cabbages, 2s. 6d. to 4s.; Marrows, 2s. 6d. to 3s. per tally; Scarlet Beans, 6d. to 1s.;

French do., 1s. to 1s. 6d. per bushel; Peas, 2s. 6d. to 3s. 6d. per bag; Cauliflowers, 1s. to 2s. 6d. per dozen; Lettuces, 6d. to 1s. per score; Carrots, 2s. 6d.; Turnips, 3s. to 4s.; Parsley, 2s. per dozen bunches; English Onions, 3s. 6d. to 4s. per cwt.; Horse-radish, English, 2s. 6d.; foreign do., 2s. per bundle; English Apples, 2s. 6d. to 5s. per bushel.

FARRINGTON: Sept. 8.—Quotations:—Apples, cooking, 3s. to 3s. 6d. per bushel; do., Manx Coddins, 3s. 6d. do.; Pears, Hazel, 5s. to 6s. do.; Cucumbers, frame, 1s. 6d. per dozen; Plums, Victorias, 4s. per half bushel; do., Orleans, 4s. 6d. do.; Grapes, Lisbon, 9s. per box; Tomatos, 2s. per box of 18 lb.

POTATOS.

BOROUGH: Sept. 6.—Quotations:—English Magnums 50s. to 70s.; Hebrons, 50s. to 60s.; Snowdrops, 60s. to 75s. per ton.

SPITALFIELDS: Sept. 6.—Quotations:—Magnums, 50s. to 60s.; Sutton's Early Regents, 50s. to 60s.; Imperators, 50s. to 60s.; Hebron, 50s. to 65s.; Early Rose, 50s. to 55s.; White Elephants, 55s. to 60s.; Snowdrops, 60s. to 80s.; Sutton's Abundance, 50s. to 65s.; Fillbaskets, 50s. to 60s.; Reading Giants, 50s. to 60s. per ton.

STRATFORD: Sept. 6.—Quotations:—Magnums, light land, 55s. to 65s.; do., dark land, 50s. to 55s.; Hebron, 60s. to 70s.; Snowdrops, 60s. to 70s.; per ton.

GENERAL AVERAGES: Sept. 7.—Hebrons, 60s. to 75s.; Magnums, 60s. to 70s.; Snowdrops, 65s. to 80s.; Imperator, 50s. to 60s.; Kilmays, 60s. to 65s.; Early Regents, 50s. to 60s. per ton.

FARRINGTON: Sept. 8.—Quotations:—Snowdrops, 60s. to 70s.; and Magnum Bonums, 60s. to 70s. per ton.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
- 10, Ireland, S.; (* Channel Islands)

THE PAST WEEK.

The following summary record of the weather for the week ending September 3, is furnished from the Meteorological Office:—

"The weather during this week was extremely unsettled, with frequent and heavy falls of rain in all districts. Thunderstorms were experienced over the northern parts of England on Tuesday, and again at a few stations on Saturday.

"The temperature just equalled the mean in 'England, S.' and slightly exceeded it in the 'Channel Islands.' In all other districts it was below, the deficit in the north and east of Scotland being 4°. The highest of the maxima were registered during the earlier part of the period, and ranged from 73° in the 'Channel Islands,' 72°

in 'England, E.' and 71° in the 'Midland Counties' and 'England, S.' to 63° in 'Scotland, W.' and 60° in 'Scotland, N.' The lowest of the minima were recorded either on August 29 or September 3, when the thermometer fell to between 32° and 35° in Scotland, to between 40° and 42° in Ireland, and to between 37° and 45° in England. In the 'Channel Islands,' the thermometer did not fall below 51°.

"The rainfall exceeded the mean in all districts. Over the Kingdom generally the fall was more than twice as much as the normal, and in some of the north-western districts more than three times as much.

"The bright sunshine was below the mean very generally, but exceeded it at some of the extreme northern stations. The percentage of the possible duration ranged from 47 in the 'Channel Islands,' to between 34 and 38 over the greater part of England, to 26 in 'Scotland, W.,' 25 in 'Ireland, N.,' and 22 in 'Scotland, N.'"

NOTICES TO CORRESPONDENTS.

* PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

ASSESSMENT OF GREENHOUSES: G. C. See p. 308, of present issue.

BOOKS: G. E. Domestic Floriculture, W. Burbidge, published by W. Blackwood & Sons, Edinburgh and London.—Select Ferns and Lycopods, by B. S. Williams, Victoria Nurseries, Upper Holloway, N.; published at same place.—W. S. Carnation Manual, published by Cassell & Co., Limited, London. Free to members of the Carnation and Picotee Society.

CORRECTION: In report of Earl's Court Show in last issue, the Gold Medal accredited to Messrs. Butt & Son, was awarded to Mr. Geo. Monro, who, after stating, sold the whole exhibit to Messrs. Butt & Son.

EXHAUSTED SOIL: Slugs. Could you not remove one or two of the trees, or, failing that, have them reduced somewhat by careful lopping? The land might be improved by deep digging, but avoid trenching it, unless it has been so treated in times gone by. If the subsoil has not been touched, about 1 or 2 inches, if it be clayey stuff, might be spread over the surface, doing this before winter sets in. Gravel is best left alone. An equally thick layer of strong adhesive top-spit loam from a pasture would be of more immediate benefit to plants; and a heavy dressing of half-rotted stable-dung would do much good dug in without letting it waste its goodness by laying on the surface for any length of time. Liming the soil of an evening in damp weather will do much to lessen the slug plague. These creatures may be caught by means of Cabbage-leaves and heaps of bran laid about the garden. Pieces of hoard or slate placed just above the soil make good harbouring-places, and many may be trapped in this way. Deep digging will lessen their numbers, and a few pintoed ducks or a sea-gull would help to make a clearance of them.

FUNGUS: K. E. There are no means by which you can get rid of the fungus spores on the Ferns, but you could hunt out all the fungus whilst still immature. It grows in decaying wood, &c.

GRAPES: R. E., Hardwick. The berries are affected with "spot," a disease for which there is no known cure. See p. 286 in our last issue.

GRAPES AND VINE LEAVES: A. H. J. The leaves are literally being devoured by thrips, red-spider, mealy bug, &c., and the berries are just such as one would expect to find with leaves in such a bad state as are these. The fruit should be cut and given to the pigs, and the viney, if possible, exposed fully to the elements. If the laterals are growing at the usual length, cut them back to about 1 foot from the main stem. Clear out and burn all these trimmings, also all fallen leaves. Shovel out the upper crust of soil to a depth of 2 to 3 inches, and top dress. It may be necessary to replant in fresh soil the whole of the Vines, but of the necessity for that we are unable to judge from the samples of fruit and leaves sent. Lime-wash the walls twice, wash with soap and water all woodwork and the glass, and in the winter

clear the Vines after finally pruning them of all loose bark. Paint the whole of the wood with petroleum emulsion or some kind of smothering mixture like clay, cow dung, soot, and Gishurst's soap at the rate of 4 oz. to the gallon of other ingredients. This should be rubbed well into all cracks and crevices. Buy the *Vine and Vine Culture* by Mr. A. E. Barron, published at 171, Fleet Street, or *Grape Growing for Amateurs* by Mr. E. Molyneux, published by L. Upcott Gill, 170, Strand, W.C.

GRASSES FOR BINDING SAND-HILLS WASHED BY THE SEA: *A. M. Elymus arenarius* and *Arundo arenaria*.

LINDLEY'S VEGETABLE KINGDOM: *J. M., New Jersey*. There is no modern edition of this. The nearest approach to what you want is in Henfrey's Elementary Course of Botany (*J. Van Voorst, Pater-noster Row*).

NAMES OF FRUITS: *S. J. M., Kelso*. Apple: Keswick Codlin.—*Carter & Co.* Plum: Duke of Edinburgh.

NAMES OF PLANTS: *Thos. C. & Sons*. *Astrantia helleborifolia*.—*W. H. D.* A Boragineous plant, allied to *Cynoglossum*. We regret we cannot get nearer to it, but the specimen had collapsed before we got it.—*Constant Reader, W. 1*, *Helleborus foetidus*; 2 *Spiraea Lindleyana*; 3 *Geranium sylvaticum*; 4 *Rudbeckia speciosa*; 5 *Agrostemma coronaria*; 6 *Pulmonaria officinalis*; 7 *Chelone obliqua*; 8 *Helenium autumnale*; 9 *Kerria japonica*, double flowered var.—*B. F.* *Medicago echinus*, the Calvary Clover.—*Constant Reader, 7*, *Impatiens Roylei*. Send the Gooseberries to a grower of these fruits.—*W. S.* *Veronica Andersoni*. We cannot name the *Fuchsias*, send them to some grower.—*C. W. D.* *Veronica* next week. The *Sedums* are both varieties of *S. maximum*.—*M. R.* We cannot give you further information than the following:—1, *Ulmus Berardi*; 2, *Virgilia lutea*; 3, *Ulmus viminalis* var.; 4, *Quercus Corris* variegata; 5, *Ulmus*; 6, *Quercus*; 7, *Fraxinus*; 8, not recognised; 9, *Crataegus*; 10, *Ulmus*; 11, *Sambucus nigra*; 12, *Fraxinus*.—*B. L. 1*, *Rudbeckia Neumanni*; 2, *Helianthus decapetalus*; 3, *Helenium autumnale*; 4, next week; 5, *Rudbeckia Neumanni*; 6, *Helenium autumnale*; 7, *Symphytum asperillum aureo variegatum*; 8, *Rudbeckia Neumanni*.—*G. H. 1*, *Alnus cordata*; 2, *Panicum plicatum*; 3, *Reineckia carnea* variegata.—*A. Fairbairn, 1*, *Solidago canadensis*; 2, *Eranthemum variegatum*; 3, *E. aureum reticulatum*.—*Enquirer, 1*, *Adiantum formosum*; 2, *A. decorum*; 3, *Aspidium falcatum*; 4, *Adiantum tenerum*; 5, *Davallia bullata*; 6, *Adiantum Mariesii*.—*T. R.* *Cattleya Loddigesii*.—*G. P. H.* *Oncidium incurvum*.—*J. M. 1*, *Polypodium glaucum*; 2, *Aspidium pungens*; 3, *Phyllanthus nivosus variegatus*; 4, *Magnolia* sp., send when in flower; 5, *Begonia Digswelliana*.—*G. H., Brighton, 1*, *Abelia rupestris*; 2, *Hibiscus syriacus* fl.-pl.; 3, *Begonia discolor*.—*T. Inrie & Sons*, *Senecio elegans*.—*C. C., Brighouse*, *Lysimachia vulgaris*.

PEACH: *G. H.* There is a mould on the skin, but it is unknown to us; and, moreover, we cannot tell if it is the cause or the consequence of the disease. It has nothing to do with *Glaeosporium*, the ordinary destructive germs upon fruits. Another season, a timely application of one of the accepted remedies against mildew might be of service.—*R. H.* No insects or fungus, but probably a root-rot, caused by lack or excess of nutriment—most likely the latter.

RHUBARB: *Amateur*. The price for planting roots should not exceed 6s. to 8s. per dozen. The plant may be raised from seed, but the produce would be very varied in character, and you would have to wait at least three years before the plants afforded usable stalks. Sow in March in a cold frame, and prick off when large enough to handle. Early varieties are *Myatt's Linnaeus*, *Kershaw's Paragon*, and *St. Martin*.

SAM DEARDS' PATENT SELF-WATERING SHELF
FOR PLANTS ON SHELVES.

Now on view at Stand 11, Block A, Horticultural Exhibition, Earl's Court, S.W.

- ITS ADVANTAGES ARE—
- 1st.—No waste of water, all water being absorbed by the plants.
 - 2nd.—Saving of three-fourths of the labour in watering.
 - 3rd.—The plants are watered more naturally than by any other method.
 - 4th.—All drip and water dropping from shelves to plants beneath entirely prevented.
 - 5th.—Not a drop of manure-water is lost, all being absorbed by the plants.
 - 6th.—A boy can do the work of a man.
 - 7th.—A row of plants 100 yards long can be watered without walking a yard to do it.

To Head Gardeners and others.

WANTED, a SLEEPING PARTNER, with £200 capital, in a SEED and FLORISTS' BUSINESS, in London. Good interest, and fullest particulars given; a safe investment.—ARTUS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

PARTNERSHIP.—A GENTLEMAN is open to join a well-established firm of Nurserymen and Florists, requiring additional capital, for the purpose of extending their business.—PARTNER, *Gardeners' Chronicle* Office, 41, Wellington Street, Covent Garden, W.C.

WANTED, a HEAD WORKING GARDENER, for Surrey. Age 35 to 40, married, no family. Both able-bodied. Thoroughly experienced in Vines, Greenhouse and Kitchen Garden, Lawns and Strata. Cottage on premises.—Apply by letter, stating full particulars, to H. G., 6, Queen's Gardens, Eastbourne.

WANTED, a GARDENER and WIFE, without children. Must understand Glass Culture for the Market. Wife to attend to House. Wages 21s. per week, with House, Coals, Lights, and Vegetables.—S. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a GARDENER, where a good strong lad is kept. Must be well up in Greenhouse, Kitchen, and Pleasure Garden. State age, experience, with copies of testimonials, &c., wages, 23s. per week, to A. EVANS, Lythe Hill, Haslemere.

WANTED, a WORKING GARDENER, where all assistance needed is given, AT ONCE, in Berkshire. Must be well up in Outside and Inside Mushroom Growing, Cucumbers, Melons, and Forcing Early Vegetables. Only small amount of Glass.—Apply by letter, in first instance, stating wages and references, to R. N. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a good PROPAGATOR and GROWER for soft-wooded stuff; a man who thoroughly understands his business in a Market and Retail Nursery, where a general collection is grown. None need apply unless they are competent men.—Apply by letter only, and state age, experience, character, and wages required, to W. CLEMENTS, Nurseryman, Church End, Finchley, N.

WANTED, GARDENER or GROWER, sound and practical, to take entire management of a business where fruits and flowers are grown exclusively for market. Must be able to command a small capital, taking a share of the profits as his own remuneration. This is a sound and liberal offer to a good man.—W. L., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED IMMEDIATELY, an UNDER GARDENER, married, without family, to live in a lodge. Must thoroughly understand Vegetable and Outdoor Gardening, and have first-rate recommendations.—Apply, MAJOR TURNER, Pinkney Park, Malmesbury, Wilts.

WANTED, a young MAN, as PROPAGATOR (Indoors), with a thorough knowledge of Roses, Clematis, Carnations, and Soft-wooded Stuff. Must also be able to make up Wreaths, Bouquets, &c.—State age, wages, and experience to A. B. C., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a young MAN, as PALM GROWER, under a Foreman—State experience, and wages expected. Also a strong LAD for Soft-wooded Department.—W. FROMOW AND SONS, Sutton Court Nurseries, Chiswick.

WANTED, an experienced GROWER.—Must be good at Eucharis, Stephanotis, &c.—H. DICKINSON, Shardlow, near Derby.

WANTED, as FLOWER GARDEN FOREMAN, a young MAN of intelligence and perseverance, who has some experience with Roses and Herbaceous Plants, would find this a comfortable situation. Apply, in first instance, to THOS. BUTCHER, Seed Merchant, Croydon.

WANTED, for a Nursery in Ireland, a thoroughly practical and experienced FOREMAN and PROPAGATOR (Inside and Out). None need apply whose character will not bear the strictest investigation. Liberal terms to a suitable man.—Apply, S. R., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a WORKING FOREMAN (married), for the Pleasure Grounds here. Wages, 24s. per week, with House, Firing, Gas, and Vegetables. To take charge of six men.—Apply by letter to JOHN HORTON, The Gardens, Welbeck Abbey, Worksop, Notts.

WANTED, a young MAN for the Houses.—Quick at Potting, Tying, and Watering, and to take Turn at Fires.—State references to G. WATTS AND SONS, Palace Nurseries, Bournemouth.

WANTED, a steady industrious Man, as GARDEN LABOURER. Wife as thorough Landress. Cottage and garden found. State age, length of character, and wages required. Large family objected to.—J. ASHLEY WALLER, Beadham Court, Newbury, Berks.

WANTED, a young MAN, for the Houses, under a Foreman.—Must have experience in Watering and Airing; also energetic and willing. One who has gained his experience in a private place preferred. Permanent situation. Wages 20s., with a rise if satisfactory.—MILNE, Florist, Hampton Hill, Middlesex.

WANTED, for Orchid Houses, an energetic young MAN, about 20, one who is thoroughly reliable, and whose character will bear the strictest inquiry.—Apply at once to S. S. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a smart LAD, about 15 to 17, to help with Garden and Cows. Must have had experience.—Apply by letter, stating wages required and all particulars, to C. F. A., Town Court, Orpington, Kent.

WANTED, a young MAN, to act as SALES-MAN, in local markets two or three days a week; one with some knowledge of growing for market, and used to driving preferred. Must be pushing and thoroughly reliable; both on place.—Apply with references, and stating wages required, to GILBERT DAVIDSON, Ammanford, R.S.O., S. Wales.

WANTED, a SHOPMAN (Married).—Thorough knowledge of Floral Work, Seed and Bulb Trade. Energetic and obliging. Only those with first-class references need apply. State age, family, and wages required. Send copy of testimonials.—E. A. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED IMMEDIATELY, young LADY for Suburban Florists' Shop. Good at Wreaths. Good references.—Address, WEIGHTMAN, Florist, 2, Church Lane, Leytonstone.

COWMAN.—Age 24, single; good Milker, and can be useful; six months' good character.—**A. F.**, Stroud's Cottage, School Lane, Sunbury-on-Thames.

HOLLOWAY'S OINTMENT and PILLS.—Much watchfulness must be exercised at the present time, and the earliest evidences of ill-health must be immediately checked or a slight illness may result in a serious malady. Belaxed and Sore Throat, Diphtheria, Quinsy, Coughs, Chronic Cough, Bronchitis and most other pulmonary affections will be relieved by rubbing this cooling Ointment into the skin as near as practicable to the seat of mischief. This treatment, so simple and effective, is admirably adapted for the removal of these diseases during infancy and youth. Old Asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have brought round many such sufferers and re-established health after every other means had signally failed.

KENT—THE GARDEN OF ENGLAND.

GEO. BUNYARD & CO.,

THE OLD NURSERIES, MAIDSTONE.

SPECIALTY—FRUIT TREES.

Healthy, Well-rooted, True to Name.

“Modern Scientific Fruit Culture
obtains throughout these Nurseries.”

NO STARVELINGS. NO BLIGHT. INSPECTION by every Lover of Horticulture earnestly solicited.

G. B. & Co. beg to notify that they confidently believe their collection of **FRUIT TREES** for this season's delivery is the best yet grown at Maidstone or elsewhere, and no pains have been spared to ensure all being **TRUE TO NAME**. The extensive stock (embracing 800 kinds, in 600,000 examples), is cultivated with scientific care, and is, in consequence, healthy and vigorous, free from Canker, American Blight, and Disease, and presents that wealth of foliage, with sturdy ripened growth that characterises the **MAIDSTONE FRUIT TREES**, and fits them for all positions.

Henfield, Sussex.

Abutting on the London, Brighton, and South Coast Railway, about ten minutes' walk from Henfield Station. By Order of the Trustees of the late S. Clarke, Esq.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on WEDNESDAY, September 28, at 2 o'clock, in Three Lots, the exceedingly choice FREEHOLD MARKET GARDEN and NURSERY, most favourably situated, and known as the Henfield Nurseries, Sussex, comprising a modern and convenient brick-built Residence, Twenty-two Greenhouses and Vineries, all heated; Pits, brick-built Stabling, and other Trade Buildings. Also Cottages, and another Dwelling-house, Orchard, and productive Market Garden and Nursery Land, the whole containing an area of about 11 Acres. Possession will be given on completion of the purchase.

Particulars and plans had at the Mart; of Messrs. Howlett & Clarke, Solicitors, 8, Ship Street, Elington; and of the Auctioneers and Land Agents, 67 and 68, Cheapside, E.C.

Heaton Norris Nurseries, near Stockport and Manchester, ten minutes' walk from Heaton Norris on the London and North Western line, Manchester to Crewe.

ABSOLUTE CLEARANCE SALE, Without Reserve, by order of Messrs. G. and W. Yates, who are relinquishing this branch of the business in order to devote their whole attention to the seed trade.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION on the Premises, the Nurseries, Green Lane, Heaton Norris, near Stockport and Manchester, on MONDAY, October 3, and THREE FOLLOWING DAYS, at 12 o'clock precisely, the whole of the valuable NURSERY STOCK, covering 12 acres of ground, comprising 5000 ornamental Flowering and Foliage TREES and SHRUBS, 6000 Hybrid and Named RHODODENDRONS, including Waterer's and other exhibition varieties, these being a specialty; RHODODENDRON STOOLS full of layers; 6000 CONIFERS and Evergreen BORDER SHRUBS; 7000 fine HOLLIES, including many specimens 3 to 6 feet; 10,000 FRUIT and ORNAMENTAL TREES; 30,000 Privet HOLLIES, and quick for hedges; ROSES, IVIES, CLIMBERS, HERBACEOUS PLANTS, and OTHER STOCK.

Also eight span-roof GREENHOUSES, 40 to 60 feet long; 150 feet of FRAMES, three BOILERS, almost new; nearly 2000 feet of 4-inch PIPING, &c.

May be viewed. Catalogues had on the Premises, at the Seed Warehouse, 25, Market Place, Manchester, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

N.B.—The LAND, about 10 acres, TO BE LET, rent £3 per acre. The Nurseries are only 6 miles from Manchester. There is a good opening for anyone wishing to embark into the nursery business. The incoming tenant would have the opportunity of purchasing at the sale such stock as he might require at Auction prices.

Worcester.

HIGHLY IMPORTANT UNRESERVED SALE of about 20 Acres of NURSERY STOCK, by order of Messrs. Richard Smith & Co., in consequence of a portion of their land in the City boundary being required for Building purposes.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION, on the Premises, the Saint John's Nurseries, Worcester, on MONDAY, October 17, and four FOLLOWING DAYS, about 10 acres of unusually well-grown NURSERY STOCK.

Amongst the principal items may be mentioned 25,000 STANDARD and PYRAMID ORNAMENTAL TREES, in great variety, from 4 to 18 feet; 12,000 specimen CONIFERS and EVERGREENS, from 15 to 12 feet; 2500 golden Yews, grand plants; 1600 Standard and Pyramid gold, silver, and green HOLLIES; a magnificent lot of CLEMATIS, in splendid variety, including 2000 Clematis Jackmannii, and others.

Detailed particulars will appear in future announcements.

Woking, Surrey.

A short distance from the Woking Railway Station. UNUSUALLY IMPORTANT FIVE DAYS' UNRESERVED SALE

Of exceptionally well-grown and rooted NURSERY STOCK, in the finest possible condition for transplanting, and embracing the most important lot of Stock offered by Auction for many years, the quality of which is unsurpassed in the Trade, by order of the Trustees of the late Mr. George Jackman, the land being required for Building.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the Woking Nurseries, Woking, Surrey, on MONDAY, October 10, and four following days, commencing at 12 o'clock precisely each day, several acres of exceptionally well-grown

NURSERY STOCK.

The whole of which is in the best possible condition for removal; comprising—10,000 CONIFERS, 3 to 9 feet, amongst them numerous fine specimen Conifers.

Thousands of smaller EVERGREENS and CONIFERS, for Potting, &c. 1000 BOX, in variety. 10,000 Green and Variegated HOLLIES, 1 to 5 feet.

300 LAURELS, of sorts, 1 to 5 feet. PORTUGAL LAURELS, 5000 Named RHODODENDRONS, Hybrids, &c., 1 to 3 ft.

A fine collection of ORNAMENTAL DECIDUOUS TREES, comprising Maples, Thorns, Almonds, Peaches, Planes, Poplars, &c., 7 to 10 feet.

1000 LIMES, 5 to 10 feet. FOREST TREES in great quantities; amongst them several thousands of Sycamores, Oaks, Beech, Spruce, Limes, Poplars, &c.

5000 Common ASH, 2 to 5 feet. 40,000 QUICK, 1 to 2½ feet. 20,000 ST. JOHN'S WORT.

A splendid collection of ORNAMENTAL TREES, for Park and Avenue Planting, 10 to 20 feet, including Horse Chestnuts, Purple Beech, Scarlet Oaks, Lime, Planes, Sycamores, Maples, Elms, Poplars in variety, &c.

25,000 FRUIT TREES, comprising Standard, Feathered, and Single Cordons, Apples, Pears, Plums, and Damsons. 3000 Standard and Feathered Flowering Almonds, Peaches, Prunes, Pissardi, and other Stock.

The Auctioneers have personally inspected the Stock, and desire to call the attention of intending purchasers to this important Sale. It is undoubtedly the most important Auction of Nursery Stock held for many years, and an inspection will well repay a visit by those contemplating planting during the season.

May be viewed any day (Sundays excepted) prior to the Sale. Catalogues may be had on the Premises, or of the Auctioneers, Land Agents, and Valuers, 67 and 68, Cheapside, London, E.C.

Sunningdale.

A few minutes' walk from Sunningdale Station. THREE DAYS' CLEARANCE SALE WITHOUT RESERVE

FIXED.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.; 15-in., 8s.
 (The larger sizes are very strong for carriage drives.)

Full Particulars on application. Testimonials:—

From Mr. J. WILLARD, Head Gardener to the BARONESS BURDETT-COUTTS, Holly Lodge Gardens, Highgate, N., July 12, 1892.—“Dear Sirs, Having given your Improved Garden Gully a fair trial, I may say that it proves in use all that you claim for it, and in my opinion has, for the sides of walks and drives, many advantages over the ordinary grating. Perhaps the best proof I can give you of this is that, as opportunity offers, I intend to use them instead of gratings. Faithfully yours, J. WILLARD.”—To Messrs. VINCE & VINE.

From W. WALTON, Esq., Secretary to the LONDON CEMETERY COMPANY, The London Cemetery Company, 29, New Bridge Street, Blackfriars, E.C., July 25, 1892.—“To Messrs. VINCE & VINE, Highgate. I am very happy to testify that your Patent Garden Gully-Frames in lieu of the old fashioned gratings answer admirably. They were by my authority fixed in a new pathway made in Highgate Cemetery, and in the recent thunder showers they were severely tested and were

most effectual in preventing the scouring of the gravel. At the inspection my Directors were much pleased with them, and gave instructions that they were to be used when required at Nunhead Cemetery.—I am, yours truly, W. WALTON, Secretary.”

From Messrs. CUTBUSH AND SON, Highgate and Barnet Nurseries.—“Highgate Nurseries, London, July 27, 1892.—Dear Sirs,—Referring to the Improved Garden Gully you fixed for us some months ago, we are glad to say it answers admirably. As you are aware, our Nurseries here are very hilly, and during the recent storms all the ordinary gullies were blocked, whereas yours was in good working order. We shall not hesitate to recommend the same to anyone requiring the gullies for sides of paths and carriage-drives, and we feel certain, when it is known, there will be a great demand.—We are, yours faithfully, WM. CUTBUSH AND SON.—Messrs. VINCE & VINE.”

R. HALLIDAY & CO.,

HOTHOUSE BUILDERS and HOT-WATER ENGINEERS,

ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vineries, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm, from the smallest to the largest. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Sashes, Hotbed Boxes, &c., always in stock.

Plans, Estimates and Catalogues free. Customers waited on in any part of the Kingdom.

Our Maxim is and always has been—

MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSINGER & COMPANY, LOUGHBOROUGH.

VICTOR POTATOS (SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlys for market use. Quality and yield all that could be desired. One well known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatoes have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.

Price per cwt. and ton. State requirements to
W. W. JOHNSON & SON,
 Seed Growers and Merchants Boston, Lincolnshire.

LILIAM WALLICHIANUM SUPERBUM.

HUGH LOW & CO.

Have a grand lot of this magnificent LILY, well advanced in bud.

CLAPTON NURSERY, LONDON, N.E.

THOUSANDS OF IMPORTED ODONTOGLOSSUM ALEXANDRÆ AND ITS VARIETIES.

Collected by the *employés* of Mr. JOHN CARDER (late of the firm of Messrs. SHUTTLEWORTH, CARDER & Co.).

MESSRS. FRED HORSMAN & CO., Colchester have much pleasure in announcing the safe arrival of the above Superb Collection. *They are of the Best Type*, and will not fail to yield like those hitherto sent, superb spotted forms, regular in outline, and with grand markings. All the Consignment will be offered by—

MESSRS. PROTHEROE & MORRIS, 67, Cheapside, on FRIDAY, Sept. 23.
N.B.—These Plants have the Cool Season before them, and cannot fail to flower well next Spring.

ALSO A QUANTITY OF
UNFLOWERED, SUPERBLY-GROWN CATTLEYS,
With Splendid Sheaths, for Winter and Spring Blooming.

The Sale will be altogether an attractive one, as very Choice Orchids in Spike and Bud will be offered from the same establishment.

HORTICULTURAL BUILDER.

Every description of GREENHOUSES, LIGHTS, &c.

PIT LIGHTS.

Best quality and workmanship, 2 inches thick, 6 ft. by 4 ft., iron bar across and very strong, 4s. 6d. each, 50s. doz., £10 for 50 lights, free on rail in London. Cash or reference with order.

CUCUMBER HOUSES.

Timber sufficient to build 100 feet by 12 feet house, lights, door, &c. Put on rail in London. Price, £9 10s. Send for detailed specification, to

W. DUNCAN TUCKER, HORTICULTURAL WORKS, TOTTENHAM.

 Send for Illustrated Catalogue, just issued.

The International Horticultural Exhibition,

EARL'S COURT, LONDON, S.W.

A GRAND INTERNATIONAL POTATO EXHIBITION

Will be held by the Executive of the International Horticultural Exhibition, in connection with the

SHOW of HARDY FRUIT, at Earl's Court, London, S.W., on OCTOBER 5, 6, and 7, 1892,

When PRIZES to the amount of £100 will be offered, also a GOLD MEDAL for the most meritorious Collection of Potatoes, and a SILVER MEDAL for the best Dish of Potatoes in the Exhibition.

Applications for Schedules and full particulars should be made to the SECRETARY, International Horticultural Exhibition, Earl's Court London, S.W.; or to P. McKINLAY, 24, Upper Thames Street, London, E.C.

ODONTOGLOSSUM CRISPUM ALEXANDRÆ.

BEST VARIETY.

GUILLERMO KALBREYER begs to offer the above well-known and justly-prized Orchid at the following prices, free on board of Royal Mail Company's steamers, at Savanilla:—£40 per 1000 good and healthy pieces.

G. K. also can supply:—

ODONTOGLOSSUM LUTEO-PURPUREUM,
" CUSPIDATUM PLATIGLOSSUM,
£36 per 1000.

CATTLEYA TRIANÆ, best variety, £8 per case.

Each case contains from fifty to sixty good, strong pieces, and measures about 20 inches by 34 inches.

The plants are packed with the greatest care and best method, but under no circumstances will G. K. hold himself responsible for the state of plants on their arrival in Europe. *Conditions*:—All Consignments are shipped entirely at Buyer's risk and expense from port of shipment. Plants ordered must be paid for on receipt of bill of lading to Messrs. ROESING BROTHERS AND CO., 10, Basinghall Street, London, E.C., who will then give orders for forwarding the consignment to the Purchaser.

The best time for dispatching Orchids from here, and to establish them with the best advantage in Europe, are the months—December to April.

Address:—G. KALBREYER, La Flora, Bogota, Republica de Colombia.

Cablegram Address:—FLORA, BOGOTA.

STRAWBERRIES.

No place in the world equals Swanley or Eynsford, either for Fruit or Plants. Our 6 acres in 60 best kinds are now full of lovely Runners and Plants for immediate dispatch. Send for a CATALOGUE, giving the secrets how to have the finest possible crops at once.

Special Prices for large quantities.

Col. BROCKMAN, Dodsley, Midhurst, July 5.
"The Strawberries supplied by you last year are giving splendid results. Col. B. will write again shortly for more plants."

B. S. WILLIAMS & SON

Victoria and Paradise Nurseries,
UPPER HOLLOWAY, LONDON, N.

THE
Gardeners' Chronicle.

SATURDAY, SEPTEMBER 17, 1892.

BODNANT.

BODNANT is situated on the east side of the Conway Valley, within the influence of the sea breeze, but protected in the lower parts by the high hills. From the lawn a fine prospect, embracing about 60 miles of mountain scenery, is to be seen. The soil is not rich, being shallow, and resting upon the Wenlock flags and shales of the upper silurian formation.

The garden was originally designed and laid out by the late Mr. Milner, but in recent years the taste of the proprietor, H. D. Pochin, Esq., aided by the skill of his gardener, Mr. Saunderson, has been mainly directed to the beautifying of the glen. The higher parts are planted with hardwooded deciduous trees, which afford sufficient shelter to the specimen Conifers, the latter making very rapid growth, and are of a beautiful colour. The effect of the Conifere is much improved by the judicious mixture of bright deciduous trees and shrubs, such as the rich purple Prunus Pissardii and purple Hazel, clumps of Cornus sanguinea, scarlet Dogwood, and groups of flowering shrubs, such as Berberis, Rubus, Cotoneaster, Hypericum, &c., giving brightness without suggesting any artificial character to the place. Considerable labour has been spent in this part, forming the banks of the trout stream with slabs of the native rock, for what is now a pleasant stream is in winter a rushing torrent, carrying tons of earth along with it. The Cyclamen, Spireas, Yucca filamentosa, Primulas, Daffodils, &c., which border the stream, are protected from the winter floods by the turf in which they grow. There is scarcely a bare spot in this dell, the ground underneath the trees being clothed with St. John's Wort, Mahonia aquifolia, and Ivy. Where the rock appears on the surface, it has been planted with Sedums, Saxifrages, and hardy Heaths. Cotoneaster congesta makes a capital covering for stones.

Rustic bridges, some of wood, others simply large rough slabs of stone, cross the main stream and its tributaries, and shelter is afforded where some of the paths cross each other by little sheds with thatched roofs, over which Honeysuckle grows. A border of choice herbaceous plants runs along a path between the dell and an adjoining field. This border is effectively edged with Heaths; the best for this purpose seems to be Erica vagans, being neat and compact. Among many choice groups, Oenothera speciosa attracts attention by its large white flowers and peculiar scent, and Tropaeolum tuberosum is a beautiful object on the railings. This path leads to a mausoleum, built on a crag overlooking the dell: the interior is a superb work of art, being formed of choice marbles, carved and polished, and the interior is dimly lighted by some rich stained glass windows.

Sent men by Royal Warrants to H.M. the Queen and H.R.H. the Prince of Wales.

WORDSLEY, STOURBRIDGE.

The grounds immediately surrounding the residence are planted with a very large variety of choice shrubs, all in groups. *Garrya elliptica*, both male and female plants, the former appearing at its best in spring, when its long pendulous catkins are seen, and the latter looking its best in the autumn, with its Grape-like bunches of purple berries. Clumps of *Pernettyas*, *Gaultherias* Shallon, Ghent Azaleas, *Andromedas*, *Phillyreas*, *Ericas*, and beds of *Rosa rugosa* and *Rosa pyrenaica*, both with brilliant scarlet hips, form a fine feature on the lawn. Specimens of rich yellow *Cupressus Lawsoniana lutea*, about 10 feet high, harmonise with the flower-beds. Two ornamental pieces of water filled with plants fed by a spring from the mountain-side, and it is said the water never falls below 50° F., even in winter, so that *Aponogeton distachyon* flowers about nine months out of the year.

A specimen of *Eucryphia pinnatifolia*, 7 feet high, is now full of white flowers, also *Hypericum Moserianum*. The walls of the hall are covered with *Pyracantha Lelandi*, which is most effective, and a wall along the carriage-drive facing north-west, is decked with purple-leaved Japanese Maple alternating with Golden Queen

a top dressing of artificial manure is put on. The ingredients are purchased separately, and mixed in the proportions recommended by Ville, which have been already given in these columns. To the liberal and skilful treatment thus afforded, much of the success is to be attributed. Peaches, Nectarines, and Plums, are also largely grown in lean-to houses, and bear very good crops.

The conservatory is a bright house with large specimens of *Acacia Riceana*, and *Tacsonia Van Volkemii*, *Lapageria alba*, and *L. rosea*, which growing together are most effective.

One thing which strikes the visitor, of whom there are many during the summer months, is the neatness and order which prevailed all over the place. Nature has done much to make the place attractive, but art has probably done more.

F. V. D.

NEW OR NOTEWORTHY PLANTS.

BULBOPHYLLUM O'BRIENIANUM, Rolfe,
n. sp.*

COMPARATIVELY few *Bulbophyllums* have flowers large enough and handsome enough to enable them to become popular garden plants, though a few

with dark reddish-purple on a pale ground. It is a member of the *Sarcopodium* group, and will stand next to *B. psittacoglossum*, Rehb. f., which, however, has smaller, striped flowers, broader leaves, and other differences. It is a native of some part of the Himalayas, and was received with *Pholidota repens*, Rolfe, certain *Cœlogynes*, and other Orchids, by Mr. Jas. O'Brien, of Harrow-on-the-Hill, Middlesex. At present, a single plant only is known, and the exact locality remains to be discovered, so that it may remain scarce for the present. It is certainly handsome. *R. A. Rolfe*.

CATTLEYA BATALINI, Sander and Kränzlín.*

This addition to our stock of *Cattleyas* is not only a very beautiful plant, but a very striking one, on account of its affinities. At first sight its form recalls to my mind a small flowering *C. Schilleriana*, the colour that of *C. superba*, the enormous column of *C. bicolor*. There are besides some affinities to *C. granulosa* and *C. guttata*, but they are not so much developed as to lessen the resemblance it has to the first-named species, inasmuch as there is nothing to remind one of the leopard-like colour of those last-named species.

The flowers are fully 2½ inches across, the sepals pale purplish-rose coloured, the petals broader and somewhat darker, the short side-lobes of the lip whitish, with a very faint purplish hue; the middle

FIG. 53. — APPLE, LADY SUDELEY. (SEE P. 333.)

Holly, also trained against the wall. The rich colouring of the former in this position is remarkable, and it would, no doubt, be a useful plant for low terrace walls behind flower-beds.

Standard-trained Apples are planted by the outbuildings, the branches being trained on the roofs; the stems, in some cases, are in front of windows, and vary from 5 to 10 feet in height. From these roof-trees fine samples are obtained, Peasgood's Nonsuch weighing 20 oz., were gathered last year. The system has proved so successful, that it is being extended.

GLASS HOUSES.

The vineries are a particular feature. They have been planted for sixteen years with Black Hamburgh, Alicante, Lady Downes, and Muscat of Alexandria, all bearing good crops, but especially the last-named were so; most of the bunches are 18 inches long, and well shouldered. The borders are all inside, 2 feet deep, with a foot of rubble underneath. Every time the borders are watered

species find a home in most collections of any extent. The present species is an exceptionally fine one, and wherever *Bulbophyllums* are grown it should find a place. It is quite a small plant, as the accompanying description will show, yet the single flower is nearly 2 inches in diameter, and densely covered

* *Bulbophyllum O'Brienianum*, n. sp. — Rhizome stout. Pseudobulbs approx. mate, ovoid, or ovoid-oblong, 1–1½ inch long, 1-leaved, the old ones clothed with a network of persistent fibres. Leaf shortly petiolate, oblong, subacute, 2½ inches long, by 9 lines broad. Flowers solitary from base of pseudobulb, large, its pedicel 1½ inch long, with two or three short broad sheaths at base. Dorsal sepal ovate, obtuse, concave, nearly 1 in. long, by ½ inch broad; the lateral pair similar, but a little broader, oblique, and obtusely carinate. Petals ovate, obtuse, 7 lines long, by over 4 lines broad. Lip strongly recurved, very fleshy, linear-oblong, acute, with a pair of acute keels extending from base to near apex; margin recurved, ½ inch long. Column 2½ lines long, by as broad, angles acute, teeth very small, foot ½ inch long. Sepals and petals honey-coloured, inclining to pale yellow towards base, covered with numerous dark reddish-purple spots; lip very dark maroon purple, except the under-side which is straw-coloured; column light yellow, foot densely spotted, and towards apex suffused with purple-brown; anther-case straw-colour, with a large fleshy apiculus. Native of some part of the Himalayas.

lobe is broader and cuneate, but not in such a remarkable way as in *C. Schilleriana*. In the disc there are two lines of small granular tubercles, but they are very smooth on the surface, and not so much developed as in some other species of this group. The colour of the mid-lobe is deep purplish, with a whitish border. The column is, for the dimensions of the flower, of an enormous size, it being nearly two-thirds of the size of the entire lip, and fills out the hollow made by the side-lobes.

* *Cattleya Batalini*, Sander and Krauzliu. — Affinis *C. Schilleriana*, Rehb. Sepalo dorsali late hocari acuto apiculato, lateralibus falcatis, lineari-lanceolatis acutis apiculatis; petalis cuneato-oblongis obtusatis; labelli lobis lateralibus semiovatis antice rotundatis vix dimidium totius labelli æquantibus, lobo intermedio cuneato dilatato antice alte sinuato margine crispulo, disco lineis 2 elevatis additisque minoribus utriusque instructo; gynostemio pro floribus magnitudine maximo curvato lobis labelli lateralibus tertia parte longiora infra profunde excavato, fovea stigmatica maxima. Pseudobulbi caulescentes ad 15 pollices alti vix ½ pollicem diametro. Folia e basi cuneata ovato-oblonga acuta ad 7 pollicem longa, ad 2½ pollicem lata. Floret media æstate. Flores pallide purpurei 2 ad 2½ pollices diametro, petala rotensis colorata, labelli lobi laterales albidii roseo-suffusi, lobo intermedio violaceo albomarginato.

Botanists who regard natural hybrids with enthusiasm may regard this plant as a hybrid between one or the other of the species named above. So far as one can judge from the results hitherto of cross-fertilisation, the result of fertilising *C. bicolor*, Lind., with the pollen of *C. Schilleriana*, Rchb., may, perhaps, produce a plant similar to ours, and surely a good new hybrid will be the result. But until I

honour of Professor Batalin, the Director of the Imperial Botanic Gardens at St. Petersburg. *Dr. Kronslin.*

APPLES AT MAIDEN ERLEIGH.

In taking some of the highest prizes for Apples at the Earl's Court Fruit Show last month, Mr.

the kingdom a better crop, or finer samples; indeed, the best counterpart to this crop that I have seen outside of a nursery was at Mr. J. Walker's fruit farm at Ham last year. The soil at Maiden Erleigh is far from being an ideal one for Apples. It is a stiff cold clay that needs an immense deal of hard work and of high cultivation to be put into it before it can be made friable

FIG. 54.—APPLE, LANE'S PRINCE ALBERT. (SEE P. 334.)

have a real proof of its hybrid nature, I must regard *C. Batalini* as a new and distinct species, although intermediate between, and very near to *C. Schilleriana*, *bicolor*, *Aelandic*, and others, all of which may have been derived from a common ancestor.

The plant was imported from Brazil by Messrs. Sander & Co., St. Albans, flowered in July of this year, and was exhibited at the meeting of the Royal Horticultural Society, July 12, in the Drill Hall, James Street, Westminster. It is named in

Tarton, Mr. John Hargreave's gardener at Maiden Erleigh, near Reading, gave some evidence not only of the abundance of his crop, but admirable samples of these fruits he has at home. His success, too, at the great Apple display at the Guildhall last autumn afforded sufficient evidence that he could grow Apples well. A visit to the Maiden Erleigh gardens recently, afforded even more conclusive proof of that ability, for I very much doubt whether there is to be seen in any private kitchen garden in

and workable. The trees, with the exception of some standards in the orchard, are all on the Paradise stock, and it is evident that in strong soil this stock is capable of producing fine trees. Every tree in the two large kitchen gardens is planted in rows beside the paths. Those in the older garden have been planted some fifteen years; those in the newer garden from four to eight years. Some of the older trees show in a marked degree that the capacities of the Paradise as an enduring stock are

limited; some are already giving out, and appear to be spent. Some will very soon follow suit, whilst other varieties exhibit considerable strength and robustness, but are still less fruitful than formerly, and Mr. Turton inclines to the opinion that it is wise not to look for enduring trees on the Paradise, but to plant some young trees every two or three years, and grub out those that exhibit evidences of exhaustion, canker, or non-fruitfulness. That is, he thinks, a more satisfactory plan than peddling with attempts to renovate by grafting, or similar means, at renovating when trees are grown as his are in ungenial soil, and in kitchen gardens. The heaviest crops this year are undoubtedly found on the trees that have been the more recently planted, especially some four to eight years. All are somewhat free bushes, not too hard-pruned, and having ample room. That is far better practice, than is crowding the trees, compelling restrictive pruning, which again renders severe root-pruning needful. That excellent cultivator, Mr. Walker, gives his trees full play, prunes very lightly indeed, thins the branches only when needed, and thus secures splendid crops and fine samples. Of the kitchen sorts the finest early one, perhaps, is as usual, Lord Suffield, still the trees of this variety of the oldest planted seem to have done their best; on the other hand that splendid round, handsome variety, Frogmore Prolific, which in Mr. Turton's estimation is better than Stirling Castle, is not only a wonderful and most regular cropper, but the trees full of stout starchy growth, look as if they would endure for many years. Warner's King, is finely fruiting; it is one of the best known of all the large-fruited section, the trees doing well—the same may be said of its types, D. T. Fish and Barker's Seedling, this latter being at Maiden Erleigh a favourite selection. Small's Admirable, like to a large firm Hawthornden, fruits abundantly, this sample was excellent. Alfriston is good too, but of two trees growing near each other, one is a very dwarfed restricted tree on the French Paradise; the other, on the English Paradise, is doubly large, and carries a fine crop; both, however, have large clean fruits. Saltmarsh's Queen is very fine and handsome, and is always a good bearer. This is one of the best average large Apples we have in cultivation. Schoolmaster has medium-sized fruit, very clean and handsome, that keeps well; the growth is stout and clean. Mère de Ménage has a loose thin habit of growth, but fruits freely; they carry good colour. It is not one of the best of keeping Apples, however, but its colour helps to sell it when marketed on a large scale. Ecklinville Seedling here, as so often on stiff soils, whilst having fine fruits, shows spot on them that derogates from their beauty; it fruits early and freely. Blenheim Pippin is represented here either by a diverse strain from that sometimes seen, or else the stock and soil serves to reduce the size of the fruit from what is ordinarily seen on old trees on the Crab stock. None the less the crop is a good one, the fruits very clean and handsome; the sample is a capital dessert size, and having regard to its table excellence, the variety is more useful for the dessert than it is in the kitchen. Grenadier is a favourite variety also, and strongly recommended for market, &c.; the fruits are large, flattish, and abundantly produced. Peasgood's Nonsuch has grand samples; finer and handsomer from bush trees outdoors are seldom seen. This is a somewhat loose-growing tree, but the beauty of the fruit brings some compensation; of course, apart from that recommendation it is regarded as one of the best varieties. Stirling Castle crops heavily, as elsewhere, but the tree is not enduring at Maiden Erleigh; the sample, however, is a fine clean one. Waltham Abbey Seedling ranks here as amongst the very best kitchen sorts. The trees simply need thinning; they crop heavily and regularly; the fruits are fine, and handsome, and keep well till March, cooking admirably. The old Dutch Codlin is fine, but soon falls. New Hawthornden has a grand crop; that, too, is a splendid variety; it fruits here so freely that little strong wood-growth is made. The sample is a fine clean one. Potts' Seedling fruits as freely as Stirling Castle, and does not make

strong growth. Cox's Pomooa, and Cobbett's Fall Pippin, or Reinette Blanche, are both fine, having good crops. Galloway Pippin has a heavy crop of clean, handsome, medium-sized fruits, of good quality, that keeps well; it is not so well known as many others are, but looks a very useful variety. New Northern Greening is good; so is Annie Elizabeth, a shy bearer when young, but does well as older trees. Bramley's Seedling is very fine and free; so, too, is Bismarck, the finest-coloured variety, perhaps, that we have in large fruit. Niton House is a fine free bearer, almost as much so as Stirling Castle, but it is a late keeper. Rhymer is good; so, too, is Manx Codlin, the Apple of the year. In market gardens, Wellington and Golden Noble are cropping finely on standards; so also is the New Hawthornden. Baumann's Red Reinette, as elsewhere, colours finely. Stone's Pippin or Loddington, is found to be better on the Crab stock than on the Paradise.

Asked to name twelve selected kitchen Apples for general good qualities and for a long season, Mr. Turton gave Lord Suffield, Frogmore Prolific, Warner's King, Peasgood's Nonsuch, Saltmarsh's Queen, New Hawthornden, Waltham Abbey Seedling, Golden Noble, Beauty of Kent—very fine here, Lane's Prince Albert, Bramley's Seedling, and New Northern Greening, as a selection that will give fruits for use from the first of August to the end of May at least.

Turning now to dessert varieties, these are, perhaps, less numerous, as one-half of the kitchen sorts have not been referred to. Still, they are many. Of the early kinds some few are already past usefulness, and it is well for those who grow Apples to make of these first earlies a very limited selection. Mr. Gladstone, which fruits well, is one of the best first earlies. Beauty of Bath has not yet fruited fully, neither has Lady Sudeley, which makes sturdy growth. Irish Peach does well, and fruits abundantly. So also does the beautiful Duchess Favourite, and the not less beautiful Worcester Pearmain. A very soft pleasing early Apple is Cardinal, something in the way of Duchess of Oldenburg, but less coloured, more sweet, and earlier; this is a handsome round fruit, somewhat striped, red, and a delightful variety for old people, as its flesh is soft and sweet; it is a good bearer, and does well here. Copeman's is another nice early variety, rich red colour. Cherry Pippin is very good indeed, so to is Court Pendu Plat, but it is worthy of note that, whilst blooming late, it is not fruiting more abundantly than are early-flowering varieties; this variety gives the best colour here on standards. Claygate Pearmain is excellent. A very taking Apple is King Harry, the fruits not unlike those of Lemon Pippin, the skins turning a beautiful golden colour, and mottled red; it is ready in October, and has excellent flavour. Duchess of Oldenburg is, as almost everywhere, very free, and the samples handsome. Strawberry Apple, very rich coloured and conical, should have been referred to with the earliest section. Practically, we have enough and to spare of August and early September varieties; they are so fugitive in quality, that very few should be grown, and those only of the best; their chief use seems to be to make dishes at late summer shows. Margil is very good, especially on standard trees; and Fearn's Pippin not only crops heavily on standards, but colours handsomely. That comparatively tender Apple, American Mother, is here doing well, fruiting freely, and carrying fine form and colour. Of course, Cox's Orange Pippin is good; so too is the good old Cackle Pippin, and also that most excellent keeper, Rosemary Russet. King of the Pippins has a very fine crop on espaliers; so too has Adams' Pearmain, similarly trained.

There are other varieties too numerous specially to mention. Of dessert varieties, Mr. Turton gives the following dozen as his selection from local experience:—Mr. Gladstone, perhaps the earliest of all; Irish Peach, one of the best earlies; Cardinal, Worcester Pearmain, King Harry, King of the Pippins, Cox's Orange Pippin, Blenheim Pippin, Braddick's Nonpareil, Scarlet Nonpareil, Rosemary

Russet, and Cackle's Pippin. The selection still leaves out many good varieties, but all cannot be squeezed into a dozen. Very few first early varieties are named, as these have such very short seasons. A. D. [In illustration of these notes we supply figures of several of the best kinds, figs. 53 to 56.]

ORCHID NOTES AND GLEANINGS.

ONCIDIUM MACRANTHUM.

This is a magnificent Orchid, as anyone knows who has grown it to perfection; to achieve the best results, the plant must be grown on till quite strong before allowing it to flower. I have sent with this note a photograph of a specimen plant, a flowering spike, bearing upwards of sixty perfectly-developed flowers. The photograph fails to do justice to the plant, but it will convey some idea as to the dimensions of the flower spike. The treatment I afford is as follows: the plant is potted in a mixture of good lumpy peat, sphagnum moss, crocks, or charcoal, and as potting proceeds, a good quantity of silver sand is strewn over these. A moderate amount of shade is afforded during bright weather, and a plentiful supply of rain water in the growing season. Now is the time to re-pot or top-dress any plants requiring attention. I grow it in a temperature of about 50° during the winter months, but during the summer, it succeeds best in the Odontoglossum-house. *Herbert May, The Gardens, Markree Castle, Collooney, Ireland.*

ZYGOPETALUM LINDENI.

The flowers of this species, which was shown at the Royal Horticultural Society on June 7 last, are about 4 inches in diameter in each direction. Segments lanceolate, white; lip three-lobed, side lobes small, front lobe large, rounded, wavy, with radiating purple lines on the disc. *Lindenia, t. 337.*

GRAMMANGIS ELLISII.

This is a plant better known as Grammatophyllum Ellisii. It has dense conical, leafy, many-flowered spikes, each flower about 2½ inches across; segments oblong, acute, with numerous reddish-purple spots on a yellow ground. The lip is of the same size as the segments, three-lobed, lateral lobes obtuse, mid lobe triangular, revolute at the apex, provided with a prominent ridge ending in three points, and with numerous projecting plates. *Lindenia, t. 338.*

ZYGOPETALUM GRAMMIFOLIUM.

Sepals and petals light green, heavily blotched with dark brown. Lip of a uniform purple-blue, with a very large horse-shoe shaped crest near the base. *Lindenia, t. 339.*

DENDROBIUM NOBILE COOKSONIANUM.

A variety in which the lateral petals are blotched like the lip. *Lindenia, t. 340.*

VARIEGATED FERNS.

PTERIS Victoriae, an introduction from the Eastern Archipelago, which was distributed by Mr. W. Bull, of Chelsea, a little more than a year ago, is a most elegant little Fern. The basal fronds are broad, and cover the surface of the pot, and the fertile ones grow erect; they are pinnate, with some of the pinnae again pinnately divided near the base. The bright fresh green surface is relieved by a pure white linear marking, the white marking being much more distinct than in *P. albo-lineata*, or any other variegated form that I am acquainted with. Unfortunately, it is rather delicate. Since its distribution large numbers of seedlings have been raised, some of which are distinct from the parent. Among those raised by Mr. H. B. May three distinct forms have been selected, and these have all been awarded First-class Certificates by the Floral Committee of the Royal Horticultural Society. The most remarkable of these is one which has all the characteristics of *P. tremula*, with a distinct silvery-grey variation. A curious circumstance is that several made their ap-

pearance in the same batch, all being as near identical with one another as possible. The same thing occurred with the other two varieties, *P. reginæ* and *P. reginæ cristata*, the former being a more vigorous form of *P. Victoriae*, having rather broader pinnae, and the variegation running through nearly to the margin of the pinnae; the veins and margin pale green. The crested variety is also well defined, and prettily crested. There are other slight variations among a large batch of seedlings, but the above are the most distinct, and should become general favourites, more especially as they appear to be of more vigorous growth than *P. Victoriae*.

Among other variegated forms, the beautiful *P.*

conditions—yet the soft green, with the silvery-white linear marking, makes it one of the most desirable of our greenhouse Ferns.

Lastrea aristata variegata is a very handsome Fern. The bright deep-green surface is relieved by a distinct band of yellowish-green; the fronds being of good substance makes it a useful Fern for decoration. *Athyrium Garringianum pictum*, though a hardy deciduous Fern, deserves being cultivated under glass, the young fronds being almost as bright and distinct in their variegation as *P. tricolor*. *P. cretica albo-lineata*, and its crested varieties, are also among the most useful. I have several times found very prettily variegated forms of the ordinary

which are irregularly marbled with paler shade, is a very pretty and useful Fern.

By making a good selection of the variegated and other tinted varieties of Ferns, a very bright and pleasing effect may be produced, by what are usually considered a colourless class of plants. *Pteris*.

COLONIAL NOTES.

HONG KONG.

HABENARIA SUSANNE.—This is undoubtedly an extremely fine Orchid, and were it better known in England, it would be as much sought after

FIG. 55.—LODDINGTON OR STONE'S APPLE. (SEE P. 334.)

tricolor is a gem which is rarely seen in its best form, although it is not difficult to manage. If potted in a good porous compost, and grown in a moderate stove temperature, it will succeed well, an important point being to avoid damp settling on the fronds, for, should the sun strike the fronds while they are damp, it will discolour them. *P. nemoralis variegata* is another pretty variegated Fern, especially in a young state; and as seedlings may be easily obtained, it is never worth while to keep old plants. At first sight this somewhat resembles the popular *Pteris argyrea*, but it does not grow so large, and is erect in growth; the young fronds are also tinted with red, while *P. argyrea* does not show the slightest tint under any

P. serrulata, the pinnae being striped crosswise with irregular stripes, but these have never proved constant; they either have grown out, or have gradually got whiter until there has not been enough green to sustain growth, and consequently the plants have dwindled away. I have seen variegated forms of *Cyrtomium falcatum*, but not decided enough to be worth perpetuating.

Adiantum macrophyllum is well known for the beautiful rosy tint of the young fronds. The variegation consists of irregular stripes through the pinnae; this is not constant, but I have seen some very well marked specimens. *Gymnogramma japonica variegata*, the broad bright green pinnae of

as *Phalaenopsis amabilis*. It is found growing on the sides of hills, where it finds abundance of root and atmospheric moisture during the summer season, though in our dry winter months it gets only an occasional shower. The flowers are pure white, 3 inches across, and have a strong Gardenia-like perfume. The labellum is 3-lobed, the two lateral lobes being deeply fringed, and thus giving a characteristic appearance to the flower. Bentham, in the *Flora Hongkongensis*, describes the petals as about as long as the sepals, viz., 1½ inch, but in all the specimens I have seen they were only one-third of that length. The spur is sickle-shaped, and from 4 to 5 inches long. It is at its best in

July, and the flowers are borne in threes on leafy stems about 3 feet high.

GLEICHENIA EXCELSA.

This is to be met with on moist, shady, nearly perpendicular banks, where it grows luxuriantly. Its rhizomes creep for a considerable distance, and patches of it 30 or 40 feet square present an imposing appearance. The stipe is several times dichotomously branched, and the pinnæ are from 3 to 4 feet long, and from 12 to 15 inches across at their greatest width. *Gleichenia dichotoma* is the only other species found in the island, but it has nothing of the beauty of the preceding about it. It grows all over the hills in sun and shade, but it always does best in partial shade. The pinnæ are about 1 foot long, and 1 or 2 inches wide. It is the most common Fern, and perhaps the plant most frequently found in Hong Kong.

MELASTOMA MACROCARPON.

Melastomaceæ have a good representative in this plant, for when in flower, which is in July and August, it forms quite a feature of the hillside vegetation. It is an erect shrub from 5 to 10 feet high, and the flowers, which are produced at the ends of the branches, are 3 or 4 inches in diameter. They vary in colour, from nearly white to dark purple, and though, individually, they only last for a few days in perfection, there is such a succession of flowers, that the plant is an object of interest for several weeks. It seeds readily, and young plants are to be met with in abundance.

SPATHOGLOTTIS FORTUNEI.

Although we cannot boast of a field of Cowslips, we have something nearly as good in the way of this Orchid. During July and August, thousands of the plants may be found in flower on the tops of the hills, growing amongst long grass in the full sun. The flowers are rather more than 1 inch across, and they vary from two or three, to twelve or fifteen on a scape about 2 feet high. The leaves are grass-like, and are rather shorter than the scapes. It may be seen flowering at Kew about September.

THYSANOLENA ACARIFERA.

Fine clumps of this, when in flower, remind one of the Pampas-grass. The long, loose, semi-drooping panicles are borne on strong, erect, leafy stems 8 or 10 feet high, and are of a dark purple colour. It flowers in March, and remains in perfection, with our heavy rains, for two or three months. Moist ravines are its habitat, although it is occasionally found doing remarkably well on old stone walls. If it could be proved to be hardy, it would be a great acquisition to English pleasure grounds. *W. J. Tutcher, Botanic Garden, Hong Kong.*

PRUNUS PISSARDI.

Referring to your correspondents, Messrs. Shuttleworth & Co., p. 311, I have just read in *Floralia* that, in the garden of Mr. H. J. Oosting, at Assen, *Prunus Pissardi* carried five fruits this year. They did not state whether the fruit is eatable, but so far as the editor of the *Floralia* knows, this is the first and only case. *J. K. Budde, Curator, Botanic Gardens, Utrecht.* [We have seen fruits on several occasions. Ed.]

SMALL HOLDINGS ACT, 1892.

(55 & 56 VICT. c. 31.)

We extract the following particulars from a circular recently issued by the Board of Agriculture:—

"The Act is divided into three parts. Part I. relates to the provision of small holdings by county councils; Part II. to loans by county councils to tenants purchasing small holdings; whilst Part III. contains certain supplemental provisions.

PART I.—Appointment of Committee and Consideration of Petitions.—In conformity with section 5 (1) of the Act, the county council are required to appoint a committee to consider whether the circumstances of the county justify the council in putting into operation Part I. of the Act.

To this committee is to be referred any petition which any one or more county electors may present to the council alleging that there is a demand for small holdings in the county, and praying that Part I. of the Act may be put in operation, and if the committee are satisfied that the petition is presented in good faith and on reasonable grounds, they are forthwith to cause an inquiry into the circumstances to be made, and they are to report the result to the council [section 5 (2)].

Definition of Small Holdings.—For the purposes of the Act, the expression 'small holding' is defined [section 1 (2)] to mean land acquired by a council under the powers and for the purposes of the Act, and which exceeds one acre and either does not exceed 50 acres, or, if exceeding 50 acres, is of an annual value for the purposes of the income tax not exceeding £50.

Purchase and Hire of Land by County Council.—If the county council are of opinion that there is such a demand for small holdings in their county as justifies them in putting into operation Part I. of the Act, the council may [section 1 (1)], subject to the provisions of the Act, acquire any suitable land for the purpose of providing small holdings for persons who desire to buy and will themselves cultivate the holdings.

Adaptation of Land and Erection of Buildings.—The county council may, if they think fit, before sale or letting, adapt for small holdings any land acquired under the Act, by dividing and fencing it, making occupation roads, and executing any other works, such as works for the provision of drainage or water-supply, which can in the opinion of the council be more economically and efficiently executed for the land as a whole [section 3 (2)].

The county council may also [section 3 (3)] if they think fit, as part of the agreement for the sale or letting of a small holding, adapt the land for a small holding by erecting thereon such buildings, or making such adaptations of existing buildings, as in their opinion are required for the due occupation of the holding, and cannot be made by the purchaser or tenant.

Where any right of grazing, sheepwalk, or other similar right is attached to land acquired by a county council for the purposes of small holdings, the council may [section 14] attach any share of the right to any small holding in such manner and subject to such regulations as they think expedient.

Sale and Letting of Small Holdings.—The county council are to apportion the total cost of the acquisition of the land, and of any adaptation thereof, among the several holdings, in such manner as seems just; and subject to the provisions as to the letting of small holdings contained in the Act, the county council are to offer the small holdings for sale in accordance with the rules to be made by them under the provisions of section 7 of the Act [section 4 (1)].

Where the county council are of opinion that any persons desirous of themselves cultivating small holdings are unable to buy on the terms fixed by the Act, or where the land has been hired by the council on lease or otherwise, the council may [section 4 (2)], in the case of any small holding which either does not exceed 15 acres in extent, or if exceeding 15 acres is of the annual value for the purpose of the income tax not exceeding £15, instead of offering it for sale, offer to let it in accordance with rules to be made by the county council under the provisions of section 7 of the Act.

Section 4 (2) of the Act empowers a tenant of any small holding, before the expiration of his tenancy, to remove any fruit and other trees and bushes planted or acquired by him for which he has no claim for compensation, and to remove any toolhouse, shed, greenhouse, fowlhouse, or pigsty, built or acquired by him for which he has no claim for compensation.

Section 4 (3) empowers a county council to sell, or, in the case of small holdings which may be let, to let one or more small holdings to a number of persons working on a co-operative system, provided such system be approved by the county council.

A small holding may be sold subject to such rights of way or other rights for the benefit of other small holdings as the council consider necessary or expedient [section 6 (7)].

Provision and Repayment of Purchase Money.—The purchase money for each small holding sold by the county council is to include [section 6 (1)] the costs of the registration of the title of the purchaser, but is not to include any expense incurred by the purchaser for legal or other advice or assistance.

A purchaser is required [section 6 (2)] to complete the purchase within such time, not less than one month after the purchase, as is fixed by rules to be made by the county council under the provisions of section 7 of the Act, and on such completion he is to pay [section 6 (3)] not less than one-fifth of the purchase money.

After taking into account the original cost of the land, the expenses, if any, incurred in its adaptation under section 3 (2) and (3) of the Act, and any other expense, including the legal expenses of the county council and the costs of the registration of the purchaser's title, incurred by the council in relation to the land, the purchase money is fixed by the council at, say, £500.

- (1.) Not less than one-fifth of the purchase money, *i.e.*, in the case put, £100, is to be paid in cash.
- (2.) Not more than one-fourth, *i.e.*, in the case put, £125, may be secured by a perpetual rentcharge if the county council think fit.
- (3.) The residue may be repaid either by equal half-yearly instalments of principal, with interest on the outstanding balance whatever it may be, or by a terminable annuity, payable half-yearly, to include both principal and interest. Assuming the rate of interest agreed on with the council to be 4 per cent., and the term of repayment 50 years, the purchaser would, if the residue were £275, pay, under the first of the two alternative modes of repayment, £2 15s. capital, and £5 10s. interest at the end of the first half-year, £2 15s. capital, and £5 8s. 11 $\frac{1}{2}$ d. interest at the end of the second half-year, and so on throughout the whole period of fifty years, the interest being gradually reduced; whilst under the second of the two alternative modes of repayment he would pay at the end of each half-year throughout the whole period of fifty years, on the basis of Archer's Tables, the sum of £6 7s. 7 $\frac{1}{2}$ d.

Conditions under which Small Holdings are to be Sold.—Section 9 provides that every small holding sold by a county council under the Act shall for a term of twenty years from the date of the sale, and thereafter so long as any part of the purchase money remains unpaid, be held subject to the following conditions:—

- (a.) That any periodical payments due in respect of the purchase money shall be duly made;
- (b.) That the holding shall not be divided, subdivided, assigned, let, or sub-let, without the consent of the county council;
- (c.) That the holding shall be cultivated by the owner or occupier as the case may be, and shall not be used for any purpose other than agriculture;
- (d.) That not more than one dwelling-house shall be erected on the holding;
- (e.) That any dwelling-house erected on the holding shall comply with such requirements as the county council may impose for securing healthiness and freedom from overcrowding;
- (f.) That no dwelling-house or building on the holding shall be used for the sale of intoxicating liquors;
- (g.) In the case of any holding on which, in the opinion of the county council, a dwelling-house ought not to be erected, that no dwelling-house shall be erected on the holding without the consent of the county council.

Sale of Small Holdings where Conditions are Broken, or where Sub-division would take Place.—If any of the conditions under which a small holding is sold should be broken, the council may, after giving the owner an opportunity of remedying the breach, if it is capable of remedy, cause the holding to be sold [section 9 (2)].

If on the decease of the owner while the holding is subject to any of the above conditions, the holding would, by reason of any devise, bequest, intestacy, or otherwise become sub-divided, the council may require the holding to be sold within twelve months after such decease to some one person, and if default is made in so selling the holding, the council may cause the holding to be sold [section 9 (3)].

The proceeds of the sale are to be applied in discharge of any unpaid purchase money for the holding or in the redemption of any rentcharge or terminable annuity which is not to continue a charge on the holding, and, subject as aforesaid, are to be paid to

with an absolute title under the Land Transfer Act, 1875. The form in which they are to proceed will be prescribed by rules under that Act, as already mentioned.

User of Land after Cessation of Restrictive Conditions.—If at any time after the restrictive conditions imposed by the Act have ceased to attach to a small holding, the owner of the holding desires to use the holding for purposes other than agriculture, he is required [section 11] before so doing, whether the holding is situate within a town or built upon or not, to offer the holding for sale, first to the county council from whom the holding was purchased, next to the person or persons (if any) then entitled to the lands from which the holding was originally severed, and then to the person or persons whose lands immediately adjoin the holding. Sections 127 to 130 of the Lands Clauses Consolidation Act, 1845, which refer to the course to be taken where superfluous land has been acquired for the

these provisions, unless the council are satisfied that the title to the holding is good, that the sale is made in good faith, and that the price is reasonable [section 17 (3)].

PART III.—Restrictions affecting County Councils.—A county council are [section 18 (1)] not to acquire land under the Act save at such price that, in the opinion of the council, all expenses incurred by them in relation to the land will be recouped out of the purchase money for the land sold by the council, or, in the case of land let, out of the rent, and the council are to fix the purchase money or rent at such reasonable amount as will, in their opinion, guard them against loss.

Borrowing Powers and Expenses.—A county council may [section 19 (1)] borrow money for the purposes of the Act in accordance with the Local Government Act, 1888, except that any money so borrowed is, notwithstanding anything in that Act, to be repaid within such period not exceeding 50 years, as

FIG. 50.—APPLE, PEASGOOD'S MONSIEUR (SEE P. 333)

the person appearing to the council to be entitled to receive the same [section 9 (5)].

Conditions under which Small Holdings are to be Let.—Every small holding let by a county council under the Act is to be held [section 9 (7)] subject to the conditions on which it would be held if it were sold, except so far as those conditions relate to the purchase money; and if any such condition or any term of the letting is broken, the council may, after giving the tenant an opportunity of remedying the breach, if it is capable of remedy, determine the tenancy.

Saving for Local Bye-Laws.—Nothing in or done under section 9 of the Act is to derogate from the effect of any building or sanitary bye-laws for the time being in force. Consequently, the requirements of the county council under sub-section (1) (e) of the section must be such as will not be inconsistent with the bye-laws in force in the sanitary district in which the house is situate.

Registration of Title.—When a county council have purchased land under the Act, they are [section 10 (1)] to apply at the Land Registry Office, for their registration as 'proprietors thereof

purposes of any public undertaking, are to apply, in such cases, as if the owner of the small holding were the promoter of the undertaking, and the holding were superfluous lands within the meaning of those sections.

PART II.—Loans by County Councils to Tenants purchasing Small Holdings.—Under section 17 (1) of the Act, where the tenant of a small holding has agreed with his landlord for the purchase of the holding, the county council of the county in which the holding or any part of it is situate may, if they think fit, advance to the tenant on the security of the holding an amount not exceeding four-fifths of the purchase money thereof.

The provisions of the Act with respect to the purchase money secured by a charge on a small holding sold by a county council, and with respect to any small holding so sold are [section 17 (2)] to apply to an advance made and a holding purchased as above, as if the advance was the purchase money, save that the county council are not to guarantee the title of the purchaser of the holding.

No advance is to be made by a county council to the tenant of a small holding, in conformity with

the council, with the consent of the Local Government Board, determine in each case.

The Public Works Loan Commissioners are empowered [section 19 (2)], in manner provided by the Public Works Loans Act, 1875, to lend any money which may be borrowed by a county council for the purposes of the Act.

Every loan by the Public Works Loan Commissioners in pursuance of the Act is to bear such rate of interest not less than £3 2s. 6d. per cent. per annum, as the Treasury may authorise as being in their opinion sufficient to enable such loans to be made without loss to the Exchequer [section 19 (3)].

Definitions.—For the purposes of the Act—

The expressions 'agriculture' and 'cultivation' are [section 20] to include horticulture and the use of land for any purpose of husbandry, inclusive of the keeping or breeding of live stock, poultry, or bees, and the growth of fruit, vegetables, and the like; and

The expression 'county' is to mean the area under the authority of a county council.

In the Act, and in the enactments incorporated with the Act, the expression 'land' is to include any right or easement in or over land.

The Board earnestly hope that experience of the practical working of the Act may show that it has been successful in accomplishing the object with which it has been sanctioned by Parliament, and that by its means the acquisition of land in small holdings by those who are able to cultivate them with advantage may be facilitated."

PIERRE SONNERAT.

(1745—1814).

COMMERSON'S disciple, Pierre Sonnerat, was destined to eclipse his less fortunate master in fame, happily living to see his work abroad appreciated at home. Born under the monarchy, in 1745, and brought up at Lyons, with a cultivated taste for natural history, and endowed with great skill as a draughtsman, young Sonnerat, when twenty-three years of age, obtained employment under the Government in the colonial and marine department. His relative, Pierre Poivre, having been appointed Intendant at the Isle of France, obtained for his protégé a situation in that colony, and in 1768, the zealous naturalist left Paris for the southern hemisphere. Commerson, who had remained in the Mascarene Islands, after accompanying the expedition of Bougainville, speedily recognised the abilities of Sonnerat, who attached himself to him, and worked cordially in his company for three years in Mauritius, Bourbon, and Madagascar, rich fields, hitherto unexplored by scientific botanists.

Poivre had previously despatched an expedition to the Moluccas, with instructions to collect and bring back to the French colony all possible varieties of economical plants, especially those which bore spices, with some partial success. In 1771, he determined to send another expedition for the same purpose. It was composed of the frigate (*Alte*) "Ile de France," commanded by the Chevalier de Coëtivi, and the corvette "Nécessaire," under Captain Cordé. Sonnerat was attached to the first of these ships, in which he visited, first the Seychelles Archipelago,* where he particularly obtained specimens and drawings of the famous *Coco-de-Mer*,† *Lodoicea Seychellarum* (the first exact published representations of which were due to his pencil); and next proceeded to Manilla, Sambouangan, Mindanao, and Yolo, in the Philippine Islands. The expedition proceeded thence to Patani and Pulo-Gheby, islands inhabited by the Papuans, where they collected and embarked a considerable number of plants and seeds of the Nutmeg (*Myristica*) and Clove (*Caryophyllus*), with which cargo Captains Coëtivi and Cordé returned to the Isle of France, where Sonnerat was enabled to propagate his young plants successfully in M. Poivre's gardens at Pamplemousses and Rôduit. [It may here be noted that the Cloves which Poivre had previously introduced, and which were in charge of M. Córó, first bore fruit in October, 1775.] Sonnerat returned in 1774, after the death of Commerson, to France, bringing back with him a remarkably fine collection of natural history specimens, which he deposited in the Royal Museum (cabinet du Roi). He set out again for the East Indies the same year with rank of naval commissary, and was commissioned by the French Government to continue his researches in those regions. He explored Ceylon and the Malabar coast, Mahé, and the Ghauts mountains; then traversing the coast up to Surat, he went in this direction as far as the Gulf of Cambay. The indefatigable traveller then visited the coast-line of Coromandel and the Sunderbunds at the mouths of the Ganges, proceeding on to Malacca and China. Thence he returned to the Coromandel littoral, and for two years travelled in the provinces of the Carnatic, Tanjore and Madura; but war breaking out with England, in 1778, Sonnerat

was shut up with the French forces under de Bellecombe at Pondichéry, where he was placed in charge of the hospitals and stores during the siege, which lasted forty days. After the capitulation of this place to the British, under Sir Hector Munro, the gallant naturalist was enabled to return, *vidé* the Isle of France, Madagascar, and the Cape, to France, where he busied himself for some time in preparing for publication the volumes of his travels. Whilst abroad, he had already printed his first book (*Voyage à la Nouvelle Guinée, dans lequel on trouve la Description des lieux, des Observations Physiques et Morales, et des détails relatifs à l'Histoire Naturelle dans le règne animal et le règne végétal.*—Paris, 1776). He dedicated this volume to Madame Poivre, to whom he was related. Although the title-page of these travels bears the name of New Guinea, Sonnerat had not actually landed on the mainland of that continental island. Sonnerat only reached Pulo-Gheby, a small islet situated several minutes of latitude to the north of the equator near the south-west coast of Gilolo. This book contains some curious and interesting details of Manilla, the Philippines, Yolo, Pulo-Gheby, and the Moluccas. This volume also contains the illustration of the *Coco-de-Mer* as above-mentioned. Sonnerat now published his better-known *Voyage to the East Indies* (*II. Voyage aux Indes Orientales et à la Chine, fait par ordre du Roi depuis, 1774, jusqu'en 1781, Paris, 1782, 2 vols., 4to, illustrated with a large number of natural history plates.* Among these may be enumerated as interesting to the readers of the *Gardeners' Chronicle*, the following original drawings and descriptions of plants, then first exactly delineated and made known to scientific botanists in Europe, *viz.*:—*Ravenala madagascariensis*, Linn.; *Ravensara aromatica*, Linn.; *Cadamba jasmiaiflora*, Linn. (the famous arbor triste); *Litchi chinensis* or *Euphoria sinensis*, Jussieu; *Cookia punctata*, afterwards named *Sonneratia punctata* by Linnæus; in honour of Sonnerat; *Uvaria longifolia*, Linn.; *Sterculia foetida*, Linn.; *Bombax gossypium*, Linn.; *Tambourissa quadrifida*, Linn.; *Banisteria tetraptera* or *Gærtneria indica*, Linn.; *Amonum repens*, Linn.; *Amonum angustifolium*, Linn.; *Grewia asiatica*, Linn.; *Marsania buxifolia*, Linn. (so named after the Princess de Marsan, the governess of the children of Louis XV.); *Cristaria coccinea*, Linn.; *Piper betel*, Linn., &c. *Capt. S. Pasfield Oliver, Moray House, Stokes Bay, Gosport, August 5.*

(To be continued.)

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

THE MEXICAN HOUSE.—The flower-spikes of the varieties of *Lælia anceps* are now showing in numbers; but the white varieties are shy than the type, and rarely flower till the pseudobulbs have got strong and of the largest size. Having arrived at this stage, however, the production of spikes is not difficult if the culture is good, and the treatment pursued in this house differing only from that of the Cattleya-house in the absence of shading. In order to balance the temperature, and prevent the sun from too much burning the foliage of the plants, a more liberal supply of air, and consequently more moisture in the air are required, the evaporation of moisture being very great. The *Lælia anceps* alba varieties should be kept near the roof, and if they are in pots, the arrangement should be such that they are not further than 3 feet away from the glass; but they are best grown in pans or baskets, and hung up to the roof, and the transfer from pots may be done with safety now as soon as the young pseudobulbs are finished growing, or it may be deferred to early spring. Why I suggest the autumn as the season for transferring the plants is, that they then frequently push out new roots in profusion, which continue to grow throughout the winter, and by the spring these roots have attained a good length, which often causes re-potting to be necessary at that season, which is apt to be irksome. The compost suitable for these *Lælia*s is sphagnum moss and fibrous peat in about equal parts, and when re-potting or re-basketing the plants, the leading pseudobulbs

should be so placed that they will grow towards the centre, and be self-supporting, and not to the sides. The plants, when treated in this manner, thrive better than if they were over-potted or loose in the compost. I would not recommend shifting at this date any of the plants that are carrying flower-spikes, this in their case being best done in the spring. Other short-bulbed varieties, as *L. albida*, *L. autumnalis*, *L. Gouldiana*, *L. furfuracea*, are now forming flower-spikes, and the plants should be kept clean and free from a small species of scale, which attack the young tender leaves sometimes. It is best to discontinue the general syringing the plants overhead at this season, and only doing it in the morning, when appearances are those of a bright day, otherwise the damping-off of the flower-spikes is to be feared.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

FREESIAS.—These beautiful Cape bulba have become very popular of late years, and when we take into consideration the ease with which they may be grown, and their general usefulness as cut flowers, and for the decoration of the greenhouse, it is not a matter of much wonder. To have a succession of flowering plants during the winter and spring, the bulbs should be potted at different times, and the first batch of bulbs should be potted forthwith, and the second lot towards the end of the present month, and some still later, about the end of October. A compost consisting of two parts rich loam and one each of leaf-mould and decayed cow-manure, with sufficient silver-sand added to keep the whole porous, will be found suitable. Place four or five bulba in a 48-sized pot or in a 32, covering them to the depth of half-an-inch with fine soil, and placing them in a cold frame and watering them. No more water should be afforded if it can be avoided till the bulbs have started and grown 2 or 3 inches in length. Remove them to a shelf near the glass in an intermediate-house, and when the pots are fairly well filled with roots, weak manure-water may be afforded sometimes.

POLIANTHES TUBEROSA (TUBEROSES).—The required number of these bulbs should be purchased forthwith, potting them up in successive batches, in accordance with the requirements of the family. Pot them either singly in 5-inch pots, or place four bulbs in an 8-inch pot. The pots should be well drained, and a good compost for them will consist of three parts rich fibrous loam, one of leaf-soil, with the addition of a little decayed manure, and some small quantity of silver-sand. Those intended to flower early should be plunged in a bed with a bottom-heat of 70° to 75°, so as to encourage the production of roots, and no water should be afforded them before top-growth begins, unless the soil should become very dry, when just sufficient should be afforded to prevent the shrivelling of the bulbs. Keep them near the glass at all times after growth has commenced.

HARD-WOODED PLANTS.—Now that we are past the middle of September, the houses, &c., must be got ready for these plants by having the woodwork and glass cleaned and the walls whitewashed, as after the present date it will not be safe generally to trust anything of a tender nature outside longer, unless precautions are taken to ward off frost by means of moveable frames fitted with oiled canvas, reed mats, &c., when the plants may be left outside for a fortnight longer. The tenderness of these, *Adenandras*, *Leschenaultias*, *Callistemons*, *Epacris*, *Tetrateucas*, *Boronia*, *Hedaromas*, &c., should be first housed, but the *Acacias*, *Genistas*, *Azaleas*, *Eugenias*, and *Pittosporums* may be left outside until the first week in October. Examine the plants minutely, to see that they are free from thrips and red spider. Although these insects will not increase to any great extent during the winter, as soon as the warm days of spring return they will speedily increase, and cause a good deal of labour in eradicating them from the plants. These plants should occupy a greenhouse or cool span pit, where they may be brought well up to the roof, and obtain all available sunlight. Strong growing hard-wooded plants which have completed their top-growth, will still continue to make fresh roots, which makes it necessary to guard against the plants becoming too dry at the roots, and thus check root-action.

PLUMBAGO CAPENSIS AND P. ALBA.—These are attractive plants, which bloom during the late summer, when greenhouse flowering subjects are not too plentiful, which make them so much more

* *En route*, an island was discovered on July 1, in lat. 7° 6' S., long 56° 16' E., which bears the name of its discoverer.

† See ante, *Gardeners' Chronicle*, May 21, 1892. Discovery of the *Coco-de-Mer* by Barré in 1769.

valuable. They grow well when planted out in borders, and trained loosely to the rafters or pillars of the greenhouse; and treated in this manner, they attain to a larger size than is the case if they are grown in pots. Now that the flowering season is past, the current year's growths may be cut back quite three-fourths of their length, any neglect of this causing the plants soon to become bare and leggy. Before cutting them in, like all other plants when a large portion of the top is removed, water should be withheld for a few days, so as to allow the soil to become somewhat dry, a moderately dry condition being also advisable till signs of growth are again observed. These remarks will apply to pot-grown specimens, but young plants which have not filled their allotted space should not be much pruned in.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

THE BEDS.—The recent fine weather has improved the appearance of the beds of all kinds. *Lilium auratum*, *L. a. macranthum*, *L. a. rubro-vittatum*, *L. a. pictum*, *L. speciosum rubrum*, *L. rubrum album*, *L. tigrinum*, and *L. t. flore-pleno* are now, as they have been for some time past, in fine flower, in the mixed borders; and *Fuchsias*, pyramids of *Pelargoniums* *Souvenir de Charles Turner*, *Madame Crouse*, and *Jeanne d'Arc*, together with like trained plants of *Calceolaria amplexicaulis*, *Heliotropes*, *Petunias*, *Plumbago capensis*, &c., are now as gay as they have been at any time during the season. These subjects are grown here in pots sunk in the turf in appropriate places; plants, similarly trained, of *Acacia lophantha* and *Abutilon Thomsonianum*, *Solanum marginatum*, *Melianthus major*, and the golden-striped *Maize* intermixed, are also so disposed, or they are planted in beds with a carpet of *Violas*, either blue or yellow, or *Mesembryanthemum*, with an edging of some bright plant. There are nooks in most gardens that could be rendered beautiful in this manner. In order to prolong the flowering of any plants, all spent-flowers and seed-pods should be kept picked off. *Fuchsias* are likely to be extensively used in the flower garden, and they are showy and graceful. I refer to them now, so that those who may intend to employ them next year, may get up a stock of them this season.

ROSES.—Standard and own-root *Roses* are flowering freely, and the blooms are large and solid; those specially good being *Duke of Wellington*, *Duke of Edinburgh*, *William Bull*, *Jules Margottin*, *Alfred Colombe*, *Boule de Neige*, *Gloire de Dijon*, and *Souvenir de la Malmaison*; the latter, one of the best autumn *Roses* that we possess. Now that the nights are colder, the young shoots of some varieties of *Roses* are sure to be attacked by mildew, and the usual remedy, flowers-of-sulphur, should be applied forthwith, while the leaves are damp in the early morning. There are other remedies for mildew to be found in trade lists.

BEDDING PLANTS of a tender nature should be placed under protection in pits or frames, fully exposing them during fine days. Tender plants should be put on a shelf near the glass in a hot-water pit, or some other suitable place, in which the minimum temperature is not lower than 55° or 60°. Examine the plants frequently to ascertain if water be needed, i.e., if the soil is moderately dry.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

STRAWBERRY BEDS, ETC.—All plants intended to fruit next year should be kept free from runners, and the beds from weeds, the hoe being frequently passed between the rows. On light land, early mulching should be applied, and water must be supplied in quantity, should the soil be dry. If the plants of this season's planting are not kept in a growing state, the chance of a heavy crop next season will be a poor one. Late-layered runners, or those dibbled a few inches apart into nursery beds, should, if well rooted and the land at liberty, be planted out where they are to fruit, planting them firmly on ground that has been well prepared for them, watering the plants before lifting them, and again after planting. These plants will not fruit well next year. If the rows are a good distance apart, some early vegetable crops may be taken from the land. Old *Strawberry* beds which may have been neglected should now be put in good order, the bottom leaves, runners, and weeds being removed. If the surface of the ground

is hard, a slight pricking up with a digging-fork will be advisable, and water may be afforded afterwards if the land be dry.

Preparations should be made for top-dressing trees whose fruits were gathered early. Usually this work is deferred till the nailing of the tree is finished, and where slight dressings are required, this does very well; but in the case of trees that have cropped heavily, and are showing signs of exhaustion, heavy dressings are needful to keep up the vigour of the trees, and produce good fruit, and the removal of the surface soil to a depth of 12 inches, raising and pruning back the principal roots that may be bruised. Having done this, afford the soil a good sprinkling of bone-meal, old brick mortar, or burnt earth, and work it into the soil with a fork, watering it through a rose-pot, and cover up with good well-prepared materials, beating them moderately firm, taking care that the soil is rather on the dry side than the reverse, and it can then be made firmer without injury. If it be wet, it should be left awhile before making firm. The trees in hot weather may be syringed overhead, and then the roots will take to the soil before the leaves fall, and while the soil is still warm.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

CABBAGES FOR SPRING CUTTING.—These Cabbages are those kinds which should come into use during April and May, if seed was sown at the proper time. At this part of the season there will be no lack of planting stuff if sowing has been attended to in the manner indicated in earlier *Calendars*, and in view of this, ground should have been prepared. I have not found more suitable quarters for Cabbages than the ground that was occupied by the crop of spring-sown *Onions*, it being usually heavily manured. In such land the plants will make a sturdy growth, short in the stem, and therefore better able to withstand severe frost than other plants which may have made rapid growth. The firmer the ground is, especially if it be of a light nature, the firmer the Cabbage tissues, and the less likely are the plants to bolt. If freshly-dug ground be planted it should, if light, be well trodden previous to planting. Cabbages may be planted much closer together than is often done; and I would advise the planting of the small hearting varieties as *Ellam's Early* (and this variety is one of the best), at 12 inches between the rows, and 9 inches from plant to plant. This saves much ground, and one is not afraid to cut the larger plants early in the year, thus allowing space for the later ones. If the plants stand thickly in the seed beds, do not allow them so to remain, but prick them out into lines a few inches apart if ground cannot be spared for at once planting them. These will lift with plenty of root towards the end of the present month. If this vegetable is required in large quantities, a large piece of ground should be prepared, the plants being pricked-off at the present time into lines. These pricked-off plants winter well, and come in useful for filling the lines early in the year.

CELERY.—The early *Celery* will require earthing-up, and advantage should be taken of dry days to perform the operation, previously affording the rows liquid-manure, or dressing them with some kind of fertiliser, as fish-manure, following this with a watering, the plants being allowed to get dry before the moulding-up is begun. Salt and soot are good fertilisers. During rains, *Celery* with a large top-growth often suffers for want of moisture at the root, the heavy crown of leaves throwing off much of the rain, so that occasional supplies of liquid-manure or water become necessary to prevent running and bad flavour.

CARDOONS will require abundance of water and liquid-manure, and the flavour of the stalks will be improved if salt or fish-manure be afforded. All loose leaves should be removed, and a stout tie given to keep the others together. A portion of the crop may be blanched if required early, twisting hay-bands round the stalks when the foliage is quite dry, and well banking-up the plants with soil afterwards.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

STRAWBERRIES IN POTS.—These should be examined, and imperfect drainage rectified; worms obtaining ingress to the pots at this season, and closing the hole at the bottom, quickly souring the

soil. When rich soil gets into this condition, the plants either die or fail to ripen their crowns. Plants affected in this way should be supplied with clear lime-water after the drainage has been cleared. Guard against crowding the plants, and let every plant stand clear of its neighbour, and continue the removal of runners. Weakly subjects may be fed with well-diluted farmyard manure water; but those which are growing strongly will need have but a pinch of superphosphate of lime evenly distributed over the surface of the soil. The pots being now well filled with roots, an unsparing supply of water on warm days is needed. Discontinue the use of the syringe, as the night dews are now sufficiently heavy. Should a period of wet weather set in, it will be found conducive to the well-being of the plants to place frame sashes over the plants, removing them when bright weather returns. With such a cold sunless season as the present, every means should be used to hasten growth and mature it. *Apricot* trees from which the fruit is gathered, should get heavy syringing with soot water in which soft soap has been dissolved to remove dirt and insects. The root-pruning of such trees as are making too strong wood should be attended to forthwith, and transplanting of trees carried out without losing time. In carrying out the latter operation, retain a good ball of soil, which should be taken with the trees, and the syringe should be plied on the foliage till the roots are able to obtain a supply of food equal to the demand.

THE APIARY.

By EXPERT.

RE QUEENING.—In districts where condemned bees are to be had, it is a good plan to save the young queens for re-queening purposes. All skeps that have swarmed, and after-swarms or casts, will contain queens that have been hatched this season. The easiest way to find queens in skeps is by resorting to the process known as bumping, instead of driving. After putting in a little smoke at the entrance, the skep is taken off the stand, held wrong side up, and then bumped on the ground, cornerwise, while being held at an angle of about 45°. This sudden jerk or bump has the effect of loosening or breaking the combs close to where they are attached to the straw, so that they can then be lifted out almost as easily as from a frame hive. If one or two of the central combs are taken out first, the queen will generally be found upon one or the other of them, when she should be captured and put into a match-box, together with a few workers, to keep her supplied with food. To introduce the queen, it is a good plan to place the match-box over the stock intended to receive it, after the old queen has been removed, for a few hours or a night, as then it makes it more certain that she will be properly received. This is, no doubt, owing to her obtaining in this way the scent peculiar to the hive. A piece of perforated zinc can be placed over the feed-hole, and the match-box opened slightly and laid over it. A home-made introducing cage, constructed of perforated zinc, formed into a tube half an inch in diameter by rolling round a stick, answers very well. It should be about 2½ inches long, the lower part being filled with candy to the height of an inch, made by mixing icing sugar and honey into a stiff paste. The queen is then inserted, and a cork pushed in at the other end keeps her secure; the cage is then ready to be pressed down between the combs in the hive. An examination should be made two or three days afterwards, to find out if the operation has been successful; and if eggs are then found, all will be right.

PAINTING HIVES.—Before the bad weather comes, hives should be puttied and painted, so as to make them water-tight for winter, this especially referring to roofs, which are almost sure to develop cracks and openings during the summer.

THIS SEASON'S RESULTS.—A correspondent (on p. 246), referring to bees having done very badly this year in the North, owing to the unfavourable weather experienced, thinks it would be interesting to know how stocks have stored in the more-favourable South. Speaking from personal observation, it must be considered, on the whole, but a poor season, although in some cases hives that were exceptionally strong in the spring have rendered a good account of themselves. For example, in *Suffolk* over eighty well-filled pound sections were taken from one hive, leaving enough in the brood-frames below to winter on; and in *Essex*, sixty miles distant, 100 lb. have been extracted from the combs of one stock.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see. Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY SEPT. 20. Royal Horticultural Society: Fruit and Floral Committees.

SALES

MONDAY, SEPT. 19. Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms, at 12, Plants from Belgium, Carnations, and Hardy Bulbs, at Protheroe & Morris' Rooms, at 12, Dutch Bulbs at Stevens' Rooms.

TUESDAY, SEPT. 20. Annual Sale of Greenhouse Plants at the Moat Nursery, East Grinstead, by Protheroe & Morris. Great Clearance Sale of Orchids at 213, Park Road, Clapham, by Protheroe & Morris (three days). Dutch Bulbs, at Protheroe & Morris Rooms.

WEDNESDAY, SEPT. 21. Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of Stove and Greenhouse Plants at Owen's Nursery, Maidenhead. Liliums at Stevens' Rooms.

THURSDAY SEPT. 22. Dutch Bulbs at Protheroe & Morris' Rooms. Plants from Belgium and Hardy Bulbs at Protheroe & Morris' Rooms. Lilium and imported and established Orchids at Stevens' Rooms.

FRIDAY SEPT. 23. Great Sale of *Odontoglossum Alexandriae* at Protheroe & Morris' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms.

SATURDAY SEPT. 24. Great Sale of *Odontoglossum Alexandriae* at Protheroe & Morris' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms. Liliums at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—56°·7.

Steam and Hot-water Heating for Greenhouses.

In the *Bulletin*, No. 41, for the month of August of the present year, issued by the Cornell University Agricultural Station, the comparative merits of the above systems of warming horticultural buildings are somewhat exhaustively discussed by Mr. F. W. CARD. The introduction is by Prof. L. H. BAILEY, who states what he thinks should be the best method of arriving at definite results concerning the relative merits of the two systems. He says that to do this "we must consider not only the consumption of coal, but the original cost of the two systems, their adaptation to particular purposes, and the comparative ease with which they can be managed. At the outset of our investigation, we asked ourselves the question, 'where is the heat expended in the two systems?' It is evident that two heating plants which make the same amount of heat, and carry it throughout houses of equal size, may distribute this heat differently, and therefore differ widely in usefulness. We have endeavoured to ascertain how much heat left the heater (boiler), and how much returned to it; how much was expended near the heater; how much escaped from the risers (flow-pipes) as top-heat, and how much from the returns as bottom-heat. These ques-

tions cannot be studied by taking the air temperatures of the houses. In fact air temperatures taken at stated intervals seldom afford a satisfactory measure of the actual conditions of the houses, for they do not show the incidental variations, and they often overlook the temperature at the most critical periods; this fact is well illustrated in the air records of our houses in the following pages, which give the highest average for the hot-water house, although it was actually the coldest. It is apparent that air temperatures are influenced by sun, ventilation, watering, and general management, and they are discontinuous; and they cannot, therefore, be accepted as accurate measures of the heating capacity of any apparatus. It follows that the performances of two systems can be studied nearly as well in houses of different construction as in similar ones, for the house is, to a certain extent, eliminated from the problem and the actual work of the apparatus considered. The heat must be measured in and on the pipes; after it leaves them it is largely beyond our control."

From the above the reader will observe that this method of testing the capacity of boilers, either steam or hot-water, differs greatly from that adopted by our horticultural builders, who seem to be satisfied if they ascertain how much 4-inch piping will be required to heat so many cubic feet of air, and the required size of boiler for the ascertained quantity of pipe. Where these various conditions are fulfilled, gardeners in this country are usually satisfied with the results obtained. Yet it will sometimes occur that owing to glasshouses being built on various levels and at a variety of angles to each other, hot-water circulates badly, every bend or dip in the pipes producing friction and consequent sluggish circulation of the water. In such cases steam forms a better heating medium than water, as no impediments in this form exist to hinder its onward movement, and the heat is almost as great at the most distant point as near the boiler. The houses at Cornell University were rather intricate in arrangement, and used for various purposes, some being warm ones, others cool; but there was no difficulty in maintaining the proper heat in each by means of steam in those in which it was used, and the variations were much less as noted on and in the pipes than was the case with the hot-water pipes.

For example, in the Tomato and Cucumber-houses heated by steam, the average loss of heat in the steam flow pipes in a distance of 60 feet was 4°, whilst in the return pipes near the boiler it averaged 75°.

In the hot-water house it was found that the water left the boiler at an average temperature of 155°, and came back at an average temperature of 122° by the upper return, and 111° by the lower return.

There was an average loss of 13° in passing the 20 feet of the length of the house. The water lost altogether 25°, as compared with 4° to 10° by steam. This shows the superiority of steam for long-distance heating and for bottom-heat purposes.

The proportion of coal consumed in these experiments was as hotwater: steam :: 1: 1·27. But as the houses heated by steam measured about 2500 square feet of surface, and the hot-water heated houses about 1700 square feet, this shows a consumption of about 15 per cent. more coal per 100 square feet of surface heated by the hot-water boiler than by the steam boiler. The general deduction from these experiments was,

that for crooked circuits and long ranges, steam is better than water.

From what we know of the working and management of steam-heating apparatus in a large way, it is necessary to have the best quality of cast-iron piping, which must be at least double the thickness of ordinary hot-water piping, and the joints must be flanged and fastened together with bolts, and furnished with vulcanised india-rubber rings, to prevent the escape of steam. They must have accurately-fitted (turned) expansion pipes placed every 20 or 30 yards apart, to make the apparatus safe; and the boiler must have constant attention the whole time it is in use, a watch being always kept on the pressure-indicator. Another matter which calls for constant attendance is the fact, that it is neither desirable nor safe that steam should be always passing into the pipes. The usual practice is to let in steam for a time, sufficient to highly heat the pipes, and then turn it off, check the fire draught, and let the steam that is then made escape into a condenser or up the chimney shaft until the thermometer in the houses shows that it is necessary to let in more steam. In very cold weather steam has to be let into the pipes at short intervals; and perhaps in very cold climates, as that of the northern United States, steam would have to be constantly made during the night, but during the bright sunny days of that country, even in mid-winter, it would be but little needed about the middle of the day, except in forcing-houses. This would, of course, entail steam being made in a large boiler, to heat, we will say, but a fraction of the whole, although where all the houses had to be kept at high temperatures, that kind of expense would naturally be anticipated.

Usually, when the pressures employed are low, the diameter of the pipes may range from 4½ to 5 inches, but the larger the diameter, the larger must be the steam capacity of the boiler. Even for a small house, the large amount of heat afforded by pipes of large diameter is preferable to the higher pressure and strong dry heat entailed by the use of small malleable iron pipes. For large establishments steam is preferable to water even here, but it should always be controlled and looked after by a skilled engineer, and he should always be provided with a mate.

We cite the general conclusions at which Mr. CARD arrives, which are true under these conditions, although some of them may not be true universally:—

1. The temperatures of steam-pipes averaged higher than those of hot-water pipes, throughout the entire circuit for the entire period of test.

2. The higher the inside temperature in steam-pipes the less is the proportionate warming-power of the pipes at a given point. The heat is distributed over a greater length of pipe, and as steam is ordinarily carried at a higher temperature than hot-water, it has a distinct advantage for heating long runs.

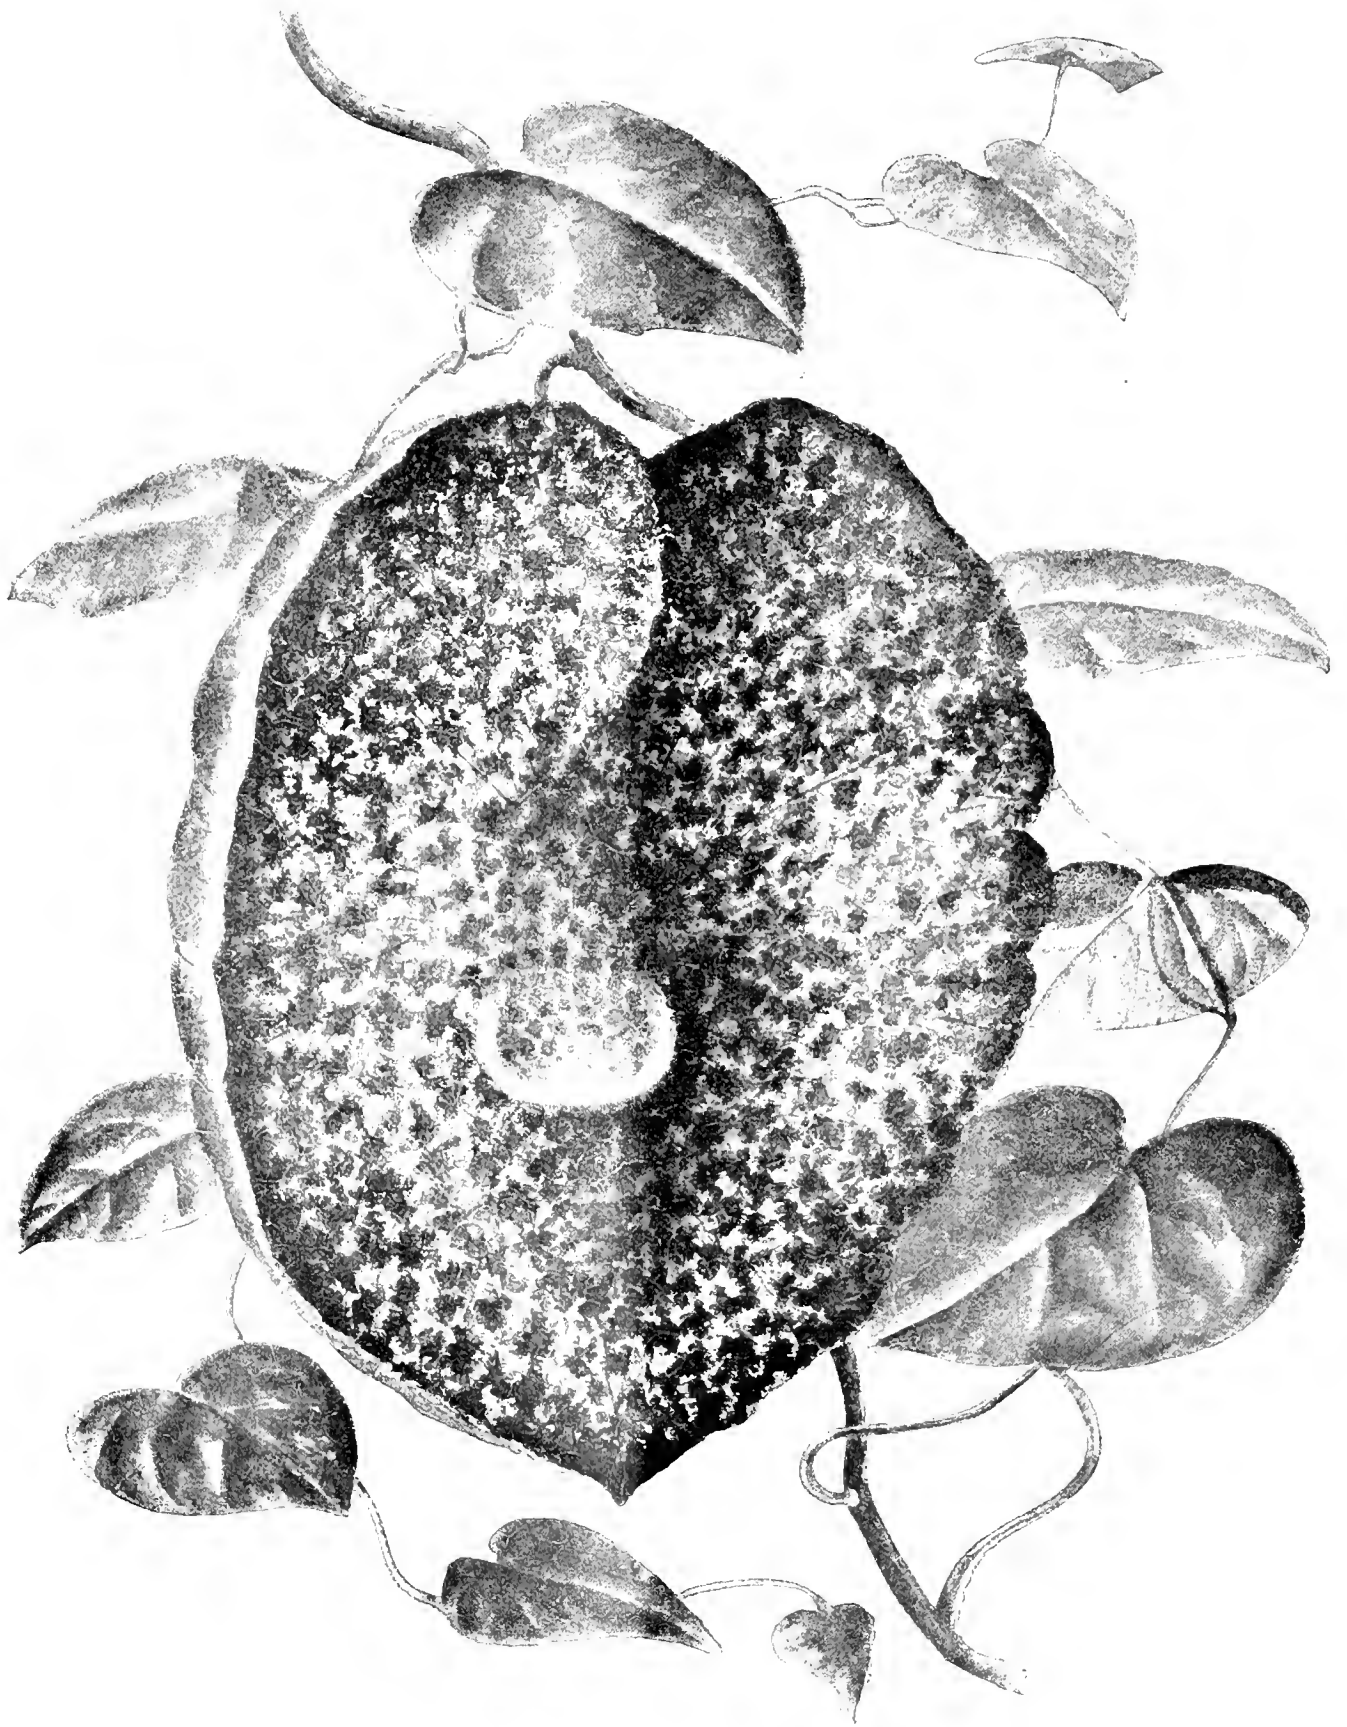

3. When no pressure is indicated by the steam-gauge, the difference between the temperatures of the riser and the return, is greater with steam than with hot-water.

4. Under pressure, the difference is less with steam than with hot-water.

5. There is less loss of heat in the steam risers (flow-pipes) than in the hot-water risers, and this means that more heat, in the steam system, is carried to the farther end of the house, and more is spent in the returns as bottom-heat.

6. This relation is more uniform in the steam-risers than in the hot-water risers, giving much more even results with steam than with hot water.

7. When the fires are operative, the fluctuation in the temperature of the risers at any given point is much greater with hot water than with steam.

ARISTOLOCHIA GIGANTEA (MARTIUS).

Reduced one-half. Colour: cream coloured, with purple spots.

8. An increase in steam-pressure raises the temperature of the entire circuit, but the temperature does not rise uniformly with the pressure.

9. The first application of the pressure increases the temperature of the returns much more than that of the risers.

10. Steam is better than hot water for long and crooked circuits.

11. Pressure is of great utility in increasing the rapidity of circulation of steam, and in forcing it through long circuits and over obstacles.

12. Unfavourable conditions can be more readily overcome with steam than with hot water.

13. Hot water consumed more coal than steam, and was at the same time less efficient. This result would probably be modified in a shorter and straighter circuit, with greater fall.

14. Under the conditions here present, steam is more economical than hot water, and more satisfactory in every way; and this result is not modified to any extent by the style of heaters used."

Incidentally, we may note the fact that the report which has formed the subject of the foregoing comments is of itself founded upon a thesis prepared for a bachelor's degree by Mr. F. W. CARD, who is at present a Fellow in Horticulture." Imagine a student of Oxford, Cambridge, or even London, writing a thesis on steam-boilers for a degree in horticulture.

Our American friends are a long way ahead of us in these matters, and whilst we gardeners are moaning over a low rate of wages, over-abundant supply of gardeners, and inadequate social status, the Americans are extending the bounds of horticultural science, supplying a more thorough education, recognising talent by means of university degrees, and thus while raising the whole standard of efficiency, are elevating the gardener to the position he ought to occupy.

M. L. LINDEN, of the "Horticulture Internationale" of Brussels, has favoured us with dried specimens and an India-ink drawing of an *Aristolochia*, which may well form a pair with the extraordinary *A. gigas*, figured by us at p. 552, November 7, 1891. We had no difficulty in identifying M. LINDEN'S plant with the *Aristolochia gigantea* of MARTIUS and ZUCCARINI.* It is a glabrous climber, with cordate, ovate, acuminate, or somewhat rounded leaves, paler on the under surface, with the distended flower-tube sharply bent back in the middle, and expanded above into a vast oval, mucronate limb, measuring in the dried specimen before us 12 inches in length, 8 inches in breadth (30 cm. long, by 21 cm. lat.), cordate on one side, with two rounded lobes and pointed on the other side. The perianth is destitute of the long tail, which forms so striking a feature in *A. gigas*. We have not seen fresh flowers, but the colour appears to be cream-coloured, flushed with pink on the outside, and thickly spotted with purplish-brown spots on the inner surface, the throat surrounded by a blotch of velvety-blackish purple colour. The plant is found in the Brazilian provinces of Bahia and Minas Geraes.

It is unfortunate that the two species, so much alike in other particulars, should also have names which entail constant confusion, but this cannot now be helped. It may serve to assist the memory to remind the reader that the giant *Aristolochia* (*A. gigas*) has a tail, while the gigantic one (*A. gigantea*) has no such appendage.

A. grandiflora, as pointed out by Mr. HEMSLEY in our columns, November 7, 1891, p. 552, is

* *Aristolochia gigantea*, Martius and Zuccarini, *Nov. Gen. et Sp.*, i. 75, t. 48; Duchartre, in *De Cand. Prodr.*, xv., i. 474; Masters, in *Martius Flora Brasiliensis (Aristolochiaceae)*, p. 89.

another large-flowered form from the West Indies, but its flowers, large though they are, are small by comparison either with the "giant" or with the "gigantic" *Aristolochia*.

Reverting to the giant form at Kew, we note that this is now known as *A. gigas* var. *Sturtevantii*, the approximate dimensions of the perianth being no smaller than 18 inches in width, 22 inches in length, with a tail 34 inches long. One figured in *Garden and Forest* had a flower 12 by 18 inches, and a tail 42 inches long, though the plant now flowering at Kew was originally a cutting from that described and figured in *Garden and Forest*, so that the dimensions of the flower vary within rather wide limits. Mr. WATSON says in the publication just cited that *A. gigas* *Sturtevantii* is readily increased by cuttings from the half-ripened wood.

Other large-flowered species are *A. brasiliensis*, the one most frequently grown; *A. ornithocephala*, *A. hians*, *A. Goldiana*, figured in *Gard. Chron.*, 1867, p. 1143; *A. tricandata*, and *A. longicaudata* (Mast., in *Gard. Chron.*, Nov. 1, 1890, fig. 98, p. 493), and especially *A. promissa* (Mast., in *Gard. Chron.*, April 19, 1879, p. 491), which is or was in the hands of Messrs. VEITCH. Of smaller forms, there are the beautiful *A. elegans*, introduced by Mr. BULL; *A. ridicula*, *A. Duchartrei*, and *A. clypeata*, all of which are worth growing.

NICOTIANA TOMENTOSA, Ruiz et Pavon.—Under this name Sir JOSEPH HOOKER mentions and figures the noble *Nicotiana* introduced into France in 1888 under the name of *N. colossea* (see *Gardeners' Chronicle*, Jan. 17, 1891, p. 84, f. 25; *Revue Horticole*, 1888, p. 511, and 1891, pp. 75 and 290). It appears that the plant was raised from the dust and debris taken from some Orchids imported from Brazil. At Kew it speedily attained a height of 10 feet under glass, and would have grown still taller but for the necessity of topping it. It flowered in April of the present year, the flowers being borne on a loose much-branched panicle. Each flower is about 1½ inch long, pale yellow, flushed with red, and with a tubular five-parted calyx and curved funnel-shaped corolla, with a spreading five-parted limb. The species is a native of Peru, Bolivia, and New Granada. At Saratoga, at a height of 8500 feet, it occurs everywhere in bedges. Sir JOSEPH does not mention its occurrence in Brazil. *Bot. Mag.*, t. 7252.

STEMONA CURTISII.—This is not a plant to excite much enthusiasm in the average horticulturist, but to those of a botanical turn of mind it is very interesting. It is a climbing plant, with leaves like those of a *Dioscorea*, but with red flowers an inch or so in length, arranged in stalked axillary panicles. It is a native of Penang, whence it was sent to Kew by Mr. CURTIS. It belongs to the natural order *Roxburghiaceae*. The drawing shows a perianth of four rose-coloured segments, anthers with long terminal appendages, and a one-celled ovary, with basal or free central placentation.

ABERDEEN PUBLIC PARK.—At a meeting of the Links and Parks Committee of the Aberdeen Town Council on Friday, 9th inst., it was agreed on the motion of the convener, to increase the salaries of Mr. WALKER, head gardener of the Victoria Park, and Mr. HARPER, head gardener of the Duthie Park, to £130 per annum. The estimated expenditure for the upkeep of the Aberdeen public parks for the current year has been fixed at £2160, showing an increase of £278 compared with last year.

A CASE OF POSITIVE GEOTROPISM.—In a *Cliveia nobilis* (*Agaveae*), Herr J. WIENNER has recently recognised what he regards as the first recorded instance of positive geotropism in a flower. The flower appears to be quite regular in the bud, but when fully developed it is monosymmetrical. The movements dependent on growth are very complicated, the principal part being played by a form

of nutation which is not distinguishable from positive geotropism. For further details, consult the *Berichte Deutsch. Bot. Gesellschaft*, v. x. (1892), p. 12

ROYAL HORTICULTURAL SOCIETY.—On Tuesday, September 20, 1892, a flower show will be held in the Drill Hall, James Street, Westminster, when, also, a paper on "The Variation of some Hardy Plants under Cultivation," by the Rev. C. WOLLEY DOD, will be read, at 3 P.M.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual dinner of this Society, as Mr. W. COLLINS, the Secretary, informs us, will take place on Wednesday, October 5, at 6 P.M., at the Cannon Street Hotel; and JOHN FRASER, Esq., of Lea Bridge, will preside.

NOVA SCOTIA: THE APPLE CROP.—The prospect of the fruit grower, according to the Government Crop Report, is not very bright. In districts where fruit is grown for home supply, there appears to be an expectation of nearly an average crop. The two principal counties that send fruit into the general markets are King's and Annapolis. The following summary of their returns are not very promising:—Co. Annapolis: Paradise. Great growth of wood; fruit dropping. Lawrencetown. Below average in quantity and quality. Spa Springs. Average crop. Granville Centre. 85 per cent. of a full crop. Round Hill. Below an average crop.

GHEENT "QUINQUENNIAL".—We have received a copy of the programme of the great exhibition to be held at Ghent next spring. The exhibition will be open from April 16 to 23, 1893, and will, as usual, take place under the auspices of the Royal Agricultural and Botanical Society of Ghent. Amateur and professional horticulturists of all countries are invited to compete, but must give full notice of their intention to do so before March 20. The jury, chosen amongst horticulturists of various nationalities and unconnected with the town of Ghent, will meet on Saturday, April 15, 1893, at 10 A.M. The programme comprises no fewer than 660 classes, including new plants, Orchids, stove plants, Aroids, Palms, Cycads, Ferns, forced shrubs, bulbs, Azaleas, Camellias, Rhododendrons, Agaves, Conifers, and many others. Specimens suitable for botanical instruction, are asked for as well as illustrations of the effects of various manures on the growth of plants, of auto-fecundation, and of cross-breeding respectively, microscopic preparations, myrmecophile plants, plants from the Congo, photographs representing the natural vegetation of different countries, &c. Medals of gold, silver-gilt, and silver, are offered in profusion by the King and Queen, as well as by various societies and individuals. Altogether, the show promises to be of colossal magnitude, and what is much more desirable, of great interest and educational value. The president is the genial and learned Count OSWALD DE KERCHOVE DE DENTERGHEM; the Secretary is M. A. L. ROSSEEL.

CERTIFICATES AT CHISWICK.—Some rather curious questions have turned up as to the powers exercised by the experts appointed by the Royal Horticultural Society to adjudicate upon the merits of the objects exhibited at the ordinary committee meetings in the Drill Hall and at Chiswick respectively. In order that the reader may more readily comprehend the position of affairs, we append a letter of a correspondent:—"What must be regarded as a somewhat novel point of procedure, cropped up at the recent meeting of the Royal Horticultural Society's Fruit Committee. That body, in common with the Floral Committee, is occasionally convened to meet at Chiswick, for the purpose of going over the various flowers, fruits, and vegetables grown there. With the exception that the meetings are held at Chiswick instead of at the Drill Hall, there is no difference in them from the ordinary or fixed meetings. Both are statutory, but the Chiswick meetings cannot be held on fixed dates, as they must of necessity depend upon the times when the various products are at their best. The committees seem so far to have

been under the impression that when they are summoned to Chiswick, they meet armed with the same powers they possess when they meet at the Drill Hall, and have regarded the granting of the highest number of marks to anything at Chiswick as equivalent to Certificates of Merit. That illusion has been dispelled. When at the recent Drill Hall meetings, a dish of a fine new Pea, Veitch's Success, was placed on the table for Certificate by Mr. WYTHES, it was said at once this Pea has been grown at Chiswick, and already had a Certificate, or its equivalent, awarded. To that it was replied, 'No, the committees have no power to grant such Certificates at Chiswick,' and as may be seen by a paragraph in the present year's schedule and programme of arrangements, can only give marks, anything so honoured having to be presented at a subsequent meeting of the committee at the Drill Hall. As that is the dictum of the Council, there was no course open but to grant the Certificate to the Pea, which is a highly meritorious variety; but the strange complications which this sort of thing presents were well evidenced in this case. The Pea was put into commerce by the Messrs. VEITCH. It was sent to Chiswick by Messrs. BARR & SONS, and the Certificate was after all granted to Mr. WYTHES, who had nothing to do with sending the variety to Chiswick. It is thus seen that after one person or firm has sent products to Chiswick for trial, and which there receive a maximum number of marks, it is open to some other person to send samples of the same thing to the Drill Hall, and thus claim the full honour of a Certificate. That certainly could never have been the desire of the Council. The committees naturally hold that being summoned to Chiswick, those attending should be armed with the same powers there that they have at the Drill Hall. That power is denied them. What is to be done? The going to Chiswick usually entails on the members very considerable loss of time, some inconvenience and expense, and under existing arrangements they will hardly care to go there so often as before. I have never seen any regulations as to the numbers needful to form quorums. It is now suggested that each committee shall elect from its body, a Chiswick sub-committee, whose duty for the year it shall be when summoned to Chiswick, to grant marks to certain products, and present a report at the ensuing fixed meeting for adoption, which shall sanction the granting of Certificates to all subjects receiving three marks if not previously certificated. That may solve the difficulty if adopted. It is obvious that persons residing at remote distances cannot send easily samples of these products to the next meeting, and they would be very unjustly handicapped, and such conditions should be withdrawn. If it be agreed that accepting the reports of the sub-committee grants the Certificate, that will solve the difficulty." The above letter raises some important points. In our opinion, the value that attaches to the Chiswick marks is undeniably greater than that pertaining to a certificate awarded at the Drill Hall, and, *pro tanto*, the powers and status of the judges is, or should be, higher. At the ordinary meetings of the committee, the fruit, flower, vegetable, or whatever it may be, is seen only once; judgment, moreover, is in all probability given on a selected sample. It is not likely that the exhibitor would send any but the best specimens he had, and it is possible, for aught the committee know to the contrary, that the bulk of the crop is far inferior to the selected sample shown. At Chiswick it is otherwise; there, the plant is under observation for the whole season; generally a considerable quantity is grown—grown, too, side by side with other varieties of a similar character, so that comparison can readily be made—a comparison rarely possible at the Drill Hall. What we should suggest is, that the committees or sub-committees meet at Chiswick from time to time as they do now; they should record *each time* the judgment they come to on any particular subject; and that at the end of the season they should review the whole of the evidence thus recorded, and then, and not till then, should a Certificate be granted. In this way a "Chiswick

Certificate" would have a value in the eyes of the experts above that attaching to ordinary First-class Certificates, and, we need hardly say greatly exceeding that of the Certificates and prizes, awarded at those shows (and they are the majority) where the awarding of prizes is the predominant object, and prize-winning rather than the advancement of horticulture the most important matter in the eyes of the exhibitor.

STOCK-TAKING: AUGUST.—In the present most unsatisfactory condition of things all over the European continent, in South America, and elsewhere, it is very satisfactory to note that the decline in our exports for the past month amounts in value to only £619,159, as compared with the same period last year; and that the imports exceed those of the same period by some £2,098,086. Prices of food keep low, Wheat being about 29s. per qr. (the reason why, perhaps, the baker and the miller "make hay;" i.e., Wheat having fallen over one-fourth in value, bread is reduced in price one-fourteenth!), tea, cotton, wool have still a downward tendency; so that the manufacturer has a fair inducement to keep at work, though doubtless the speculative merchant has a hard time of it—in fact, it is the masses generally who have the turn just now, and if they have not what may be termed a superabundance of work, they have cheap food and clothing, important factors in the maintenance of health, so sadly wanting in the vast empire of Russia, where famine preceded disease and death. The subjoined table is extracted from the Summary of the imports of foreign and colonial produce in August:—

IMPORTS.	1891.	1892.	Difference.
	£.	£.	£.
Total value for month	£32,746,279	£34,841,365	+2,098,086
§II.—(A.) Articles of food and drink—duty free	11,799,508	14,013,683	+2,214,175
(B.)—do., dutiable	2,113,185	2,017,894	-95,291
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	2,957,157	2,970,521	+13,364
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,436,652	4,621,154	+184,502
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,122,179	1,056,808	-65,371
(B.)—Parcel Post ...	38,761	45,640	+6,879

The subjoined figures relating to the imports of fruits and vegetables will this month be found of special interest to the reader, the "unenumerated"—the unknown—having to a great extent been abolished by the items concerning Plums, Pears, Cherries, and Grapes:—

IMPORTS.	1891.	1892.	Difference.
Fruits, raw.—			
Apples bush	116,763	339,481	+222,718
Cherries "	...	31,356	+31,356
Plums "	...	226,077	+226,077
Pears "	...	272,152	+272,152
Grapes "	...	174,928	+174,928
Unenumerated, "	975,137	164,582	-810,555
Onions "	261,009	355,855	+94,846
Potatoes cwt.	41,716	75,500	+33,784
Vegetables, unenumerated, raw, ... value	£108,928	£143,736	+£34,808

Here it may be noted that Macclesfield—or, rather, its principal industry, the silk manufacture—requires a fillip, or, perhaps, reorganisation; but that is not for us in these pages. However, this reminds us that the Sublime Porte gives promise of being extra sublime in the matter of encouraging the planting and growth of the Mulberry tree. Turkey is very much in need of a

push in the industrial line, and there is every reason to believe that an extended cultivation of the Mulberry would be exceedingly beneficial to the silk trade—hence the Porte has decided to give medals of various degrees of value (gold and silver) to such as excel in the business above noted. We wish the effort all success, as it will tend to lower the chances of the monopoliser. Still, on the subject of silk, the reader may remember hearing some year or two since about an invention brought out in France for "abolishing the silkworm." The inventor proposed from wood-pulp to turn out silk as one would printing paper now-a-days—literally by the mile! The thing fell through, however, and remained quiet until recently, when it was resuscitated, on the strength of the declaration that all difficulties had been overcome and only capital was needed. This has been formed, we understand, entirely by Frenchmen, and from St. Etienne we are instructed the world will be supplied with materials, both raw and manufactured! Possibly the worm may outlive this invention, as the old whale had survived the introduction of gas as a substitute for whale-oil.*

EXPORTS.

As we briefly noticed, these have been almost arrested in their decline—the decrease for the past month being but £619,159 as compared with August, 1891. Doubtless the fear of finding ports closed expedited delivery in very many cases—but we are content to take the fact as it stands, and to hope that we have reached low-water mark.

A HINT FOR COLLECTORS.—A writer in the *Orchidophile* very properly lays great stress on the desirability of collectors drying carefully specimens of the plants they meet with, and of sending them home duly numbered, with indications of the locality where found. Such specimens would serve as guides to the Orchid importer and collector of the future. At present, very probably, the plants arrive dead, and the collector too may often die at his work; the consequence is, his labours are lost to the world, while a single dried specimen with an indication of its habitat would, so far as the plant was concerned, render even such a disaster repairable. The writer further recommends the collector to establish himself in some likely district, and to make himself fully acquainted with its flora before attempting to send home living specimens. He should wait before so doing till the dried specimens have been examined at home, when he could receive exact instructions as to what living specimens should be collected, packed, and sent home.

FLOWERS IN SEASON.—We have before us some beautiful varieties of Violas, sent by Messrs. Donnie & Co., Rothesay, N.B., and Beaulieu, Hants. There is much variety in the colours, and, for the most part, they are selfs. Rothes is an orange-yellow self; Rob Roy, a twice certificated variety, is orange and bronze; Peter Barr is light reddish-purple, with a yellow circular centre, very nice; W. Neil is deep lilac, quite a novel shade; Ravenswood, as befits its name, is an intensely dark purple; Edna is purple and violet; Prince of Orange (new) is deeper in tint than Rothes; Violetta is pure white, save for the faintest shade of blue on the back of the petals; York and Lancaster is not red and white, as in Rosa, but purple, with radiating lines or flakes of white; and Annie King is of the hue of a Neapolitan Violet. These Violas make capital bed and marginal lines, ground-work for taller plants, filling for spring vases, and many other uses.

A PEAR—A PAIR—AND NOT A PEAR.—M. PYNÆRT sends us a "proliferous Pear," showing one Pear growing out of another—and yet there is no Pear. The lower "fruit" is merely a thickened flower-stalk, bearing a calyx at its summit, and from the centre of which projects a second branch like unto the first. There is no core, and no seeds in either. Botanists will appreciate the significance of this monstrosity—pomologists will look askance at it.

* The invention has not been secured by letters patent—its details are kept secret; but an expert has stated his belief that the leaf of the Mulberry is the principal constituent of the "wood pulp."

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—The Floral Committee of this Society on the occasion of its meetings on August 10 and 24, awarded the following First-class Certificates:—To Messrs. E. H. Krelage & Son, Haarlem, for *Gladiolus* hybr. *Nanceianus*, G. A. de la Devansaye, G. W. Watson, G. Professor Lambio, G. Rosamunda, G. Prédistant Chandon, and G. A. Van der Heed; G. hybr. *Lemoinei*, G. J. H. Krelage, G. la France, G. Nué bleu, G. Charles Joly, G. Toison d'Or, G. Telemaque, G. Amiral Gewais, G. Keteleer, G. Vercingetoise, G. Crozy fils, G. l'Esperance, G. Vondel, Nos. 144, 145, 94, and 148. To Mr. J. C. De Lange, Rotterdam, for *Cactus* *Dahlia* Black Prince (new introduction), *Canna* hybr. *Viruly* Verbrugge (new plant); to Mr. Jac. Smits, Naarden, for *Rosa indica* (Thea), R. Papa Gontier (insufficiently-known plant); to Mr. C. G. Van Tubergen, jun., Haarlem, for *Criinum* *Powellii* album (introduced new plant), *Achimenes* *Phœbus* (new plant); to Messrs. Groenewegen & Co., Amsterdam, for *Fuchsia* *Beauty of Exeter* (new plant), *Reseda* *odorata* var. *alba* (new plant), *Centaurea* *cyaneus* fl. pleno; to Messrs. De Graaf Brothers, Leiden, for *Delphinium* *sulphureum* (insufficiently known plant); to Mr. J. Th. Van Den Berg, jun., Jutfaas, for *Gladiolus* hybr. *Nanceianus* No. 121. Second-class Certificates were awarded as follows:—To Messrs. E. H. Krelage & Son, Haarlem, for *Gladiolus* hybr. *Lemoinei*, G. Sophie Buchner, G. Perfection, Nos. 127 and 171; *Montbretia* *crocosmæflora* B.B.; to Mr. J. Th. Van Den Berg, jun., Jutfaas, for *Gladiolus* hybr. *Lemoinei*; to Mr. C. Kuiper, Apeldoorn, for *Fuchsia* hybr. (*Phénomène* × *Frau Emma Töpfer*); to Mr. J. C. De Lange, Rotterdam, for *Dianthus* *Caryophyllus* *Madame* Stepman (new introduction), *Canna* hybr. No. 4 (new plant); to Messrs. Groenewegen & Co., Amsterdam, for *Phalaris* *arundinacea* aur. var. (new plant), *Achillea* *fipendulina* (insufficiently-known plant), *Gaillardia* *maxima* (insufficiently-known plant), *Helenium* *pumilum* (insufficiently-known plant), *Helianthus* *multiflorus* *grandiplenus* (new plant), *U. rigidus* (new plant); to Mr. C. G. Van Tubergeo, jun., Haarlem, for *Lilium* *Wallacei*. Botanical Certificate to Mr. C. G. Van Tubergen, jun., Haarlem, for *Calochortus* *Bonplandianus*, *C. flavus*.

PEDIGREE ONIONS.—The usual annual display and competition of Mr. DEVERILL'S Onions, which have been grown in different parts of the United Kingdom, may be seen at their nursery, Cornhill, Banbury, on Thursday and Friday next, September 15 and 16. The total number of entries amount to 90, and the specimens to 1264.

A FROZEN CHRYSANTHEMUM AT IPSWICH.—One of the visitors present at the Royal Aquarium when the frozen *Chrysanthemums* were examined was Mr. E. HERBERT FISON, of Ipswich, one of the Directors of the Bank of New Zealand in the City. At his urgent request, one of the flowers in its frozen cylinder of ice was presented to him, and taken to Ipswich, and on the next day publicly exhibited at the museum, and visited by about 1000 persons. A public address relative to the experiment was delivered by Dr. TAYLOR, and on the motion of Mr. E. H. FISON a vote of thanks was passed to Mr. JOHN EARLAND of New Zealand for sending the flowers so far, and in such good condition.

KEW.—Of late years, the importance of Kew as a school of horticulture has been enhanced. We here use the word "school" in the same sense that our Continental friends do to signify an example or demonstration. To collect and grow a large number of plants, arranged in botanical sequence, and in gridiron beds, is the function of a botanic garden proper. To arrange them picturesquely, and to demonstrate their fitness for the various phases of decorative gardening, as is done in the rock garden and elsewhere at Kew, is the office of the gardener. It is possible, in a measure, to combine the two requirements, as once was done in the Oxford Botanic Garden. The vast importance of Kew, from a botanical point of view, needs no

insistence. It is this which has raised it above all similar institutions. The general public and the average gardener are, nevertheless, more likely to be attracted by the horticultural aspects of the place, and from this point of view we would counsel all who can do so to lose no time in seeing the re-constructed herbaceous border by the side of the T-range. It is at this time and will be till the frost comes, a mass of bloom. The plants are grown in dense masses, not tied or throttled by stakes; or when such aids are necessary, they are concealed by the vigorous growth of the plants. Tall perennials at the back, those of moderate growth in the centre; and in the foreground dwarfs and annuals, standard *Fuchsias* intermixed here and there among *Phloxes*, *Dahlias*, *Helianthus*, *Tritomas*, *Rudbeckias*, *Asters*, *African* *Marigolds*, *Antirrhinums*, *Senecio* *elegans*, *Begonias*, *Dianthus* *Heddewigii*, *Stocks*, *Verbena* *venosa*. These are only a few of the things that occur to us in the veritable floral patchwork. Herbaceous borders are too often weedy muddles, or disfigured by unhappy plants tied to the stake, with bare patches of soil between the victims. All this is avoided at Kew, and we have no doubt from the experience gained this season the arrangement of colours will be even better next year. Whether the position in proximity to a building is the best that could have been selected, is a matter of opinion. We have seen such beds, and even beds of annuals, placed on the terrace gardens, in proximity to buildings of some architectural pretensions; but such collocation is incongruous. In our opinion, the best of all backgrounds for an herbaceous border is a sinuous belt of evergreen shrubs—but these are matters of taste.

MISS JAMESON.—We have to acknowledge the receipt of the following sums on behalf of this unfortunate lady:—

W. Carruthers, Esq., F.R.S.	£1	1	0
James Britten, Esq.	0	10	6
Geo. Murray, Esq.	0	19	6

in addition to the sum previously mentioned. There must be many Scotch friends of the late Professor JAMESON who would, we imagine, be glad to contribute to the fund.

FRUIT IMPORTS INTO GERMANY.—We glean from *Moller's Deutsche Gärtner Zeitung*, that the imports of fresh and dried fruits are as much a matter for lamentation as on this side of the water. The requirements in these articles is not adequately met by the home producer, and efforts are likely to be soon put forth to rectify what is regarded as a loss of money to the country. In fresh fruits Austria-Hungary heads the list with 379,928 metrical cwt., that is of 100 kilogs. each; then follows Switzerland with 108,710 metrical cwt.; the Netherlands with 40,478 metrical cwt.; Belgium with 22,775 metrical cwt.; and Italy with 19,724 metrical cwt., of which the greater part consists of early Cherries, Oranges, and Nuts. In recent years dessert Apples have reached the country from America in no small quantities. In dried and preserved fruits, Austria leads the way with 168,661 m. cwt.; Serbia following with 27,151 m. cwt. These two countries supply in great part the German requirements in dried Zwetchen (Plums, Prunes). The other countries which supply these dried products are:—America, with Apples; France, with Prunes; the Netherlands, Belgium, and Italy. The imports from Austria, Serbia, America, and Belgium, are constantly increasing.

THE FLORISTS AT WASHINGTON.—The annual meeting of the Society of American Florists at the national capital was, says *Garden and Forest*, more numerously attended than any which preceded it. The report showed that the membership of the Society had increased during the year, and its influence extended in every direction. Mr. WILLIAM R. SMITH, Superintendent of the Botanic Garden in Washington, was elected President for the ensuing year, and Professor TRELEASE, of St. Louis, was made Vice-President, and St. Louis was chosen as the place of meeting for next year, Mr. JOHN

THORPE, the Chief of Floriculture of the Columbian Fair, announced that all the floor-space of the great horticultural building had been already taken up, and that exhibitors from abroad had shown a greater interest than the florists at home, and had already applied for more than half of the space to be disposed of. The trade exhibit was particularly good, and filled the large lower hall of the Armoury, where the Convention was held. Excellent displays of Orchids and other choice plants were made by Messrs. PITCHER & MANDA, of Short Hills, New Jersey, and by Mr. H. A. DREER, of Philadelphia. The display of tuberous *Begonias* by Mr. J. W. ELLIOT, of Pittsburg, was noteworthy, and so was a collection of Cacti by a southern firm.

BOTANY AND HORTICULTURE.—Professor BAILEY makes an appeal in *Science* for a broader field for botany, which has become restricted until it is little more than the science of wild flowers. But now that the doctrine of evolution has added a new purpose to the study of natural objects, cultivated plants are especially valuable for the examples they give of variation, and of the effect of modified environment and selection. The common view that the variations in cultivated plants are anomalous, and therefore uninteresting, is erroneous. But apart from the fascinations which the cultivation of plants has in the direction of science, this cultivation demands the attention of botanists because horticulture ought to be nothing more than the application of the principles of botany. The fact is, that it is quite impossible to separate horticulture and botany by any practical test, and, therefore, a department of botany should comprise laboratories, botanic gardens, greenhouses, orchards, vegetable and ornamental gardens, all maintained for purposes of active investigation rather than as mere collections. Botanists too often care little for gardening, and horticulturists are too often apt to underrate the value of scientific investigation. No man who does not unite scientific knowledge and practical training can appreciate the needs of botany in its broadest sense. No one can be a specialist in all subjects, but the ideal occupant of a chair of botany in the university of the future will have the genius to encourage and direct the work of specialists in every direction, and not until then can the science be actively presented to the student in its fullest possibilities, says *Garden and Forest*.

ROSE EXHIBITION AT THE HAGUE.—In July next year there will be a special Rose exhibition at the Hague in honour of the little Queen of the NETHERLANDS.

OBSERVATIONS ON SUNFLOWERS.—Having discovered that the leaves of the Sunflower, *Helianthus annuus*, are visited by nearly twenty different species of insects, and that some of them, especially the ants (*Myrmica levinodis* and *Lasius niger*), suck the leaves, Gordyaghin was led to suspect the existence of "extra-nuptial" nectarine. Accordingly, a series of experiments were carried out, to ascertain whether drops of nectar do appear on the leaves, and the observations made have confirmed the supposition. An account of these observations is given in a recent issue of the *Memoirs of the Kazan Society of Naturalists*, vol. xxiii.

INSECTICIDES.—We understand that, at the trials of insecticides which took place on the 5th inst., at the International Horticultural Exhibition at Earl's Court, Messrs. CLIBRAN & SON, Oldfield Nurseries, Altrincham, gained the highest award for CAMPBELL'S Fumigating Insecticide, and a First-class Certificate for CAMPBELL'S "Lemon Oil," a well-known preparation for the extirpation of plant insect enemies.

THE NITRIFICATION OF HUMUS.—Humus, the black organic matter of soils, is not readily attacked, it seems, by nitrifying agents. Mons. P. PICHARD has found from a recent investigation of the subject that the nitrification is increased by the addition of chalk and gypsum, which hinder the volatilisation of

the ammonia. These are practical points which are worth making a note of. The gypsum, however, can only be used for dry porous soils. In spite of the slow nitrification of humus, the amount of nitrates formed in sandy soils, poor in lime compounds, would be enough for the needs of growing plants were it not for the washing action of the rain. Mons. PICHARD considers that in order to increase the amount of nitrification in rich humus soils, they should be treated with chalk, a small amount of gypsum, and a little clay, or manured with a compost mixed with gypsum and loam. A paper on this subject may be consulted in the *Comptes Rendus*, cxiv., pp. 490—493.

NEW DISCOVERIES OF ALKALOIDS IN PLANTS.—Chemists are very active just now in exploring the constituents of plants, and especially in searching for those alkaloids which, though for the most part of a highly poisonous character, promise to be of great use in medicine. Amongst the latest discoveries in this direction, we may notice that of glaucine, which has been obtained by J. A. BATTANDIER from the sap of the leaves of *Glacium luteum*; ephedrine from the root of *Ephedra monostachya*, by P. HESSE, and from *Ephedra vulgaris* var. *helvetica* by NAGAI of Tokio; lupanine from *Lupinus angustifolius* by HAGEN, and by A. SOLDANI from *Lupinus albus*; aristine from *Aristolochia argentina*, by O. HESSE; aristolochine from *A. serpentaria*, by CHEVALLIER; pilljanine from *Lycopodium saururus*, by ARATA and CANZONERI. It will be noticed that most of these discoveries are by German chemists.

TUBEROUS BEGONIAS.—The display of these favourites for bedding-out and house-culture is still a very good one at Messrs. J. LAING & SONS, Stanstead Park Nursery, Forest Hill, S.E., as may be imagined, when we inform our readers that the space occupied by the beds exceeds 2½ acres. They are arranged in long beds containing thousands of plants, according to their colours. Here are yellows so closely resembling each other in hue that the effect seen in the mass, is that of one colour only, alongside may be crimson equally well selected as regards tint, height, and average good quality; then scarlet and various shades, pinks, and white, in the choicest variety. The firm is at present striving after a white-flowered variety that shall be purely white on both sides of the petals, and carry its flowers on an erect stalk, which will, if it be done, make an ideal subject for the flower-gardener. One thing at a time is the motto of the firm, and it may be some few years before the aims of the hybridiser are fully realised with this and the other coloured tuberous Begonias. Some of the double-flowered varieties already have stiff stalks, carrying their flowers almost erect, and hopes are held that bedding doubles will take their places as bedders, especially those with erect habit of growth. The houses, filled with plants, in 4, 6, and 8-inch pots, contain some exquisitely coloured examples, with large flowers, both single and double. Should frosts hold off, this remarkable exhibition will remain good for a long time yet.

VIOLAS.

YOUR correspondent, "J. B.," in his notice of "Bedding at Kew," in the *Gardeners' Chronicle* of September 10, alludes to Violas, and instances Countess of Hopetoun as certainly the best white, and he is quite correct; but it not a pure white. It is of close compact habit, and a wonderful and continuous bloomer, and stands any weather. But as a taller grower, filling up larger space, and of a clear white colour, I mention Mrs. McDonald, a pure white, of good habit and constitution, and still in full bloom with me; also Marchioness of Tweeddale, snow-white. Ardwell Gem, is also mentioned as the best yellow. It is certainly an all-round excellent variety, but is of a pale yellow colour; so also is the Queen, another excellent pale yellow, still in full bloom. Bullion stands out prominently as an early and continuous bloomer, of a rich deep yellow

colour, but is not a strong grower, still it is excellent for front rows and small beds; and in "Yellow Boy," a variety known under this name in Birmingham, we have a stronger grower of fine constitution, a very free bloomer, early and continuous, and of a bright yellow colour. "J. B." also mentions True Blue as his foremost favourite blue. It is our best blue, and was raised seven or eight years since, is of close habit, good constitution, very early, free and continuous bloomer, and has more of the blue colour in it than any other Viola. As a taller and more robust grower, Ormonde, of Holyrood style, but a great improvement upon it, and without the bronze-brown blotch, is a valuable variety, of a rich blue-violet colour, and grand in masses or rows.

Mrs. Charles Turner is a dwarf compact-growing variety of a distinct blue-purple shade; a lovely variety in every way. In other colours, William Neil, soft rosy-pink; The Mearns, rich rosy-purple, with light top petals; and Lady Amory, dark violet-purple, with whitish top petals, are all beautiful and very effective. Evelyn, synonymous with Duchess of Albany, is still a mass of colour here, lilac, tinted lavender, or mauve, and lovely. One variety in particular I must single out as a gem amongst Violas for bedding work, and that is Mrs. Pearce. It is a good grower, of compact erect habit, and a most profuse bloomer; almost white, the top petals flushed with lilac—a true Viola, very early in bloom, and still (early in September) a mass of bloom. Violas this year are flourishing, and will be more in demand than ever.

Out of the host of varieties now in cultivation a large number can be selected as lovely garden plants, but for beds and masses of a colour a few bright and distinct colours only are wanted. In planting a bed of mixed Violas care should be taken to ascertain which are the freest and tallest growers, which should be in the interior of the bed. Some, such as Mrs. Grant, Sir Joseph Terry, Hugh Ainslie, and others, are of short compact habit, and should be in the front, and planted closer together than the others.

As an old grower, I strongly recommend early autumn planting in firm and not over-rich soil. I have seen a large number of late spring-planted Violas die off this year as well as in previous years, and for early prolonged blooming and durability of the plants, autumn planting, or, if in the spring not later than the middle of April, should be done. But with autumn planting, and with a mild spring, borders and beds are gay with Violas from the end of March onwards. *W. Dean, Sparkhill, Birmingham.*

HARDY PLANTS IN MR. BENARY'S NURSERY AT ERFURT.

ONE has no idea of the great beauty of many garden annuals until they are seen in large beds and borders cultivated to produce seeds—the common Cornflower, for instance, *Centaurea cyanus*, is not only pretty in the mass, but excellent as a decorative plant to produce cut flowers for vases, &c. The ordinary blue variety is the best, but rose colours of various shades, and white varieties are also produced from seeds. I noted a very pretty dwarf form planted in large beds, producing compact masses of bloom, the plants growing to an average height of 6 inches only, whereas, the ordinary form will grow 2 feet high or more.

There are some long beds fully in flower of *Brachycome iberidifolia*—the blue and white varieties in separate beds at some little distance from each other. This pretty plant is well-named the Swan River Daisy. It flowers most profusely in beds or borders, and as seen here in beds, 30 or 40 feet in length, the effect is very striking. It may be treated in England as a half-hardy annual, the seeds to be sown in a hot-bed in the spring, and to be first pricked-out in boxes, and ultimately planted-out in good soil. It can also be sown in the open border in April, and will then flower later than the planted-out lot.

Some large beds were filled with *Lobelia ramosa*, which had an excellent effect. The plants grow

from 1 foot to 15 inches in height, producing erect stems, well furnished with bright blue or pure white flowers, the varieties being kept in separate beds. This is a distinct garden plant, and should not be confounded with *L. fulgens*, to which species *L. ramosa* has sometimes been referred. As a garden plant, both forms of this *Lobelia* should be freely grown.

The common Larkspur (*Delphinium Ajacis*) seems more open to improvement under good culture than any other annual. Mr. Benary grows an immense number of them in colours. The demand for seed must be very great, if one may judge from the large number of plants grown here. Large quarters in the open fields are set apart for each colour; the best type seemed to be The Emperor Larkspur. The plants were tall, and furnished with immense branching spikes, the colours being of the most varied kind; there are pure white varieties, rose of various shades, blue and purple, from pale blue to rich deep purple-blue, carmine, tricolor varieties, &c.

The trade in Pansy seed is very large, and, as in the other classes of seed, much pains is taken to improve the stock. The system of the firm from the first has been to mark certain plants that produce flowers of superior form, substance of the petals, or distinct colours, and to mark them to produce seeds for home sowing. Large numbers of women were engaged picking the seed-pods from the Pansies before they burst and scatter the seeds. It is easy to judge of the trade in this particular flower when it is stated that the seed is sold by the hundred-weight. As some evidence of the fine climate in this part of Germany in the autumn, the Carnations are grown in the open fields to produce seed, the second and third quality only, the first quality being grown under glass in the home nursery. As an old Carnation grower, I was greatly interested in all the processes of seed-saving of these flowers. One would think that everybody would purchase first quality seed, the difference of even a shilling in the price of a packet being very unimportant in comparison to the trouble of growing plants for two years, or, at least, for two seasons, before the flowers are produced; and when it is known that the first quality is produced from named varieties grown under glass, and the second and third quality from seedlings in the open fields, it really does seem absurd to hesitate about the difference in price of the seeds.

Much care is taken with the second-quality seed. The seed is taken from a named or selected variety; a certain number of plants being raised from this seed are planted in a bed by themselves with the parent-plant in one corner; a large number of beds are planted, with a different seed parent in each, and it is very interesting to observe the variations from the same parent. This is to be expected, as each seed pod may have a different pollen parent; and the colour of the flowers seems to be more influenced by the pollen than by the seed parent. No single-flowered plants were to be seen amongst the seedlings, and the selfs, bizarres, flakes, and fancies were very distinct and pretty. From this class of plants the second-quality seed is saved, and a few of the best of them are layered and transferred to the first-class section for next season. The second-quality seed is sown to produce the third quality for next year; but no seed is saved from single varieties, indeed, none were to be seen in the seed grounds.

While dealing with the Carnations, it may be well to remark upon the method adopted to supply the first-quality seed. A photograph of the glass-covered erection put up to accommodate 18,000 plants, growing singly in 7-inch pots, was taken by Mr. Nigel M. Smith, and the woodcut (fig. 57) taken from this affords a better idea of it than could be done by any descriptive remarks. The arrangement is very simple and effective. There is a substantial wooden framework, span-roofed in form; the glass lights throw off the rains, the sides and ends are open to the weather. Such an array of plants, well-cultivated, in full blossom, form an excellent display, taken as a whole, and a minute examination of the flowers is a delightful experience to the Carnation fancier, who has long been accustomed to the flakes

bizarres, and Picotees of English gardens and Carnation exhibitions. The flower stems are fastened to neat sticks by rings an inch in diameter cut through at one point, the two cut ends of the rings being pressed into the sticks in opposite directions enclosing the stems. Three rings are needed for tall stems, two for shorter ones.

There does not appear to be in use in Germany any well-defined standard of excellence such as the florists have set up in England, to classify the colour and markings of the flowers. On the other hand, much importance is attached to their form. Those with broad smooth and well-formed outer petals, contained in a long shapely calyx, are preferred, while seedlings with a bunch of small petals, contained short calyces, likely to burst before the flowers open, are discarded in Germany, as they

ns of "a fine bright pale red colour on the upper side, from the edge to the middle, which mixture is of wonderful great delight." This description might yet apply to some of Mr. Benary's seedlings; some of them are deep purple-red on the upper side, others of such a pale delicate rose colour, that it fades out before the petals decay, leaving a white self.

The culture of Carnations is but a small part of Mr. Benary's business. Choice stove and greenhouse soft-wooded plants are grown extensively for the production of seeds only. Several span-roofed houses are set apart for Gloxinias. One house was filled with a variety possessing rich scarlet flowers; another contained a variety named Emperor Friedrich, crimson-scarlet, with white margin. Defiance, a variety with dark velvety blue-purple flowers, occupied

Tuberous Begonias are also grown in houses set apart for them, and heated; the varieties, both single and double, are up to the average of our English sorts, but Mr. Benary, ever on the search for novelties and improved forms, has now obtained striped varieties, with flowers like a flaked Carnation. An entire large house is filled with the best named Fuchsias laden with flowers; but the object of their culture is the same—seeds! A very wonderful sight was a long lean-to pit filled with well-grown plants of Lisianthus Russellianus. This is a very beautiful greenhouse plant, and should be grown in every garden. It succeeds best treated as a biennial. The seeds should be sown in the summer, and the plants grown on through the winter in pots near the glass roof of a moderately warm house. The thing is to be careful with the water; it is better to water them from the bottom of the flower-pots upwards than from the surface soil downwards. When well managed, single plants will grow large enough to need an 8 or 9-inch pot, and the plants produce a mass of their deep mauve-purple flowers. It is discreditable to us that beautiful garden plants like this are uncommon in gardens merely because they require some pains to grow them well. A frame full of plants of Statice Suwarowi superba, and with it a mass of a beautiful grass, *Stipa elegantissima*, was a sight long to be remembered; the dense branched spikes of rose-coloured flowers upon the Statice were extremely beautiful, and such a contrast to the elegant plumes of the *Stipa*.

I have given a mere sketch of some of the principal features of this large establishment, and if any one idea was impressed on my mind more than another, it was the feeling that as much care and forethought was bestowed upon the smallest details of the work, and that nothing was left undone that would tend to improve the strains of plants grown to produce the seeds, which are distributed (wholesale only) by the firm to every country in the world where people have intelligence to sow seeds, and to cultivate the plants when they get them. *J. Douglas.*

HOME CORRESPONDENCE.

GEM LAWN SWEEPER.—So many gardeners write asking me for particulars of the above machine, that I think it would be best if the makers were to advertise in the *Gardeners' Chronicle*, when, I am sure, orders would soon flow in. I am delighted with it, as when worked by a boy, it does more work, and cleaner, than six men could do with brooms. The machine is a combination of a carpet sweeper and lawn mower, and the price is very moderate. It is manufactured by Schaeffer & Co., of Dayton, O., America. Mr. Don, of Chapel Bar, Nottingham, who sent mine here on trial, is agent for the sale of it in this country. *J. Hamilton, Byrkley Gardens, Barton-on-Trent.*

THREE GOOD GREENHOUSE CLIMBERS.—In the well-kept and extensive corridor connecting the fine range of plant-houses at Falkland Park, Norwood, I observed recently, amongst many other good things, the now seldom-seen *Solanum jasminoides*, perfectly wreathed with its white flowers; the old and well-known *Ecceimocarpus scabra*, likewise flowering profusely; and clusters of *Heliotropium corymbosum*, emitting a pleasing fragrance, that pervaded the whole structure. *J. B.*

FOXGLOVES.—For certain positions, such as the wild garden, shrubbery, borders, or sides of woodland walks, there is nothing in flowering plants better than the Foxgloves, which are not only bold and showy, but they seem to thrive almost anywhere, for whether under the shade of trees, or out in the open, they do almost equally well, and make a display for several weeks in succession. Like nearly every other species of hardy plant, the Foxglove has been very much improved of late years, and the variety known as *D. gloxinoides* has very large blossoms, the bells being long and widely distended, and some are beautifully spotted or marked in the throat. Besides the adaptability of the *Digitalis* for the places referred to, and their exceedingly effective appearance when so situated, they give no trouble after they are once started and established, for, though considered as biennials, they are so free seeding, and so tenacious

FIG. 57.—SHELTER FOR SEEDING CARNATIONS IN MR. BENARY'S NURSERY, ERFURT.
(From a photograph by Mr. NIGEL SMITH.)

ought to be in England. Although the main object of growing the plants is to obtain seeds, Mr. Benary supplies plants, and it may be useful to observe that a grower in England would certainly be disappointed if he applied for flakes and bizarres, expecting to be supplied with types known as such in England. If flakes are wanted, "ribbon" Carnations must be asked for. The yellow ground varieties with red markings or flakes of colour, which in England are termed fancies, are sold in Germany as flakes. The varieties grown are very numerous in every shade of colour, plain selfs of all colours, yellow, red, rose, crimson, scarlet, purple, maroon, white, &c. Flakes and stripes of every colour on white and yellow grounds. Picotees, white and yellow-edged, with many colours, light and heavy; and last but not least, the "Painted Ladies," or "Dainty Ladies" of the old English gardens. Parkinson, in the *Paradisus*, describes Mr. Bradshaw's "Dainty Lady,"

another house; yet another contained a light blue variety with white throat, named *Celestina*. No one need trouble to purchase plants of these varieties, for they come practically true from seeds.

Other houses were set apart for mixed varieties of the *Crassifolia* type, of all shades of colour, and of superb quality. Mr. Benary pointed out what he considers to be quite a new type; they are of the spotted section, but the dark spots are surrounded with white, and are designated the leopardised varieties. Immense quantities of *Petunias*, single and double, are grown in glass shelters, the same as those used for the Carnations in pots. It was interesting to see the process of fertilising the single varieties with the pollen obtained from the double flowers. A double *Petunia* does not bear seeds, but if single varieties are fertilised with the pollen from them, the largest proportion of the seedlings will produce double flowers.

of life and strong of habit, that the plants come up in all directions, hold their own with gross weeds common to, at least, one of the positions mentioned, and tower up with their stately flower stems, and take good care of themselves. With us they have been quite a feature, as we have them in great quantities in our wild gardens, where they are grown in big patches, or bold masses of mixed colours, ranging from purple to pure white, many of the stems being 10 feet or so high, and branching out freely around. In a general way, the seed is ripe about the end of July, when the pods or capsules burst, and it falls, and is distributed or sown naturally; but at the first start, when plants have to be raised, it is better to sow earlier, and so get them strong before planting out. A good plan of treating them is, to prepare a piece of ground on a border, or other part, by raking it fine and level, and having marked the size, or stood a handlight on, sow therein, afterwards just covering the seed, when a sprinkling of water should be given, and the handlight closed, and kept shaded till the seed germinates. As soon as this takes place, of course light is at once necessary, and some air to prevent the seedlings from drawing. The plants, when large enough to handle, should be pricked out, in rich fine soil, in beds, and there left to grow till they are big enough to transfer to the positions assigned them. To give them a fair start there, the ground ought, if poor, to be manured, and deeply dug, as, though so sturdy, *Digitalis*, like most hardy plants, pays for good cultivation. *J. Sheppard*.

LEEKs.—An unblanched Leek is just about as useful and as palatable as is unblanched Celery. When, however, the Leek stems have been properly blanched, it is surprising to find how the whole character of the plant in an edible aspect is changed, and how very nice it is when properly cooked and served. That the Leek constitutes what may be called a popular vegetable is inexact. Relatively very few are grown for market; indeed, it is not certain that in gentlemen's gardens, where they are most grown, there is any great demand, and yet no gardener may well be without them. Many of us have to be reminded of the existence of this vegetable by occasionally meeting with samples at autumn and winter exhibitions, when as a rule they look tempting enough if fresh; when, however, as sometimes happens, they have been hawked to three or four shows, and have done duty as winners of prizes, their freshness give place to stale discoloration. What should be the proper form and condition of properly blanched Leeks seems by no means clearly defined by exhibition awards. Sometimes the stems are short and very thick, well blanched perhaps from 3 to 4 inches, the whole wearing a coarse aspect. Sometimes they are long and thin, and then imperfectly blanched. I do not know what may have been the blanching operation adopted by Messrs. Dobbie & Co., of Rothesay, but I have not yet anywhere seen prettier, neater, more completely blanched samples of Leeks than they showed of their Champion on Bank Holiday last at Earl's Court. The stems were very even in size, about $\frac{1}{2}$ inches in circumference, and blanched fully 9 to 10 inches, wearing a really tempting appearance. Whether due to the variety, or to the blanching, or both, certainly those samples seemed to be my ideal of what good Leeks should be. *A. D.*

PERISTERIA ELATA GROWING FROM A ROOTLESS PSEUDOBULB.—Amongst the Orchids in my collection when I removed here last spring was a very large plant of *Peristeria elata*. On its arrival we found that a two-year old pseudobulb had been broken from its seat on the journey, the fracture being a fairly clean one, and the injured surface presenting a fresh green and healthy appearance. We at once potted the detached pseudobulb experimentally, in crocks and peat, in a 4-inch pot, and shortly afterwards it developed a healthy growth from the top of the bulb, and this year it is forming two fresh bulbs, one each side of the above-mentioned fresh one. Meanwhile, the old bulb shows no signs of decay whatever. Both this plant and its parent are in the East India-house. The parent plant is in a 20-inch pot, and has eighteen old and nine new bulbs, and is showing for bloom. *R. G. Fletcher, India House, Withdean, Brighton.*

A TROUT IN A TANK.—I remember that the existence of a trout in a pond or tank formed the subject of a note in the *Gardeners' Chronicle* not long since. A few days ago when in the garden attached to Anglesea House, Kingston-on-Thames, I saw a fine trout in an open tank, a large fish probably 12 inches long. It was placed there some three

or four years since when quite small, and had done well ever since. The tank is 6 feet in depth, and 4 feet broad, no very great area. It is supplied by water from the mains, and this is used for watering the garden, so that the water is kept frequently changed. The fish is sometimes fed, but very seldom, and then chiefly with worms. It finds food somehow in its limited prison. *A. D.*

MOULDING ROSE SCHEDULES.—Possibly some such new departure was inevitable as that described in the *Gardeners' Chronicle* in its last issue. Those of us who know most of the inner working of Rose shows have long been weary of hearing the outcry of small growers against the great ones, who use their strength like giants to snatch the prizes from the smaller growers. It is too often the loss of the latter more than the loss to them of honour that makes certain rosarians often anything but lovely at Rose shows. They come up smiling in the morning, full of hope, and perhaps fairly fortified against a fair competition and a honourable defeat on the merits of their Roses; but when flooded with potters, who overrun not a few of our Rose shows, or swamped through mere numbers, human nature gives way; and the Roses themselves are degraded through the petty strife of their masters. Seeing and hearing these things, I have often wished that the money prizes could be knocked off Rose shows altogether, the committee guaranteeing all exhibitors whose exhibits are beyond a certain point of merit against pecuniary loss incurred in travelling expenses. If it is considered a degradation to play chess for money, it ought to be considered a greater degradation to show Roses for filthy lucre, as the potters do. There is yet another and a worse matter that has caused much ill-blood and much heart-burning among rosarians, and that is, the exhibition of Roses by the secretaries and other officials of a society, who have access to full information before the show as to the number of entries, and the character or capacity of the entries, to coin a word. Such circumstances are fatal to all confidence, and are held to explain those transformation scenes on the eve of opening, all too familiar to Rose exhibitors. Were the word to go forth at once that no official in connection with the National Rose Society, nor any societies affiliated with it, shall be permitted to show for money prizes at any of its or their shows, most of the complaints so common of late years would cease. Those who may or do possess special information are more dreaded at Rose shows than those who can pick and choose among their tens of thousands of blooms. No doubt there are advantages in numbers, and it is well, perhaps, to arrange schedules on a numerical basis, say five hundred, five thousand, fifty thousand, as struggles for victory among the Roses; but it by no means follows that those who grow the most Roses will have all the first prizes. It is no uncommon thing to see good rosarians quite lose their heads or their judgment over their big battalions, and leave their best blooms among their spares. For myself, I believe love at first sight among Roses of all sorts, as most likely to win the highest prizes. I hear whisperings of a new classification of exhibitors on other grounds than the number of Roses grown. At last amateurs are to be defined, and marshalled, and kept by themselves, so that each amateur shall only compete with his peers. Before this is done, may I ask are the clergy—no matter how many Roses they grow, show, and some say sell—to be included in this class? If so, would it not be better, fairer to the clergy and all concerned, to give them a class to themselves? Their position is sufficiently unique as rosarians, their skill, their control over glebes and other land in their parishes, their perfect freedom is so complete, that few growers can quite compete with the clergy on equal terms. In a separate class, each of this specially skilful and gifted class would compete with his equals in social and physical environment. The honour of winning would then be greatly enhanced, and Rose culture raised to a higher level. With those with most skill and leisure at their disposal to grow the best Roses ranged in a sort of champion class by themselves, the present classification into growers for sale, private growers, with a third for gentlemen's gardeners who differ greatly from all the others, would seem to cover and suit all the many divisions into which Rose shows are divided. The question of what is an amateur is a nut altogether too old and too hard even for the National Rose Society to crack, and as an old member my advice to all my fellow rosarians is, do not try it. *Rosa.*

HYBRID CURRANT AND GOOSEBERRY.—I hardly understand your correspondent "Senex," on p. 310, where he remarks, "Mr. Culverwell, writing on August the 6th, is in error regarding his hybrid." I do not see the error. The cross was effected between the Black Currant and the Whitesmith Gooseberry. You published proof of that. The effect caused quite a sensation here to all classes of people; and branches with the flowers were sent to you; and this year I have sent you branches with the fruit, which is neither a Gooseberry nor a Black Currant, to all appearance. You were good enough to have it engraved for the benefit of your readers. I hope some of them will improve on it now they know that it can be done. For myself, I question very much if Dr. Maund's cross was ever effected. Seedlings of Black Currants, or any kind of Currants, and Gooseberries too, are often very queer things. I have good proof of that, both in leaves and particularly in the fruit, that anyone might be easily mistaken in the cross; besides, if Dr. Maund had effected the cross for certain, he would have been too glad to have made it known, and I am quite sure it would have been "nuts" for Dr. Lindley; who would have published it to the world as you have done. In a book on the propagation of plants by Mr. Burbidge, published in 1877, he says:—"It is singular to note that the Red Currant, Black Currant, and Gooseberry, will neither interbreed by hybridising, nor will they succeed on each other in the way of scion and stock." If the cross had been known then to Mr. Burbidge he would not have published this statement, for in his book is a mine of information, which every young gardener ought to possess. I may add, that the seed-parent was the Black Currant. The leaves are like those of the Gooseberry, without spines; the fruit like neither, and not a particle of scent like the Black Currant; and, more than that, the Gooseberry caterpillar is particularly fond of the hybrid, whereas they will never touch the Black Currant. *William Culverwell, Thorpe Perrow, North Yorks.*

FRUIT DRYING.—Having studied the question of "Fruit as Food," from every aspect, during the last ten years, I can fully endorse all you say as to the importance of British fruit-growers preparing to preserve their future surplus growths by evaporation. Probably, Pears and Plums would be the best kinds to commence with. At 4d. to 6d. per lb. wholesale, there is a ready sale in the Eastcheap market for all that can be supplied. From California ripe dried Pears, unpeeled, but cut in slices, have been in good demand at 4½d. per lb., or 42s. per cwt. As the lecturing season is now coming on, will you allow me to state that, if the secretary of any gardeners' or horticultural societies will send me a line to the undernoted address, I shall be glad to arrange to give a lecture, or open a debate, quite free of charge, upon the question of "Fruit as Food," or "What is Man's natural Food and Drink?" Besides being probably a novel topic, it offers a new and radical solution to the great questions of England's national vice of drunkenness, and how best to crop the soil, and may afford a clue to enable us to cope with other social and economic questions besides. *W. S. Manning, 32, Alfred Place West, South Kensington, S.W.*

KESWICK CODLIN APPLES.—Although we have several new, or comparatively new, sorts of Apples, to which much attention has been drawn of late years as being valuable for their size, good appearance, and earliness, as well as their quality when cooked, I question if either of them is more reliable or useful than the old Keswick, which very seldom, if ever, fails to crop, let the seasons be what they may. This year, again, trees are heavily laden with fruit, which, though not so large as others referred to, is of fair size and quite taking in appearance and colour. It is, therefore, a kind that should not be neglected; as besides its free-cropping habit, it is in before any other, and the flesh being tender and pulpy, is just the thing for tarts and sauce and other like uses. Lord Suffield, although a fine Apple, is too tender in constitution to be depended on, and should only be planted in warm sheltered places, as otherwise trees are almost sure to go off or fail to do well. Lord Grosvenor is a hardier kind and a robust grower, and one that should be in every garden or orchard, as also Grenadier. But as these early Apples do not keep long, it is useless planting them in quantity, except for market purposes, unless the consumption is unusually large, as there are plenty of others that come in during the autumn and make a succession. *J. Sheppard.*

PRUNUS PISSARDI.—As it flowers so early in the year, the frost injures it, but a few fruit have been gathered from the wall, and a large quantity from pot plants in a cold orchard-house. *W. H. M., Munches, South-West of Scotland.*

FIGS AT CHISWICK.—I read the remarks anent the Figs at Chiswick with great interest, but am somewhat surprised that no mention was made of White Marseilles among those noticed, as by most growers that variety is considered one of the very best for culture under glass, as it is a prolific cropper, and of rich flavour; the only fault I have to find with it being that it is subject to scale or get injured in its skin by the sun, and sometimes we lose many of the fruits in that way. I note that it is stated of the Figs at Chiswick, and, of course, the remarks apply elsewhere, that the best kinds do not bear a first crop, which is greatly against them, as indoors that is of the first importance in places where room is limited; and from what is said as to the good qualities of Bourjasotte Grise, I hope that variety is an exception, for I should like to add it to the only two sorts we grow at present, which are White Marseilles and Brown Turkey, and I shall therefore be glad to hear more about it. *J. S.*

SCIADOPITYS VERTICILLATA.—In reference to this species, I may say that my plant grows in peaty soil, and thrives very well, making growths of 8 to 10 inches annually, and is about 9 feet high. *W. H. M., Munches, South-West of Scotland.*

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 7.—The frozen blooms of Chrysanthemum sent from Wellington, New Zealand, by Mr. John Earland [and mentioned in our report of the show last week. *Ed.*], were brought before the Floral Committee, Sir Edwin Saunders, the President of the society, being in the chair. The cylinders containing the blooms were turned out one by one, and the ice being very transparent, the flowers could be clearly seen, also the green leaves attached to two or three of the blooms. As the blooms were examined, the names were given, and descriptions read by the Secretary, Mr. R. Dean. There were eight blooms, in six varieties, two of them being in duplicate.

The examination showed that the flowers were of good size and depth, and broad petalled. The plants from which they had been cut were raised by Mr. Earland, from seed gathered from Thunberg, Comte de Germiny, and Edwin Molyneux, and, like their parents, the seedlings partook of the incurved character. The seeds were saved in the Australasian autumn of 1890, and out of seventy plants obtained came the blooms sent to England. The varieties were Rimutaka, one bloom, an incurved variety in the way of Lord Wolsely, but with more chestnut in the colour, and broader petals (Commended); Lady Bell, one bloom, a white Japanese, something in the way of Lady Trevor Lawrence, very promising (Commended); Tarawera, two blooms, a yellow Japanese of large size, broad in the petals, and highly promising (First-class Certificate of Merit); Zealandia, two blooms, a silvery-lilac incurved Japanese, the reverse bright vermilion-pink, broad petals (First-class Certificate of Merit); J. J. Kerslake, one bloom, also a white Japanese of the character of Stanstead White (Commended); and a small and somewhat undeveloped bloom of Tongarero, a pink-reflexed Japanese. In addition to the Certificates and Commendations, the Silver-gilt Medal of the Society was awarded to Mr. Earland in recognition of his enterprise in sending the blooms to this country. From Mr. J. Agate, Fareham, came an early white-flowered decorative Japanese Lady Fitzwygram (Certificate of Merit). Sydenham White, a white-flowered Japanese, from Messrs. Reid & Bornemann, was thought to be identical with an American variety named Mrs. Phelps. Certificates of Merit were awarded to Cactus Dahlias Kaiserin, Countess of Gosford, Countess of Radnor, and Bertha Mawley, from Messrs. Keynes & Co.; and to H. E. Milner, from Mr. C. Turner. To Pompon Dahlias Amber and Hilda, from Mr. C. Turner; and Tommy Keith, from Mr. J. T. West. To Gladiolus Grand Vainqueur and Mont Blanc, two very fine varieties, from Mr. W. H. Fowler, Taunton; and to single Dahlias Jack, yellow satin; and Cadet, from Mr. T. W. Girdlestone. To Tomato Challenger, from Messrs. Collins Bros. &

Gabriel. A Commendation was given to an early white Kidney Potato, from Mr. J. Aplin, of Gloucester. A new tube and cup for Chrysanthemum blooms, sent by Dr. Geo. Walker, Wimbledon, was commended. A hearty Vote of Thanks was given to Sir Edwin Saunders, for presiding.

HENLEY AND DISTRICT HORTICULTURAL.

SEPTEMBER 7.—The above Society held its annual show, but the weather being unfavourable, the number of visitors was very small compared with previous years, although the number of the exhibits was greater than usual. Vegetables were largely shown, and of good quality, gardeners, amateurs, and cottagers alike, making a good display. Messrs. Laing & Son sent a stand of Tuberous Begonias; Messrs. Sutton & Sons, a fine display of cut flowers, also Gloxinias; Mr. J. R. Tranter showed good Dahlias; also Mr. Phippen, of Reading, various plants and cut flowers. Mr. W. Pope was 1st for a group of plants, showing good Caladiums, Crotons, &c. Mr. S. Ely, gr. to Mrs. Havers, Joyce Grove, Nettlebed, was 2nd, with a group consisting of Caladium, Graptophyllum Nortoni, Crotons, Vallota, Adiantum, Acalyphas, &c. The best specimen plant flowering was an Eucharis amazonica, shown by Mr. Pope; and the best foliage plants were shown by Mr. P. Knowles, gr. to F. Crisp, Esq.

SCOTLAND.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL SOCIETY.

This Society's autumnal exhibition of flowers, plants, fruits, and vegetables was admitted on all hands to have been the finest show of horticultural produce ever seen in Glasgow; the whole of the classes being strongly represented, there being 1012 entries, and nothing of secondary merit was to be seen in the exhibition. The building (St. Andrews' Hall) being somewhat dark for doing justice to such a fine display, was against the interests of the Society, but it is hoped that this may be remedied another season.

The tables from nurserymen made a splendid display. Two were from Messrs. Smith & Simons, and one from Mr. Sutherland, of Lenzie; each was loaded with choice Crotons, Palms, Liliams, Heaths, Ferns, &c. In the class for competition, Messrs. J. & R. Thyne were 1st, with an elegant display of Dracenas, Pandanus, Oncidiums, Caladiums, Crotons, and other choice species; Messrs. Austin & McAslin were a good 2nd, with a choice selection.

The gardeners' tables, thirteen in number, were well arranged, and consisted of Pancratiums, Cliveas, Crotons, Hydrangea paniculata, Palms, Ferns, and Heaths, as the choicest exhibits. The 1st prize was won by Mr. H. McInlay, gr., Oakleigh.

Plants for table-decoration were exhibited in a long line dividing the fruit tables; the species were chiefly Aralias, Dracenas, Crotons, and Pandanus. The 1st prize was awarded to Mr. Sutherland, nurseryman, Lenzie; 2nd, Messrs. Aitken & Sons, Lenzie.

Begonias made a grand display, the collection from Mr. Ware, Tottenham, exciting much enthusiasm, and it was really one of the leading features of the show. A First-class Certificate to Charles Macdonald Williamson was awarded.

Ferns were well shown; Gleichenias were exceptionally fine. 1st, Mr. C. K. Dalgarno, gr., Milton; 2nd, Mr. Mitchell, Thornwood, Langside.

Tables as specimens of dessert-arrangement were prominent objects. 1st, Mr. David Cross, 138, Queen Street, Glasgow—an oblong mirror ran along the centre, on which were placed vases furnished with flowers and foliage, Fern and Lycopodium being used largely to tone down the brilliant golden vases. An ornamental centrepiece of flowers had a lamp at each side, chastely ornamented with Lycopodium and flowers. The 2nd prize was taken by Mr. McIntyre, gr., Parkhouse; though this was less elaborate with glass and metal, it was neat and tasteful. There were numerous Palms, Crotons, and other large plants placed throughout the Hall with

good effect. The orchestra was well furnished with specimen Palms and Dracenas by Messrs. Thyne.

Cut flowers made an immense display, especially Carnations, Asters, Marigolds, herbaceous plants, &c. The exhibits by Mr. Dobbie, Rothesay, were excellent. Roses, from Messrs. Cocker, Aberdeen, were very fine for the season. This firm was 1st for twenty-four very choice blooms; Mr. Robertson, nurseryman, Helensborough, was a capital 2nd.

In the gardeners' class for twelve Roses, Mr. Craig, Beith, had a fine exhibit, and was awarded 1st prize; 2nd, Mr. J. Hood, Helensborough. Mr. Campbell, nurseryman, Blantyre, had a great display of Carnations in sprays, bunches, and in stands; also a large and choice collection of Dahlias and Pansies. Dobbie's collection of Pelargoniums was an extensive exhibit. Single Dahlias, in bunches, were of great merit. The 1st prize was awarded to Mr. J. Wilson, gr., Bloomhill. Everlasting flowers, in bouquets, formed a great attraction, there being twelve competitors, and the competition very close. Bouquets for hand, table, and button-holes were observed in great numbers, and above average merit. Mr. Mair, nurseryman, Prestwick, had an exhibit of twenty-four of the finest spikes of Gladioli ever seen in Glasgow—De Mirbel, Baroness Burdett Coutts, Sceptre de Flore, bicolor L'African, and Conquerant were really wonderfully fine. The gardeners' class was well represented, and a 1st prize was awarded to Mr. Mathew Smith, Roslea.

Dahlias were large, clean, and well formed. The 1st prize was awarded to Mr. Campbell, Blantyre, for twenty-four fine blooms; Mrs. Langtry, Mrs. Gladstone, Wm. Garret, T. West, John Hickling (a new one), and Countess of Ravensworth were among the best. The 2nd prize was awarded to Messrs. Aitken & Sons, Lenzie. The gardeners' classes were also well represented by fine show Dahlias.

Fruit.—This was mostly of high quality. Mr. McConachie, Cameron House Gardens, had 1st, for a collection of twelve dishes, his Muscat and Hamburg Grapes being very good; Peaches, Cherries, and Plums were also fine. Mr. Crosbie, gr., Buchanan Castle who was 2nd, had fine Figs, Peaches, Nectarines, and Alicante Grapes.

In the collection of hardy fruits, the best was disqualified for exceeding the numbers specified to form the dishes, and the lot which was awarded the 1st prize was not of special merit.

In the classes for Grapes, there were thirteen exhibits for the Black Hamburgs, all good, and the pair of bunches from Keir were very fine in every respect, and Mr. Lunt was awarded 1st prize; the 2nd and 3rd going to Mr. Cadzow and Mr. Leslie, Perth, in the order of their names.

In the class for any other black, Mr. McBean, Craigend, was well ahead of his rivals, for wonderfully fine bunches of Alicante; Mr. Leslie was 2nd, for Gros Maroc; and Mr. Halliday, Ayr, 3rd, for fine Alicante. Mr. Lunt had 1st for finely-coloured Muscat of Alexandria; 2nd prize was awarded to Mr. Crosbie; and 3rd to Mr. McConachie, for fine examples. Other white Grapes were represented by very fine bunches of Buckland Sweetwater, from Mr. Machonachie.

There were some very fine Apples in the classes for kitchen sorts, Mr. Strathdie, Tarbolton, being awarded 1st prize, for six varieties, four of each: Mr. Bogie being a good 2nd.

Peaches were large and well coloured. The 1st prize exhibit was shown by Mr. McBean; 2nd, Mr. Lunt; and 3rd, Mr. Halliday.

Melons were numerous, but only a few were finely flavoured. Mr. Gibson, gr., Muldsie Lodge, was 1st; Mr. Austin, Blairmore, 2nd.

Vegetables.—These were of great excellence, and all the classes well represented. Mr. McBean's collection of twelve sorts left nothing to be desired, his Cauliflowers, huge Leeks, Celery, and large handsome Onions being worthy of special notice; Mr. Gibson, Dalry, was 2nd; and Mr. Millar, Castlemilk, 3rd, with very meritorious exhibits.

The collections raised from Messrs. Sutton & Son's seeds were of first-rate quality, Mr. Gibson, Dalry, being awarded 1st.

Potatoes were in fine form. There were long tables loaded with splendid Turnips (yellow), Leeks, Parsnips, Carrots, and Tomatoes (very clean and handsome), showing high culture. Parsley in pots was an attractive exhibit, and competition was very keen. This is a fine feature at many of the Scotch shows. The Glasgow Horticultural Society may be justly proud of this splendid exhibition. *M. Temple.*

ROYAL CALEDONIAN HORTICULTURAL SOCIETY,
EDINBURGH.

This enthusiastic society held its autumnal exhibition in the Waverley Market on Wednesday and Thursday, September 7 and 8, and it was admitted by experts that the Grapes were of finer quality than those exhibited at any previous show in Edinburgh. In most of the Grape classes the competition was very keen. Outdoor fruit, on the contrary, was comparatively poor in quality, whilst Peaches and Nectarines, from under glass, were excellent in every respect. Pines were fairly plentiful, mostly Smooth Cayennes; the few Queens which were exhibited should not have been taken to any show. Apples and Pears, from under glass, were really good, and mostly appeared in the collections of fruit. The collection of twelve dishes was most creditable to the exhibitor, Mr. McKelvie, Broxmouth. The Muscats of Alexandria were large in bunch and berry, and beautifully coloured. Gros Guillaume were a pair of grandly-finished bunches of large size, and Alicante, also very perfect and of great size. Brown Turkey Figs, Melon Duchesse Belgarde, Barrington Peaches, Humboldt Nectarines, Plums, Apples, Pears, and Apricots formed a collection such as is rarely equalled for general excellence. Mr. Boyd, Callendar, was 2nd with grand Black Hamburg, Madresfield Court, and Alicante Grapes, the bunches of the latter being 16 inches long, and large and handsome. The Peaches were also very fine. The 3rd prize was awarded to Mr. Hunter, gr., Lambton Castle, Durham, his Gros Maroc Grapes were very fine, and Figs, Apples, and Pears first-rate. Mr. Murray, Culzean, was also well represented in this class.

The prize for a collection of eight dishes was also carried off easily by Mr. McKelvin, with fruit similar to that described in his exhibit for the class for twelve dishes. Mr. Smith, Oxenford, had a capital 2nd, his Muscat Grapes, Peaches, and Nectarines being of much merit; Mr. Hunter, Lambton Castle, was 3rd. In the class for twelve dishes of hardy fruit grown in the open, Mr. Dow, gardener, Newbyth, was 1st, his Stirling Castle Peaches and Noblesse were good; Nectarines and Morello Cherries were of fine quality. Mr. Day, gr., Galloway House, had a capital 2nd; and 3rd went to Mr. McIntyre, gr., The Glen. Mr. Hunter, Lambton, had 1st for a collection of orchard-house fruits, twelve dishes, which were of very fine quality. Wonderful Pit-maston Duchess and Souvenir du Congrès Pears, Lord Napier and Pine-apple Nectarines, and finely-coloured Apples, were his best dishes.

For a collection of six bunches of Grapes, Mr. Boyd, Callendar, was 1st, with large bunches of Madresfield Court, Alicante, and Black Hamburg, finely coloured, and large in berry. Mr. Murray, gr., Park Hall, was 2nd, with handsome bunches, and beautifully finished, of Muscats, Alicantes, Cooper's Black, and Madresfield Court; Mr. Kirk, gr., Alloa, was 3rd, with very fine bunches of Black Hamburg, Buckland Sweetwater, Alnwick Seedling, Gros Maroc, and Muscat of Alexandria. Magnificent as the prize-winner's bunches were, they barely exceeded those in the other exhibits, which came from Mr. Leslie, Pitcullen; Mr. Day, Galloway House, Mr. Green, Yester, and Mr. McKinnon, Melville House. Such close competition is seldom seen, and was never equalled in Edinburgh.

For four dishes of Grapes, Mr. Leslie was 1st, with grand Muscats, Alicantes, Black Hamburgs, and Gros Marocs. 2nd, Mr. Murray, Park Hall; 3rd, Mr. Green, Yester, and Mr. Kirk, equal, all very perfect bunches. For two bunches Black Hamburg, 1st, Mr. Murray, Park Hall; 2nd, Mr. McKinnon, Melville; 3rd, Mr. Boyd. In this class

we should like to see greater excellence. Two bunches of Muscat of Alexandria came from Mr. McKelvie, whose exhibit was a capital one in every respect. Mr. Mattison McCurrie and Mr. Day were 2nd and 3rd respectively.

In the other classes, in which all the best-known Grapes were tabled, fine quality was strongly represented (fifteen classes in all). The Pines and Melons may be passed without any special remarks on them. Mr. Lunt's 1st prize Peaches were equal to those he has often brought in such excellent condition from Keir. Good 2nd and 3rd came from Messrs. Williamson and Boyd. Nectarines were mostly first-rate. Mr. Lunt was 1st, with excellently-coloured Elruge; and Mr. Hunter was 2nd, with very fine Pine-apple Nectarines. Apricots were plentiful, but none of very remarkable quality. Mr. Cossar was 1st, with a dozen very clean fruits.

In some forty-five collections of Plums, Apples, and Pears, competition was somewhat strong, and excepting the fruits which were grown under glass, the greater portion of the exhibits were much like what are too familiar to visitors of shows this season—very moderate in quality, showing the effect of untoward weather. Raspberries were plentiful, and of fair quality. Currants were remarkably fine, especially red. Among the exhibits, not for competition, two baskets of Grapes of fine colour and large in berry, came from Messrs. Thomson, Clovenfords, showing how these fruits can be transmitted to a distance, with bloom as perfect as when they left the vineries—the variety indicated was Cooper's Black. On a table was a branch of Cherry Crahs loaded with fruit, sent from Eynsham Hall, Oxon, a class of fruits very useful, but not used to the extent they ought to be.

Flowers.—Roses were a great show. Messrs. Cocker and Croll taking 1st and 2nd prizes respectively for thirty-six blooms—Mrs. John Laing, Salamander, Margaret Dickson, Climbing Niphetos, Prince of Wales, and Merveille de Lyon, were among the best on the table. Messrs. Dickson of Belfast, and Smith & Sons, Stranraer, had fine collections, and they were not like the prize exhibits, mutilated out of character by twisting the petals out of their place—a practice which, experts say, should disqualify them, and so say we.

Cut flowers generally were numerous, and many of them in fine condition.

Begonias from Mr. Ware, of Tottenham, were a grand exhibit. His doubles were much admired.

Messrs. Dickson, Belfast, and Cocker & Sons, had 1st and 2nd prizes respectively for Show Dahlias. Numerous exhibits of these came from gardeners.

Stewart & Mein, of Kelso, had a grand display of Gladiolus, thirty spikes of great size.

Laird & Sons had large spikes of single Dahlias, and were awarded 1st prize. A long table of cut flowers of choice species came from Mr. Forbes, Ilawick Nurseries. Carnations, Hollyhocks, Violas, Pentstemons, and double Begonias were remarkably fine. Antirrhinum Crimson Bedder is a capital acquisition, a good companion to the white variety.

Plants.—On the numerous tables were many beautifully-grown plants. The Orchids (which for the season were fine) filled a table, and they were greatly admired. Mr. Sharp Freeland, taking the lead in several classes; his Vanda Sanderiana excited much enthusiasm; a fine *Miltonia Moreliana*, with twenty-five spikes; *Dendrobium Schroderianum*, *Cypripedium Sedeni*. Mr. Wilson, Westmount, Glasgow, showed well. Mr. Curror, Eskbank, and Mr. Barlas had *Miltonias*, *Cypripedium Chamberlainianum*, and *Vanda cœrulea*, in fine form.

The tables of pot plants, as usual, formed the bulk of the show. Mr. McIntyre, Darlington, was 1st, for a finely-arranged table of fresh, healthy stove and greenhouse plants—Crotons, Cattleyas, Dracænas, being among the best and most telling species; Mr. Wood was 2nd for a similar selection, but which was rather heavier in arrangement.

Mr. Glass, George Street, had a long table of Palms, Liliams, white Lapagerias, white-flowered

Heaths, and *Araucaria excelsa*, in great numbers, and of fine table size.

Messrs. Methven's long table of Begonias was very attractive, and of much excellence; they had, also, a table of flowering and foliage plants, and one of the finest ever that enterprising firm exhibited in Edinburgh.

Mr. D. W. Thomson, of Golden Acres, &c., had a fine display arranged along the floor, of their choice Crotons, Dracænas, Pitcher Plants (these were hung up with fine effect); Ferns, Palms, and Liliams were numerous, and the whole backed by tall Palms. Messrs. Birkenhead, Manchester, had also a fine display.

Messrs. Laing & Mather had a table of splendid Carnations—cut blooms and in pots—arranged tastefully among Ferns. *Adiantums* and *Davallias* were in fine condition from Rockville. *Gleichenias* were a fine exhibit; Mr. McIntyre, Darlington, was awarded 1st prize in this class. Ferns generally were numerous and good. Tables of Fuchsias and other flowering plants filled large spaces. A long table of plants and cut flowers came from Dickson & Co.; and Dickson & Sons had choice Coniferæ in tubs.

In the vegetable classes, the exhibits were remarkably fine—Onions, Carrots, Leeks, Tomatoes, and Potatoes as good as one rarely sees. In the collection for twelve sorts, Mr. Low, of Stirling, had a capital basket, most tastefully arranged in Parsley; his Cauliflowers, Onions, Celery, Leeks, and Cucumbers were very perfect. Mr. Harper and Mr. Roe were awarded 2nd and 3rd respectively. Mr. Murray, Park Hall, had a dozen splendidly-formed Tomatoes for his prize lot. This class had many fine exhibits in it; but the long tables of fine produce showed that the season helped to make the vegetable classes very attractive at that splendid exhibition.

PAISLEY HORTICULTURAL.

Thursday, Sept. 8.—The above Society held its show in the George A. Clark Town Hall, Paisley. The entries were in number about the average of former shows. The quality of the exhibits was excellent all round, fruit perhaps, which was not a strong feature, being the exception. Cut flowers, such as Asters, Dahlias, Marigolds, and other popular florists' flowers and annuals, were exceptionally good, Roses were, considering the date, splendidly shown by Messrs. Alex. Dickson & Sons, Newtownards, co. Down, one box of Mrs. John Laing being very worthy of the high admiration it received. A good display of Roses was also made by Messrs. Smith & Sons, Stranraer. Messrs. Dobbie & Co., Rothesay, were in strong evidence with a fine display of their remarkable productions in florists' flowers, annuals, and select vegetables. Mr. Cuthbertson, Rothesay, had an extensive, varied, and interesting collection of cut flowers of autumn-flowering hardy perennials. Mr. Alex. Lister, Rothesay, exhibited along with other good things in cut flowers, a new seedling Gladiolus named *Pride of Rothesay*, which appeared a promising production. The blooms were of great size, and of such substance as to appear to be modelled in wax, delicate flesh-colour faintly striped rose, merging into bold flames of crimson in the throat. Mr. Macfee, secretary to the Society, exhibited an interesting lot of early-flowering Chrysanthemums. Mr. Morgan, Falside Nursery, and Mr. Stewart, Carriagehill Nursery, each contributed to the attractions with interesting collections of miscellaneous pot plants. But the most striking collections of plants were those exhibited by Mrs. Coats, Ferguslie House, and from Woodside by Mr. Archibald Coats. The Ferguslie group comprised noble specimen Palms, a large well-flowered *Brugmansia Knightii*, finely-coloured Dracænas, Crotons, and a wealth of colour in Celosias, Liliams, Chrysanthemums, &c., which was made the most of in the skilful hands of Mr. Duncan MacDonald, the gardener. The Woodside group differed chiefly from the Ferguslie group in having a few Orchids and Pitcher plants introduced, which gave a rather *recherché* air to the whole, which was very judiciously arranged by Mr. Hogg, gardener there.

The leading prize-winners in the competing classes of plants were Mr. Wm. Cameron, gr. to Col. Thos. Glen Coates, Ferguslie Park; and Mr. Jas. Maxwell, the latter distinguishing himself in the larger number of the classes.

In cut flowers first honours were shared equally by Messrs. W. Cameron, Robt. Crawford, Lochwinnoch; John Meikle, Bridge of Weir; M. Smith, Prestwick; Hugh McKochnie, and others, who gave no address.

In vegetables, Messrs. Walter Shearer, Renfrew; Alex. Carnochan, John Brown, the gardens, Newfield, Johnstone; J. McGregor, Hugh Duncan, John McDougall, Wm. Cook, Robt. Ioglis, and George Lang were the principal prize-winners in a pretty stiff competition.

HORTICULTURAL EXHIBITION AT EARL'S COURT.

THE show of autumn flowers on the 8th and 9th inst. made a very pretty exhibition. The entries were numerous, and the space usually available for such displays was well filled. Large and tastefully-arranged groups of Gladiolus, Dahlias, and other flowers contributed to a greater floral display than has been seen here, if we except the Rose exhibition. The first class was for a collection of bunches of stove and greenhouse flowers, in not less than twelve varieties, and a pretty collection, consisting of choice kinds, was shown by the successful exhibitor, Mr. A. Gibson, gr. to T. F. Burnaby Atkins, Esq., Sevenoaks. Mr. J. Prewett, Hammersmith, who came next, also staged very choice specimens in smaller bunches. For a collection of Gladiolus, to consist of cut spikes, open to nurserymen, Messrs. J. Burrell & Co., Cambridge, were the winners, staging some 190 or more spikes of first-rate quality. First-class Certificates were granted to Hetty Dean, Mrs. Peter Blair, Mrs. Jno. Wills, and Irene Harkness; Messrs. Harkness & Sons, Bedale, Yorks, were 2nd, showing about eighty species. In the amateur class, Mr. E. B. Lindaeil was the only exhibitor, but his collection of sixty spikes was highly meritorious.

Dahlias.—In the leading class for nurserymen, for sixty varieties of show and fancy Dahlias, the 1st prize was secured by Messrs. Keynes, Williams & Co., Salisbury, with a similar exhibit to that which secured 1st place at the National Society's show at the Crystal Palace. Mr. Chas. Turner, Slough, was again 2nd, and Mr. Geo. Humphries, florist, Chippenham, 3rd. Mr. S. Mortimer was 1st for twenty-four show Dahlias, with a very fine lot of large and well-formed blooms. He was followed by Mr. J. Walker, nurseryman, Thame, Oxon, and Messrs. Saltmarsh & Sons, Chelmsford.

In the amateur division, Mr. Thos. Hobbs, Easton, Bristol, was 1st for twenty-four show and fancy Dahlias, being followed by Mr. J. T. West, gr. to W. Keith, Esq., Brentwood, and by Mr. Sydney Cooper, Hamlet, Chippenham. An extra prize in this class was awarded to Mr. Geo. Boothroyd, Red Hill, Hants.

For twelve show and fancies, Mr. Sydney Cooper was 1st, Mr. J. B. West 2nd, and Mr. T. Vagg, gr. to Jas. Theobald, Esq., 3rd.

For a collection of Dahlias (any type), arranged for effect, open to nurserymen—and it was this competition that secured the delightful effect that was obtained along nearly the whole side of one of the rooms—Messrs. Keynes, Williams & Co., Salisbury, who secured the 1st position, had a magnificent group, about 30 feet long, at the back of which were beautifully set up flowers representing pyramids, pillars, &c. The pyramids were formed by Cactus Dahlias, and the pillars with Pompons, whilst the show varieties were shown in groups at the front. Messrs. J. Cheal & Sons, Crawley, were 2nd with an elaborate arrangement in the centre of which were terraces, culminating in a crown composed of single varieties; whilst the 3rd position was filled by Mr. Thos. S. Ware, Tottenham, who showed a very telling group, relieved by Asparagus foliage. This class must have occasioned the judges some little

consideration, so equal in excellence were the 2nd and 3rd prize collections.

For eighteen Cactus or decorative, in bunches of six, Mr. Chas. Turner, Slough, was 1st; Messrs. Keynes, Williams & Co., 2nd; and Messrs. J. Cheal & Sons, Crawley, 3rd. Mr. Turner occupied the same position again for twenty-four Pompon varieties; Messrs. Keynes, Williams & Co., 2nd; and Mrs. M. V. Seale, Sevenoaks, 3rd.

Asters.—Messrs. Saltmarsh & Sons, The Nursery, Chelmsford, showed best, securing 1st prize for twenty-four French Asters, with a collection that, perhaps, was not so good as some we have seen in other seasons; Mr. Sydney Cooper was 2nd, and Mr. John Walker, Thame, Oxon, 3rd.

In the class for 12 French varieties, Mr. John Walker was 1st; Messrs. Saltmarsh & Sons, The Nursery, Chelmsford, 2nd; and Mr. Sydney Cooper, Hamlet, Chippenham, 3rd.

The competition for a group of Chrysanthemums,

effect of the whole. Messrs. E. D. Shuttleworth, Peckham Rye, had an immense group of Palms, stove and greenhouse plants, Lilliums, &c., arranged at the end of one of the annexes, for which they were awarded a Gold Medal.

Silver-gilt Medals were awarded to Messrs. B. S. Williams, for a very fine group of foliage plants, Crotons, &c.; Messrs. Paul & Son, Cheshunt, for a collection of hardy flowers, Roses, &c.; to Messrs. Jno. Laing & Son, Forest Hill, for hardy herbaceous flowers, Roses, Begonias, fruit trees in pots, and a collection of Apples; to Messrs. Chas. Lee & Co., Hammersmith Road, W., for a collection of hardy decorative plants, also for hardy flowering Dahlias, Lilliums, &c.; to Messrs. H. Lane & Son, Berkhamsted, for fifty-six dishes of fruits; and to Messrs. Cannell & Sons, Swanley, for a very fine collection of Dahlias. Mr. Chas. Turner, Slough, obtained a Silver Medal for a pretty collection of Dahlias. Mr. J. Walker, Thame, for another collection of Dahlias, as did also Mr. S. Mortimer, Rowledge, Farnham. Messrs. Jarman & Co., Chard, Somerset, showed a collection of Dahlias, hardy flowers, &c., and were likewise awarded a Silver Medal. Mr. E. F. Such obtained a Silver Medal for a group of herbaceous flowers, Roses, Dahlias, &c.; Mr. R. Nicholas, South Kensington, for six good Pine-apples; Messrs. Cutbush & Son, Highgate, for a collection of hardy flowers; Mr. J. R. Chard for a table arranged for dinner; Messrs. Pitcher & Manda for a collection of hardy flowers; Mr. J. T. West, gr. to W. Keith, Esq., Brentwood, for a collection of Dahlias; Mr. Arthur Rawlings, Dahlia Nursery, Romford, also for a collection of Dahlias, Mr. Geo. Garner, gr. to Mrs. Braddlyl, Amberwood, Christchurch, for a nice collection of fruits, including good bunches of Grapes Alnwick Seeding and Madresfield Court, also Apples, Melons, Tomatos, &c.; Mr. W. Wrede, Luceburg, Germany, for a collection of cut blooms of Pansies, &c.; Mr. W. Carr for six dishes of large and well-coloured Peaches. Bronze Medals were awarded to Mr. Geo. Humphreys, Chippenham, for a group of Dahlia blooms; Mr. W. Wells, Earlswood Nursery, for a group of Chrysanthemum blooms; to Mr. W. Welsford, South Lambeth, London, for a collection of hardy flowers, &c.; to Mr. McIndoe, for six dishes of Peaches; to Mr. Richard Dean, Ealing, for a collection of Beans; and to Mr. H. Walter Salmon, West Norwood, for a collection of fine Asters.

Michael Saul

Obituary.

MICHAEL SAUL.—We regret to record the death of Michael Saul, a well-known gardener, and writer on horticultural subjects in these columns. We extract from a full account of his life up to the year 1876, which appeared in these pages on January of that year, the following details:—Saul was born on June 29, 1817, at Carey's Wood, Castle Martyr, co. Cork. His father was gardener to the Dowager Countess of Shannon at Carey's Wood, an enthusiastic horticulturist, who understood plants well, and took the liveliest interest in their cultivation. In the year 1836 the Earl of Shannon, having bought East Cowes Castle in the Isle of Wight, Saul's father was taken there as gardener and manager of the place. After the family had gone to East Cowes Castle, young Saul determined to take to gardening as a profession, and in 1837 he went to the Durdham Down Nurseries, Bristol. Here he learned the propagation of plants under Mr. Mayes, and in March, 1838, he went as foreman under Mr. Hatch, at Leigh Court, one of the most famous gardens near Bristol. He learned much from Hatch, who was a clever and painstaking man, growing Pines and Grapes very well. In 1842 Saul left Leigh Court, to go as foreman at Bowood, under Mr. Spencer, and whilst here he profited greatly in the matter of fruit culture, Bowood being then one of the leading places for fine fruits, especially Pines and Grapes. In February, 1846, we find Saul at Messrs. Koight &

in pots not exceeding 8 inches, lay between Mr. E. Vince, Highgate, and Mr. Norman Davis, Camberwell, who were placed in the above order, being the same as at the Aquarium Show.

For a collection of Sunflowers, Mr. G. H. Sage, Ham House Gardens, was 1st, and Messrs. J. Burrell & Co., Cambridge, 2nd; Mr. Sage likewise secured the 1st position for a collection of Michaelmas Daisies.

Fruit.—The classes for fruit were few, and in two of the classes there were no entries. Mr. J. McIndoe, gr. to Sir J. W. Pease, Guisborough, Yorks, was 1st for three varieties of cooking Plums; Mr. Carr, gr. to Mrs. S. Clarke, Croydon Lodge, 2nd; and Mr. G. H. Sage, 3rd. Mr. W. Con was 1st for three varieties of dessert Plums; Mr. Peter Blair, gr. to the Duke of Sutherland, 2nd; and Mr. McIndoe 3rd.

Cut Flowers.—There were several classes devoted to these, and the exhibits were good and tastefully arranged. Mr. J. R. Chard was 1st for the hand bouquet, for the floral design suitable for funerals, and also for a vase of flowers and foliage on the natural stems.

Miscellaneous exhibits were perhaps exceptionally numerous, and added considerably to the general

Perry's Nursery, Chelsea, where he stayed over two years, exchanging it for the situation of head gardener to Lord Stourton, Stourton Castle, Knaresborough, in 1848. He soon put a different face on garden matters at Stourton, greatly improving the appearance of the wall trees, Vines, and Pines, and planting largely standard, dwarf and pyramid Apples and Pears, and instead of poor crops of miserable fruits he succeeded in securing in the average of seasons good crops of fine fruit. In the planting of choice Conifers, and ornamental trees and shrubs generally, much was done to improve and beautify the gardens and pleasure grounds. He was thirty years at Stourton, only relinquishing his charge in 1878, and dying at Manchester, August 27 this year; he was buried at Stourton Cemetery.

POTATOS AT CHISWICK.

THE members of the Fruit and Vegetable Committee of the Royal Horticultural Society turned up in large numbers at Chiswick on Tuesday last, for the purpose of examining the ninety, or thereabouts, sorts of Potatos grown there this season. Some few of these are old varieties, but the bulk are new ones. Some few also proved to be much diseased, but the majority gave clean crops, or with very few tubers; some, again, gave poor or rough crops, others gave almost wonderful ones. The duty of seeing two or three roots of so many varieties first lifted, then of selecting from the most promising for cooking, and finally tasting these cooked samples, was a somewhat onerous one. Twenty varieties were ordered to be cooked, and it is due to Mr. Barron's staff to say that this work was admirably done, each dish being presented at table in the most attractive condition. Finally, there were selected for the higher award of three marks—of older varieties, Laxton's Early Short-top, Reading Giant, and The Canon; and of new ones, King of the Earlies, a first-rate stock, of the Ashleaf type (Ridgewell); and Boston No. 22 (Johnston), the latter a splendid cropper, every tuber of even and good size, clean, and of a good Regent type—quality first-rate. Two marks were awarded to White Russet (Harris), Paul's White Round, and Crawley Prizetaker (Cheal). It was resolved that samples of the selected varieties should be submitted for Certificates at the next Drill Hall meeting.

A TRAVELLER'S NOTES.

(Continued from p. 305.)

A CALCUTTA NURSERY, January 12, 1892.—Mr. Chatterjee has a shop in the European quarter, close to the Government House; here he sells his porcelain pots, and makes his bouquets, button-holes, &c.—chiefly the employment of his younger brother. All his stuff for cut purposes is grown at a nursery between here and Benares (at Baidyanath Junction), which he tells me is 100 acres in extent. By special arrangement, the Bombay-Calcutta mail stops daily to pick up his cut flowers—chiefly Roses and Ferns. For an average bouquet (small) he gets 40 rs.; but for drawing-rooms, of which there is one annually, he sometimes gets 250 rs., which, putting the rupee at 1s. 5d., is £19 15s. 10d. His average takings on such an occasion are between 2500 and 3000 rs. He is also about—in fact, the nucleus is formed—to start a branch establishment at Darjeeling, where he will grow Ferns, Pelargoniums, &c., in the hot season, bringing them to Calcutta in the cool. His Calcutta nursery, about 10 acres in extent, is situated some distance from the European quarter, right at the extremity of another side of the town. He is building a new house—a tremendous place.

On either side of the entrance leading into the grounds are fine clumps of *Livistonia Martiana*, that on the right, broken up by a few *Oreodoxas*, being several yards long, and from 10 to 12 feet high—a fine mass.

The show-house is 350 feet long by 33 feet wide, its sides, end, and top being covered with Oollu-grass, tied on wire netting, on thin cast-iron supports stuck in the ground. A low brick bed runs the whole length of both sides, on which—many of them sunk in soil—are pot plants, such as *Crotons*, *Dracænas*, *Palms* (chiefly *Areca lutescens* and a few

Pritchardia pacifica), flowering *Anthuriums*, and *A. crystallinum*, all ready for sale.

The centre of this house is laid out with large beds—about eight in all, nicely undulating and edged with rockery—of various shapes, circular, oblong, diamond-shaped, &c. Two of them have small tanks. These beds entirely occupy the body of the house, and are divided by cross paths from each other, running into the broad main-path encircling the house. They are planted with all kinds of stove plants, Ferns and Palms. Most striking is the big diamond-shaped bed in the centre, planted with *Dracænas*—nice, young, healthy plants some 2 to 3 feet high; the bed is well arranged, sloping on all sides, the soil being completely covered with *Selaginella Martensii*. Only the best varieties are grown, such as *metallica*, *Régina*, *Bausei*, *Cooperi*, *elegans rubra*, *Duffii*, a variety from Australia, with a short red leaf—very good and pretty; but the best of all is *Mrs. Hoskins*, a very fine thing. Its leaf is very dark, 8 inches broad, stiff, pendulous; it was found by his brother in the Fiji Islands.

The next most handsome bed is one 40 feet long by 12 feet wide—all *Crotons*—the best varieties. The plants look in splendid condition—they vary from 2 to 4 feet high; the soil, likewise, quite hidden by *Selaginella Martensii*, rises towards the centre of the bed. The varieties most represented are the best we have, but two or three are particularly fine. *Rubro-vittata* is one of the most striking, with a broad, red, jagged band down the centre of an almost black leaf. *Indian Prince*, with a long, narrow, curled, sub-pendulous leaf, 12 to 15 inches long, orange and black in colour, is also good, as is *The Czar*, and *Sir Ashley Eden*, another fine orange-tinted variety.

The other beds are a mixture, as I have said, of stove plants, all planted out. In the one nearest the office is a big bush of *Heliconia rosea striata*, with very pretty pink-lined foliage, nearly 6 feet high by 6 feet through, opposite a *Maranta Simonsi*, almost as big; close by is an *Alocasia gigantea* some 10 feet high, the hastate leaves being 4 feet long. Another peculiar *Alocasia* is one Mr. Chatterjee has obtained from Singapore; it is not handsome, but is strange, as it has on the lower side of the mid-rib of every leaf another small very well-developed leaf.

In the second bed are some good *Marantas*, *Aralia gracillima* several feet high, and therefore leggy; *Dracænas*, some dwarf *Panax*, such as *Victoriae multifida*, whilst the same large-leaved *Selaginella* runs all over the low rock-edging.

In another bed further down is a pretty variegated *Zingiber* by the side of *Z. D'Arceyi*—though not so highly variegated, it is a stronger grower. *Anthurium crystallinum* is very pretty, when it thus gets a chance of luxuriating planted out; *Piper ornatum* and some *Justicias* are also good.

In the third bed is a fine piece of *Stevensonia grandiflora*. *Cycas Rumphii* in another bed is good, with stronger, and broader foliage than *C. circinalis*. *Adiantum peruvianum* grows strongly, and *Pavetta borbonica* is at home. *Marantas* and other low-growing stove plants are numerous. In the bed at the end of the house, with water running through it, is a pretty *Dracæna umbraculifera*, and some fine *Calamus*, whilst at one end is a *Pritchardia grandis* 4 feet high in good condition.

Bearing to the right is a large enclosure, also under Oollu-grass—one walks from the show-house into this; here in long beds, edged with brick, stand hundreds of young *Crotons*, *Dracænas*, *Heliconia aurea striata*—rather green, however; *Ivory Palms*, 3 feet high—a reminiscence of *M. Schneider*; *Panax*, *Aralias*, including some young *A. Chabrieri*, a nice batch of *Dieffenbachia magnifica*, a few pieces of a new *Asparagus*, pretty, but I do not think it will prove so generally useful as those we have. From this house one passes into the Orchid-house, in the centre of which is a tank surrounded by four level stone-edged beds some 3 feet high, on which are plants. At both ends of the house are four big squares; these are filled with *Phalenopsis* suspended about 4 feet from the ground from iron wire stretched tightly across between iron uprights in each end of the bed. As all the plants hang exactly level the effect is very pretty; they are chiefly in low pans, wooden baskets being seldom used, and are potted in broken burnt brick and peat—no moss is used. In these four squares hang suspended several hundred *Phalenopsis grandiflora* and *P. Schilleriana*; the latter are good, nice, clean, healthy young plants, as are the majority, though not all of the former. *Cattleyas* and *Lælias* hang round the four sides of the house. On one of the stone beds close to the

bank are *Vandas*, chiefly tricolor and *cærulea*; on another is a fine batch of *Phaius grandiflorus*. Some *Dendrobium superbiens* suspended near are very good, having great, long, strong stems; so has *D. undulatum*—I measured some stems 4 feet long, fine healthy pieces. *Oncidium Kramerii*, amongst the *Cattleyas* on one side, looks well, and *Oncidium ampliatum majus* is healthy, making plump bulbs. It is from this house the Orchids are taken into the show-house, first described during the annual exhibition in March. Mr. Chatterjee tells me he sends a lot to England and Australia for sale by auction, and finds it pays him. A big *Ficus repens*, with leaves 3 to 4 inches long, covers the west side of this grass-covered house.

We then returned, and passed by the potting-shed to a very large house, 200 feet by 60 feet, just being built. It has low brick walls, but is to be covered with Oollu-grass (you will notice different grasses are used in different parts for this purpose). Down the centre runs a broad brick bed, on either side of which two narrower ones are in course of construction, with paths between; this makes five in all; a cross-path through the middle of the house divides these beds. There are several tanks being made, in which fountains are to be erected to run all day. Mr. Chatterjee buys his materials, and erects the house himself. When he is away the work stops; but it matters not—time is of no value. This house is parallel, and close to the house first described. The potting-shed leads into a pretty little fernery sunk below the level of the ground, reached by a few steps. Here are chiefly *Adiantum*, fresh and clean, with about as fine a batch of *A. Farleyense* as I have seen in India. Small *Aroids* are good, and a row of nice young *Phalenopsis Schilleriana* hangs on one side from the roof. Beyond this house is a row of frames for propagating purposes. Mr. Maries has the credit of having introduced these into India. Mr. Chatterjee tells me such things were unknown before.

The frames in question are of glass, 300 feet long, and contain newly-rooted cuttings, some just struck, of *Crotons*, foliage *Begonias*, store-pots of *Coleus*, *Caladium argyrites*, *Dieffenbachias*, *Alocasia Thibautiana*, *Cyrtodeira fulgida*, of a much richer colour than with us; there are also several pits of *Adiantum*.

Close by, outside, is a big piece of *Croton Kingianus*, some 9 feet high, only three years planted. It is very showy, with its large yellow variegated leaves.

Behind this *Croton* are some *Vanda teres* and *Renanthera coccinea*, the former 3 to 4 feet high, the latter with shoots 5 feet long. Mr. Chatterjee has seen a shoot 11 feet long. These are grown all the year round, outside, in full sun, on teak sticks; in the warm weather they receive water twice daily, but in the cold season only once. They flower well.

Behind the pits are oblong beds, leading up to a big pond opposite to the entrance to the grounds, though there is a fine stretch of grass between the gate and the pond. In the centre of these beds is a row of *Roses* in fair condition, with annuals on each side.

Crossing a small bridge, over the neck of another long pond, which runs up to the extremity of the grounds, one soon reaches the Palm-house, 100 feet by 50 feet, also under grass.

On one side of this bridge is a fine *Bauhinia*, several yards in diameter; whilst near the house is an exceedingly pretty flowering shrub, with very numerous four-lobed yellow blossoms, 2 to 3 inches in diameter—*Brunfelsia americana*. The contents of this Palm-house are chiefly *Areca lutescens* of all sizes—many hundred plants. Even at this moment Mr. Chatterjee tells me he has 300 out. These *Palms* stand in pots in squares, all ready for furnishing. A few *Kentias*, and a *Chamædorea* or two, were scattered about. In the centre is a raised stone circular tank, with some fine big pieces of *Asplenium nidus*, in big pots, on short supports, just above the water-level. Round the sides *Orchids* hang from the roof in considerable quantity. *Dendrobium aggregatum*, *nobile*, *fimbriatum*, *superbiens*, *chrysotoxum*, and *Farmeri*, were very good; as were several dozen *Phalenopsis Schilleriana*. At the end, and along the sides, placed on the ground within a low brick edge, were many hundred pots of Ferns, chiefly *Adiantum Collisii* and *A. tenerum*. I must not forget to mention, before reaching the Palm-house, a model plantation of *Mangos*, just put out, and classified according to Mr. Maries' work. Mr. Chatterjee has over 100 varieties, *James H. Veitch*.

(To be continued.)

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE, ACCUMULATED, RAINFALL, and BRIGHT SUN. Rows list districts 0-39 and their respective weather statistics.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending September 10, is furnished from the Meteorological Office:—

"The weather was generally cloudy in the western and north-western districts, with frequent, but mostly slight falls of rain. In the more southern and eastern parts of the Kingdom, the conditions were fairer and drier.

"The temperature was below the mean in all districts; in Ireland the deficit was only 1°, and in Scotland 2°; but, in England it ranged from 3° to 5°. The highest of the maxima were recorded at most stations on the 10th, and varied from 63° in 'Scotland, N.,' and 64° in 'England, N.W.,' to 70° in 'Scotland, E.' During the greater part of the week the daily maxima scarcely exceeded 60°. The lowest of the minima were registered on rather irregular dates; they ranged from 33° in 'Scotland, E.,' 34° in 'Scotland, W.,' and 35° over eastern and central England, to 40° in 'Ireland, S.,' and 46° in the 'Channel Islands.'

"The rainfall just equalled the mean in 'Ireland, S.,' but in all other districts it was less than the normal. Over eastern, central, and southern England, the fall was very slight.

"The bright sunshine was below the mean for the time of year over the Kingdom as a whole, but above it in 'England, N.E.,' and some parts of Scotland. The percentage of the possible amount of duration ranged from 22 in 'Scotland, N.,' 24 in 'England, S.W.,' and 25 in 'Ireland, S.,' to 37 in 'England, S.' and the 'Channel Islands,' 39 in 'England, N.E.,' and 40 in 'Scotland, W.'

MARKETS.

COVENT GARDEN, September 15.

MARKET quiet. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for Apples, Grapes, Kent Filberts, Lemons, Melons, Peaches, Pine-apples, and Plums.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various potted plants like Adiantum, Aspidistra, Feros, Fuchsia, Heliotrope, Begonia, Campanula, Chrysanthemums, etc.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for cut flowers like Arum, Asters, Carnations, Chrysanthemums, Cornflower, Eucharis, Gardenia, Gladiolus, Heliotrope, Lavender, Lilium, Maiden Hair Fern, Marguerite, etc.

ORCHID-BLOOM in variety.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing prices for various vegetables like Artichokes, Beans, Beet, Carrots, Cauliflowers, Cucumbers, Endive, Herbs, Lettuces, Mushrooms, Parsley, Shallots, Spinach, Tomatoes, Turnips, etc.

POTATOES.

Market not quite so firm. Arrivals much heavier. Buyer not anxious to buy; only from day to day. Prices, 60s. to 70s. J. R. Thomas.

SEEDS.

LONDON: Sept. 14.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with but little business done. Trifolium seems about used up; the demand during the last few days has improved. Winter Tares being very scarce, and much wanted, have advanced. Sowing Rye keeps reasonable. High prices are asked for this season's Italian Ryegrass. Samples of new Essex White Mustard are now coming to hand. Rape seed is obtainable at moderate rates. Bird seeds move off slowly at Monday's figures. There is no change to-day in either Buckwheat, Barley, or Linseed.

NOTICES TO CORRESPONDENTS.

* PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

ASPARAGUS PLANTS: W. W. Yea, they are easily transplanted if the operation be done just as growth has begun. The land should be heavily manured, and trenched during the winter, not necessarily throwing the bottom soil to the top, unless it be of good quality. If it be dug two spits deep, put rough half-decayed manure in the bottom of each trench, and a good layer of rich decayed manure between the top and lower spits. See that the drainage of the land is good.

BAD FLAVOUR IN GRAPES: C. T. We could detect none; indeed, they were very nicely flavoured.

BLISTER ON VINE LEAVES: D. R. No leaves were found in your letter.

CARNATIONS: G. S. The leaves are swarming with microscopic eel-worms, which are too common. The creatures are introduced in the soil, which should be turned out and the affected plants burnt.

CHRYSANTHEMUM BUDS: J. P. It is rather late to be "taking" the buds of Chrysanthemums. It will in this case be best to take off each shoot all the buds but the largest, whether terminal or lateral.

CHRYSANTHEMUMS: H. R. G. The flowers remain in their pristine leafy condition. We cannot assign any definite reason, but it is surely no matter for surprise that a plant treated in so unnatural a manner as a show Chrysanthemum is should occasionally resent the interference with its natural mode of life. From a florist's point of view, we share your disgust; from a physiological standpoint, we think them very interesting.

CHRYSANTHEMUM SPORT: J. T. Your sport from La Vierge is very pretty, and the colour is delicate. There are so many, we cannot say whether yours is better than any other, but we should deem it worth propagating.

ERRATA.—Figs: For Douro Nebra read Douro Sebra, and for D'Ager read D'Agén.

FERTILISED ODONTOGLOSSUMS WITH CŒLOGYNE CRISTATA: C. H. There is nothing unusual in an Odontoglossum plant carrying seed pods. You cannot be sure the contents of the pods are fertile seeds without testing them by sowing.

GARDENING DIRECTORIES: H. R. G. There are two published. One at 37, Southampton Street (Garden office), Strand, W.C.; another at 171, Fleet Street, E.C. (Journal of Horticulture office).

GRAPES: M. M. Spot: see our previous issue.

GRAPES DISEASED: Mountain Ash. The berries have begun to shank, although an examination of the roots showed that these were mostly healthy. A few small ones were dead. There has been some mismanagement, but what it is we cannot say.

GRAPES SHANKING: G. B. What causes this is a moot point, sometimes overcropping, robbing the Vines of much of their foliage whilst in full growth, loss of the finer roots from sour soil, or bad drainage. We cannot say, without knowing more about the Vines, what has caused it in your case.

GRAPE VINES: Epton. The check to growth which we mentioned may have arisen from a drop in the temperature, or from your saturating the border with cold water—manure or other. You seem to be treating your Vines as if they were voracious creatures, standing in need of blood, bones, guano, &c.; and they might, if the drainage were good, escape the probable evils of such a diet, and as it is not, the injurious effects of a bad state of the drainage are made the greater. Examine the roots, bringing them near the surface if deep in the soil; prune away all decayed or unhealthy roots, and as a beginning employ only good loam, lime rubbish, and broken bones.

LEAVES OF AQUILEGIA BITTEN OFF AND PLANTS DYING: W. R. F. The grub that you sent is probably the larva of the summer cockchafer, Melolontha solstitialis. They make perpendicular burrows in the earth, like the one that you found in the soil of the pot containing the plant with bitten-off leaves. The grubs find their food in the roots of plants, and we think that mice or birds may have bitten the leaf-stalks through. Your young Aquilegias may, in your dry gravelly soil, have dried from lack of moisture, the plants delighting in a soil that is moist. If you wish Aquilegias to do well in the border, prepare some stations for the plants by mixing a good proportion of heavy loam and burnt earth with the staple soil. These stations should have the soil thrown out to a depth of 1 foot; the soils well incorporated together and returned to the holes.

MILDEW ON PEACHES: J. D. There is nothing that you can do to save the fruit from loss this season. To prevent in the future the growth of mildew on the Peaches, limewash the walls of the peach-house, putting a quart of dissolved sulphur into each pailful of whitewash. After pruning the trees and burning all the trimmings, paint them with a mixture of clay, cowdung, lime, and sulphur; also use on the hot-water pipes the same sort of limewash as that put on the walls. Keep a little sulphur mixed to the consistency of mustard in saucers in various places in the houses during next season. Use in the water with which the trees are syringed some of the recommended anti-blight composition sold by nurserymen. Your endeavour should be to keep mildew out of the place.

MITES IN TURNIP SEED: Seedsman. If you were to put the seed into a close iron chest in the open air far away from dwellings and lights or fires, and then place bisulphide of carbon in a saucer on the top of the seed, shutting all up close, the vapour would descend, destroying all insect life without injuring the seed.

MOSS ON SOIL OF FERN SEED PANS: *Moss.* The Moss springs from the spores of Moss present in the peat, &c. Destroy these by baking, not charring it; then put it in a sack and bury it in the earth till moist enough for use. Scalding would have nearly as good an effect in preventing Moss growing as baking.

NAMES OF FRUITS: *G. S.* 1, Cellini; 2, Colonel Vaughan; 3, Early Julian; 4, Claygate Pearmain; 5, not known; 6, Gloria mundi.

NAMES OF PLANTS: *Jas. Cocker & Sons.* *Reseda alba*; a Mediterranean species long since introduced to gardens, and naturalised in the south of England and Ireland.—*An Old Reader.* *Mandevilla suaveolens.* It is rarely that the plant fruits so freely as yours seems to have done.—*C. W. D.* *Veronica exaltata.*—*B. L.* *Physostegia virginiana alba.*—*J. D. I.* *Coreopsis tinctoria*; 2, *Pyrus aria*; 3, *Hypericum Moserianum*?—*J. M.* 50, *Scolopendrium vulgare crispum*; 80, *A. Filix-mas paleacea*; 100, *Polyaticum Louchitis*; 120, *Athyrium Filix-femina Fieldia.*—*J. P.* *Sparmannia africana.*—*G. H. L. S.* *Cattleya granulosa var. Dubyssoniana.* The lip of the *C. aurea* is unusually dark, and the flower of *C. aurea* a very good one.—*M. K. I.* *Davallia canariensis*; 2, *D. (Leucostegia) immersa*; 3, *Cypripedium* sp. probably; 4, *Dasylium acrotrichum*; 5, *Croton Weissmannii*; 6, *Croton*, one of the numerous garden forms.—*W. P.* *Crithmum maritimum lioni* *Daveauana*; 3, *Begonia nitida alba*; 4, the *Abutilon* is very pretty.—*H. R. G.* 1, *Samphire.*—*T. C. S.* *Polmont.* 1, *Oats*; 2, *Pel-Caladium Beethoven*; 3, *C. Chantini*; 3, *C. Prince Albert Edward*; 4, *Ilibiscus Rosa-sinensis*, fl.-pl.; 5, *Oncidium flexuosum*; 6, *Salvia splendens*; 7, *Jasminum grandiflorum*; 8, *Caryota urens.*—*J. P.* *Aristolochia grandiflora*, *Stapelia patula*, figured in *Hook. Ic. Plant.*, 1914.—*W. J. P.* *Nicotiana glauca.*

NEW VARIETIES OF PINKS. *H. E.* Your seedlings from Pink Mrs. Sinkins are fine things, and blooming at this late part of the season, they are doubly welcome.

PEACHES: *C. W. H.* Smashed in transit, owing to bad packing.

PRICE LISTS OF CUT FLOWERS: *E. N.* We know of no such lists.

RATING OF NURSERIES: *W. F. Boff.* Apply to the gentleman whose letter on the subject we published last week. In these cases it is always cheaper in the end to seek the best legal advice.

SCUM ON POND: *J. P.* The overflow of your pond should have a so-called frog's-mouth. The water would then, when it was driven that way by wind, lave the edge, provided the pond is full, carrying the scum away into the outlet. Failing such a contrivance, it can be drawn to the side with a long piece of scantling, having a rope attached to each end.

SIX VARIETIES OF PEACHES AND TWO NECTARINES FOR HOUSE FORCING: *Anxious.* Peaches: Alexander, Hale's Early, Early Grosse Mignonne, Grosse Mignonne, Noblesse, and Bellegarde; Nectarines: River's Early and Spencer.

STEPHANOTIS GRANDIFLORA: *Latter.* It is not at all rare for this plant to bear seed-pods.

TOMATOS: *C. B. & G.* Very nice, but we have tasted better.

TRANSPLANTING ROSES IN A HOUSE: *G. H.* The end of the month of October, or even earlier, if the growth is well ripened. If the operation be carefully done, there should be no injury to the early spring blooming of the plants. Lift them with all their roots intact; prune back the strongest of these to half their length; and plant again very firmly in rich loamy soil; afford a good watering, and if the remaining foliage should flag, syringe it once daily, and afford a little shade when the sun is hot.

PHOTOGRAPHS RECEIVED, WITH THANKS.—*J. U.*—*W. C.*, Madresfield.—*T.*—*H. B.* (with thanks).

THE BED BUG, in hot weather, he's about.
To quickly and permanently rid your beds of Bugs, mix small box of "ROUGH ON RATS" thoroughly with a quarter pound of lard, or other grease; with this mixture fill all holes, openings, cracks, and crevices in the bedstead. This method never fails; effective and lasting. Cut this out. "ROUGH ON RATS" is in 7½d. and 1s. boxes at Chemists.

The GREATEST NOVELTY of the AGE!

SAM DEARDS' PATENT SELF-WATERING SHELF FOR PLANTS ON SHELVES.

Now on view at Stand 11, Block A, Horticultural Exhibition, Earl's Court, S.W.

ITS ADVANTAGES ARE—

- 1st.—No waste of water, all water being absorbed by the plants.
- 2nd.—Saving of three-fourths of the labour in watering.
- 3rd.—The plants are watered more naturally than by any other method.
- 4th.—All drip and water dropping from shelves to plants beneath entirely prevented.
- 5th.—Not a drop of manure-water is lost, all being absorbed by the plants.
- 6th.—A boy can do the work of a man.
- 7th.—A row of plants 100 yards long can be watered without walking a yard to do it.

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.*

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—*The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.*

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON ST., STRAND, W.C.

PARTNERSHIP.—Advertiser (age 30) seeks PARTNERSHIP in a well-established Nurseryman and Florist's Business, in or near a good Town, within easy reach of London.—Particulars to S. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

JOHN HORTON begs to THANK the APPLICANTS for the Pleasure Ground FOREMAN'S PLACE, and to say that it is FILLED. Original testimonials will be returned.—Welbeck Gardens, Worksop, Notts.

WANTED, MANAGING FOREMAN (with a view to Partnership, and ultimate succession), in a small healthy Business devoted to the Sale of Hardy, Herbaceous, and Alpine Plants, in a central populous neighbourhood, where there is a good connection. Must have command of from £200 to £300.—*CALTHA, Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a HEAD-WORKING GARDENER, October 1; Denbighshire; age 30 to 40, married; good character. Two men under. Must thoroughly understand Vines, Peaches, Flowers, Vegetables, &c. Wages 23s. per week with Commission on Sales, worth £4 to £5 per annum.—Apply, with full particulars and copies of testimonials, N. Messrs. Street & Co., 30, Cornhill, London, E.C.

WANTED, AT ONCE, a WORKING FOREMAN, for an Outdoor Nursery, with a thorough knowledge of Roses, Fruit Trees, and general Nursery Stock; capable of taking charge of men.—Apply, stating wages and references, to W. BALCHIN AND SONS, 87, Western Road, Brighton.

WANTED, a MARRIED MAN, thoroughly well up in the work of a small Nursery, Inside and Out. Must be energetic, handy, and obliging. Cottage on Premises.—W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a young MAN, to take charge of a few Glass-houses. Must be competent to grow Grapes, Pines, Melons, Cucumbers, Mushrooms, Tomatoes, and Stove and Greenhouse Plants, especially Chrysanthemums.—References, wages required, and any other particulars to F. HUGHES, The Gardens, Overbury Court, Tewkesbury.

WANTED, a sober, steady MAN, thoroughly experienced in Mushroom Growing Outdoors.—Apply H. BAKER, Stand 37 and 38, Covent Garden, W.C.

WANTED, a young MAN, for the Soft-wooded Department; one used to a Market Nursery preferred. State experience, and wages expected, to W. FROMOW AND SONS, Sutton Court Nursery, Chiswick, W.

WANTED, as GROOM and UNDER GARDENER, a married Man, without young children, willing to be useful. Cottage found.—ELTHORP, Gerrard's Cross, Bucks.

WANTED, as an IMPROVER, a young MAN who has been accustomed to Greenhouse and Propagating Work. State age and experience, also wages required. A reference expected.—Apply to Messrs. GEO. JACKMAN AND SON, Woking Nursery, Surrey.

Seed Trade.

WANTED, for London Warehouse, strong, active, well-educated Youth, having four to six years' experience; exceptional references necessary. State particulars, age, and wage required, to R., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

THOMAS BUTCHER can recommend several HEAD and UNDER GARDENERS of first rate character and proved ability. Gentlemen seeking such may have particulars free.—Apply to THOMAS BUTCHER, Seed Merchant and Nurseryman, Croydon.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

F. SANDER AND CO. can recommend several highly qualified and energetic **HEAD** and **UNDER GARDENERS**, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
F. SANDER AND CO., St. Albans.

GARDENER and BAILIFF (WORKING).—Situation wanted as above, on a Gentleman's place. Practical Gardener, Farmer, and Fruit Grower. Kent, Surrey, or Sussex, preferred.—W., 203, Parrock Street, Gravesend.

GARDENER (HEAD).—Mr. WARD, Head Gardener to the Right Hon. the Earl of Radnor, Longford Castle, Salisbury, will be pleased to recommend a man of excellent character as above.

GARDENER (HEAD).—Married, no family; thorough practical knowledge of his profession in all its branches. Good character.—A. B., The Lodge, Sunnyfield, Hampstead Heath, N.W.

GARDENER (HEAD).—Age 30; thoroughly experienced in Vines, Peaches, Melons, Early and Late Forcing, Stove, Orchids, Greenhouse, Flower and Kitchen Garden. Highest reference. Circulars objected.—GARDENER, The Grove, Staple Wingham, Kent.

TO FLORISTS, &c.—Re-engagement wanted by a young Lady in a Florist and Retail Seed Shop.—Apply by letter, to FLORIST, 16, Western Street, Belford.

HOLLOWAY'S OINTMENT and PILLS.—Much watchfulness must be exercised at the present time, and the earliest evidences of ill-health must be immediately checked or a slight illness may result in a serious malady. Relaxed and Sore Throat, Diphtheria, Quinsy, Coughs, Chronic Cough, Bronchitis and most other pulmonary affections will be relieved by rubbing this cooling Ointment into the skin as near as practicable to the seat of mischief. This treatment, so simple and effective, is admirably adapted for the removal of these diseases during infancy and youth. Old Asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have brought round many such sufferers and re-established health after every other means had signally failed.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with 17½ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, The Loughborough Park Nursery, Brixton, S.W., five minutes' walk from the Loughborough Park Railway Station, on FRIDAY, October 7, at 12 o'clock precisely, in consequence of the number of Lots, 7000 Variegated and Green Euonymus, 4000 oval-leaved Privet, Evergreen and Flowering Shrubs in great variety, large quantities of Forest Trees, 5000 Aucubas, 2000 Ivies in Pots, 2000 Standard and Young Mulberries (a special feature at this Nursery), 500 Ampelopsis Veitchii, and other Hardy Climbers in Pots, 700 fine Standard Planes and Limes, 5000 Palms in variety, in 32, 48, and 60-pots, consisting of Kentias, Latamias, and others, Azaleas, Camellias, a number of Specimen Plants, suitable for Furnishing, Shrubs in Pots for Window Decoration, and other Stock.

May be viewed one week prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheap-side, London, E.C.

Woking, Surrey.

A short distance from the Woking Railway Station.

UNUSUALLY IMPORTANT FIVE DAYS' UNRESERVED SALE

Of exceptionally well-grown and rooted NURSERY STOCK, in the finest possible condition for transplanting, and embracing the most important lot of Stock offered by Auction for many years, the quality of which is unsurpassed in the Trade, by order of the Trustees of the late Mr. George Jackman, the land being required for Building.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the Woking Nurseries, Woking, Surrey, on MONDAY, October 10, and four following days, commencing at 12 o'clock precisely each day, several acres of exceptionally well-grown

NURSERY STOCK.

The whole of which is in the best possible condition for removal; comprising—

10,000 CONIFERS, 3 to 9 feet, amongst them numerous fine specimens.

Thousands of smaller EVERGREENS and CONIFERS, for Potting, &c. 1000 BOX, in variety. 10,000 Green and Variegated HOLLIES, 1 to 5 feet. 3000 LAURELS, of sorts, 1 to 5 feet. PORTUGAL LAURELS. 5000 Named RHODODENDRONS, Hybrids, &c., 1 to 3 ft.

A fine collection of ORNAMENTAL DECIDUOUS TREES, comprising Maples, Thorus, Almonds, Peaches, Planes, Poplars, &c., 7 to 10 feet.

1000 LIMES, 5 to 10 feet. FOREST TREES in great quantities; amongst them several thousands of Sycamores, Oaks, Beech, Spruce, Limes, Poplars, &c.

5000 Common ASH, 2 to 5 feet. 40,000 QUICK, 1 to 2½ feet. 20,000 ST. JOHN'S WORT.

A splendid collection of ORNAMENTAL TREES, for Park and Avenue Planting, 10 to 20 feet, including Horse Chestnuts, Purple Beech, Scarlet Oaks, Lume-, Planes, Sycamores, Maples, Elms, Poplars in variety, &c.

25,000 FRUIT TREES, comprising Standard, Feathered, and Single Cordons, Apples, Pears, Plums, and Damsons. 3000 Standard and Feathered Flowering Almonds, Peaches, Prunus, Pissardi, and other Stock.

The Auctioneers have personally inspected the Stock, and desire to call the attention of intending purchasers to this important Sale. It is undoubtedly the most important Auction of Nursery Stock held for many years, and an inspection will well repay a visit by those contemplating planting during the season.

May be viewed any day (Sundays excepted) prior to the Sale. Catalogues may be had on the Premises, or of the Auctioneers, Land Agents, and Valuers, 67 and 68, Cheap-side, London, E.C.

Chilwell Nurseries, Chilwell, Notts. **MESSRS. PROTHEROE AND MORRIS** are instructed by Messrs. J. R. Pearson & Sons to SELL by AUCTION, on the Premises as above, on THURSDAY, October 6, at 12 o'clock precisely, a large quantity of GENERAL NURSERY STOCK, recently transplanted and beautifully grown, including 1000 splendid Golden Yews, 1 to 4 feet, every one a perfect specimen from ground to point, and as much through the base as they are high. The whole will be sold absolutely without reserve, as the ground is to be sold immediately after possession in March.

Special trains run to Nottingham from all parts of the kingdom on day of Sale, it being the celebrated Goose Fair. Beeston Station for the Nurseries is 3½ miles from Nottingham. May be viewed. Catalogues may be obtained on the Premises and of the Auctioneers.

Cliffe, near Rochester.
 IMPORTANT TO FRUIT-GROWERS, MARKET GARDENERS, AND OTHERS.
 GREAT ANNUAL SALE, by order of Mr. W. Horne, MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, on the Premises, Cliffe, near Rochester, on WEDNESDAY, October 26, 100,000 FRUIT TREES, comprising 35,000 one, two, and three-year-old Apples, Pears, Plums, and Cherries; 1000 Lady-Sudley and Bi-marek Apples; 5000 of the new dessert Apple, Beauty of Bath; 50,000 Baldwin Black Currants, 4000 Red Currants, 10,000 Bob and Lad Gooseberries, 5000 John Ruskin Strawberries, also Noble, and other varieties, in large and small pots; 45,000 Paxton, Noble, and John Ruskin Strawberries, from open ground; 20,000 three-year-old Conover's Colossal Asparagus roots, from French seed; 50,000 early Rainham Cabbage plants, &c.
 May be viewed. Catalogues may be obtained on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Worcester.
 FIVE DAYS' ABSOLUTE CLEARANCE SALE of about 20 Acres of beautifully-grown NURSERY STOCK, carefully prepared for removal, by order of Messrs. Richard Smith & Co., a portion of their land in the City boundary being required for Building purposes.
 Important to Noblemen, Gentlemen, Land-cape Gardeners, Nurserymen, and others engaged in Planting.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, on the Premises, the St. John's Nurseries, Worcester, about 20 minutes' walk from the Worcester Railway Station, on MONDAY, October 17, and FOUR FOLLOWING DAYS, at 12 o'clock precisely each day, without reserve—

25,000 STANDARD and PYRAMID ORNAMENTAL TREES, 4 to 18 feet, in great variety; 2000 Prunus Hispania; 3200 Purple Beech, best dark-leaved variety; 500 London Planes.
 5000 FLOWERING SHRUBS in great variety.
 12,000 SPECIMEN CONIFERS and EVERGREENS, 1 1/2 to 12 feet high; 2000 Portugal Laurels; 1600 Gold and Silver Variegated Hollies, standards and Pyramids; 2500 Gold in Yews, grand plants.
 Large quantities of fine Native LARCH, 2 to 4 feet.
 Ash, Quack, and other FOREST TREES.

Thousands of FRUIT TREES, including Standard and Pyramid Pears, hundreds of Standard Victoria Plums, grand trees; Standard and Pyramid Damsons, Standard and Pyramid Apples, Black and Red Currants, Whinham's Industry, Kepp-sake, and other popular Gooseberries.
 Several hundreds of fine Planting and Fruiting VINES.
 Forcing ASPARAGUS.
 Thousands of TEA and NOISETTE ROSES, in pots, embracing the most popular plants.
 Thousands of CLIMBERS, consisting of 1000 Clematis Jacquemanti, 1000 Clematis in variety.
 Berried AUCUBAS, in quantity, and other Stock.
 Also 8 two-wheel TRUCKS, and 1 smaller do., suitable for Nurserymen and others.

The Auctioneers desire to call special attention to this highly important Sale. It is the first occasion on which an Auction has been held at these celebrated Nurseries, the necessity now arising solely on account of a portion of the ground having to be given up for building purposes; and the present Sale affords an exceptional opportunity to Noblemen, Gentlemen, and others desirous of acquiring large quantities of well-grown Nursery Stock.
 Purchasers may arrange with Messrs. Smith & Co. to have their lots lifted and forwarded at the cost of labour incurred and material used. Luncheon provided each day at 11.30.
 The Stock may be viewed any day prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers, Estate Agents, and Valuers, 67 and 68, Cheapside, London, E.C.

 On WEDNESDAY, September 28, at 12 o'clock.
 IMPORTANT PUBLIC SALE OF ORCHIDS.
 By Order of Messrs. Charlesworth, Shuttleworth, & Co., Heaton, Bradford, and 213, Park Road, Clapham, London, S.W.

MR. WALTER J. BUCHANAN has been favoured with Instructions to SELL by PUBLIC AUCTION, as above, a Choice Collection of Semi-Established and Established ORCHIDS. A good many will be found in Spike or Sheath, for Winter or Early Spring Flowering.
 Special attention of Connoisseurs is drawn to the fine lot of New, Superb LÆLIA GRANDIS TENEBROSA, a first-class novelty which ought to be in every collection.
 On View Day previous, from 12 till 5 o'clock, and on Morning of Sale.
 Full particulars in Catalogues, to be had on application to the Auctioneer, 72, Renfield Street, Glasgow.

WANTED, a HOUSE, with six to eight rooms, standing in 1 to 4 Acres of Ground, suitable for Hardy Plant Growing, within 10 miles of London. Send full details to HILL, Seed-man, 1A, Easton Road, King's Cross, London.

GARDENER, with insight of Market Work, is open to TAKE OVER a SMALL CONCERN, or PREMISES suitable for the same; or PARTNERSHIP.
 Address, ADAMS, Browsea Island, Poole, Dorset.

MR. THOMAS B. JAMES has for SALE, by Private Treaty, several NURSERIES and FLORISTS' BUSINESSES, both in the Midlands and in the Suburbs of London. Particulars on application.
 N.B.—Sales conducted and Valuations made in any part of the country (twelve years' practical experience).

NURSERY and FLORIST.—Great Bargain!
 Established 20 years. Four Glass-houses, 1 1/2 acre of Ground, and eight-roomed House, Rent £18. Lease, Plant, and Stock at valuation. No Premium. Call at once.
 BEVANS, 16, Laurence Pountney Lane, E.C.

Public Sale of Large Camellia Plants.
TO BE SOLD, Without Reserve, at Lansdowne, near Phila., U.S.A., on TUESDAY, November 1, about 250 CAMELLIA PLANTS, in fine health, from 1 to over 3 inches diameter of stem—Alba plena, Fimbriata, Lady Holme's Bush, Henry Le Favre, &c. As Camellia plants do not fail to throw up shoots, if cut down even to short stumps, these can be reduced to small compass for shipping—sure to live, if properly handled. Every plant will be Sold, Without Reserve, no matter how small the figure, as the place is sold, and the house above them taken down.
 A. L. PENNOCK AND SON, Lansdowne, Delaware Co. Pa., U.S.A.

To Nurserymen, Florists, &c.
SUBSTANTIAL NURSERY PREMISES to be DISPOSED OF, by Executors, constructed at great cost, at a small nominal premium. The Premises are in working order, and comprise Greenhouses, Dwelling-house, Gardener's Cottage, Stabling, &c. About 6 miles from Covent Garden, London.
 Particulars will be furnished upon application to A. Z., 2, Wistaria Road, Lewisham, S.E.

FOR SALE, a compact, attractive, old-established NURSERY, SEEDSMEN, and FLORISTS' BUSINESS (including Retail Shop); several Greenhouses, comprising 4000 square feet of glass, well-heated, &c. Magnificent opportunity. Only Nursery in seaside town of 40,000 inhabitants. Within easy run of London.—For full particulars apply to L. M. N., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

Truro, Cornwall.
GENERAL NURSERY BUSINESS for DISPOSAL (established 50 years). The ground is fertile, well sheltered and watered, in good heart and condition, easily accessible, 7 acres in extent, one of which is enclosed with a large brick wall for the cultivation of Fruit. There is a good Cottage, 7 Glass-houses, Packing Sheds, Frames, &c., on same; also a magnificent stock of Shrubs, Fruit Trees, Roses, Decorative Plants, Cut Flowers, &c. The whole of same to be taken at a valuation. The above affords an excellent opportunity to an experienced and energetic man for acquiring a successful business undertaking.
 Apply to GEO. STANAWAY, Accountant, Truro.

To Nurserymen, Florists, and others.
TO BE SOLD, in Acre or larger Plots, excellent LANDS at Enfield Highway, a few yards from the Brimsdown and Ponder's End Stations, and adjacent to the line of the Great Eastern Railway. Adjoining land is extensively cultivated by florists of repute; a considerable portion of the purchase money can remain on mortgage at low interest. Particulars of Mr. ALFRED RICHARDS, Estate Agent, Lower Tottenham.

FELTHAM.—Valuable Freehold ESTATE, comprising nearly 20 acres of Market Garden Land, with substantial Residence, Home-stead, and Farm Buildings, for SALE by Private Treaty.
 For particulars apply to Messrs. S. WALKER AND RUNTZ, 22, Morgate Street, E.C.

To Nurserymen and Florists commencing Business.
HAMPTON-ON-THAMES, on the Marling Park Estate, free from London fogs, a deep rich loam, the favourite neighbourhood for Growers. FREEHOLD LAND for SALE, on easy system of Purchase, or to be LET on Lease.
 For full particulars apply to Mr. FRED. G. HUGHES, Surveyor, The Estate Office as above.

To Nurserymen.
TO BE LET or SOLD, a convenient NURSERY GROUND, with two large Greenhouses, Boiler-house, and Ornamental Pond, in all about 4 Acres, half under cultivation. Room for dwelling-house, near railway station, close to good main road; within 5 miles of Bristol. Stock on ground to be taken at valuation
 Apply, CLEMENT GARDINER, 14, John Street, Bristol.

TO LET, in Kent, a small **NURSERY**, about 2 acres of good, rich, cultivated Land, with Glasshouses, heated with Hot-water. About 15 miles from London; 1 mile from station. For particulars apply to W. B., "The Orange Tree Tavern," Wilmington.

VICTOR POTATOS
(SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatos have become discoloured and unsaleable.
The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.
Price per cwt. and ton. State requirements to
W. W. JOHNSON & SON,
Seed Growers and Merchants, Boston, Lincolnshire.

FERNS A SPECIALITY.
A magnificent stock of Stove, Greenhouse, and Hardy Ferns, in 1400 species and varieties. CATALOGUE free on application. The most beautiful and complete
ILLUSTRATED CATALOGUE of FERNS
(No. 22), ever published. 2s. post-free.
It contains 150 Illustrations, and an immense amount of interesting and instructive matter of great value to all Fern Cultivators.

HIGHLY IMPORTANT SALE

OF

ESTABLISHED and SEMI-ESTABLISHED

New, Rare, & Beautiful Orchids

By Order of Messrs. LINDEN, Brussels.

AMONGST WHICH WILL BE FOUND

THE LARGEST AND FINEST PLANTS IN EUROPE OF

CATTLEYA REX.

Also 100 superb plants of

LÆLIA GRANDIS TENEBROSA,

The new and exquisite ONCIDIUM BUNGEROTHI.

Also a magnificent lot of new varieties of CATTLEYA ACKLANDIÆ.

The entire stock of the new and splendid

CYRTOPODIUM ALICIAÆ, LINDEN,

(H.S. Princess of Monaco New Cyrtopodium).

Exhibited at the last meeting of the Royal Horticultural Society.

Also beautiful plants of the new and chaste

MILTONIA CLAESIANA;

excellent plants of VANDA SPECIES, and good plants of

ODONTOGLOSSUM CORONARIUM; SOBRALIA LILIASTRUM (imperatrix); ANGULOEA EBURNEA (true); NANODES MANTINI (new); ONCIDIUM CRISTATUM (new); BULBOPHYLLUM ANCEPS (new), &c. All in magnificent condition.

To be SOLD by AUCTION, on FRIDAY NEXT,
September 30, by

MESSRS. PROTHEROE & MORRIS,

AT THEIR

CENTRAL AUCTION ROOMS,

67 and 68, CHEAPSIDE, LONDON, E.C.

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 24, 1892.

COMBERMERE ABBEY.

IT is a trite repetition of a *vérité banale* to say that the monks of old nearly always founded their abbeys where the land was fatter, and where there was at hand an abundant supply of flesh, fish, and fowl. Combermere, in Cheshire, is a good instance of this way of theirs. The face of the country all round is thickly wooded, and the billowy park-land is covered with a rich, luxuriant herbage of emerald hue; and the mere, from which the place takes its name, is a very large stretch of water, 130 acres, of great depth, and 5 miles round. The abbey belonged to the Cistercians, and was founded in the twelfth century. On the dissolution it was given by Henry VIII. to Sir George Cotton. As Henry was an unerring judge of men, he probably deserved the magnificent gift. Leland speaks of him as a type of all gentlemanly virtue and charity. Of the original building some parts still remain, the library being the old refectory. This library is a most gorgeous room with a groined roof, and the heraldic history of all the Cottons emblazoned on shields. The hall or armoury, an equally fine room, is filled with trophies brought home from India and Waterloo by the greatest of the family, the first Viscount Combermere, the "Hero of Bhurtpore." This place was believed to be impregnable, the mud walls being of enormous thickness, and the position very difficult of approach. The legend prevalent was that it could only be taken by a crocodile, and as "comber" means crocodile in Hindustani, he fulfilled the prophecy. In addition to this brilliant exploit, he served all through the Peninsular War and at Waterloo, and was one of the Duke of Wellington's most trusted friends and generals. The services he rendered in making the raw English cavalry fit to cope with the veteran French cavalry, were of inestimable service to us in the war. The two inns on the estate keep his memory green in the minds of the villagers, one is called "The Bhurtpore Arms," and the other "The Salamanca."

The glory of Combermere is the lake or mere. It is the finest sheet of water in any park in England: from the abbey it presents the appearance of a mighty river. Its beauty is greatly enhanced by the varied nature of the surroundings. At the end nearest the abbey there is a woody island, affording a double passage to a chain of smaller lakes, where the Cumber stream enters. Opposite the abbey, verdurous park-land gradually rises to grand old trees in the distance. Lower down, thick woods, into which incurve many pretty coves and bays, line both banks; and at the further end the mere narrows to a bridge, where a thick growth of shrubs, chiefly Dogwood, clasps lovingly the water's edge. Beyond this, again, it opens out

into a smaller lake, from which a stream is fed by a sluice. The divers moods of this beautiful inland sea are very fascinating to watch. Today a strong wind veers round constantly, and the waves and the reeds chase one another now in this direction, now in that: to-morrow there will only be, perhaps, a gentle zephyr, and the ripples will dance and laugh in the sunlight. In the moonlight a silver har crosses the lake as on a heraldic shield. The great size of the mere, its remoteness from any haunt of men, the quantity of weeds and reeds, and the fact of their being unmolested, makes it a favourite home for rare migratory birds. The great-crested grebe may be seen diving and bringing up little fish or water insects for its young. The grebes breed in the rushes, and only the male migrates, the female and the young stopping all the year. Flocks of the cravat goose (*Anser canadensis*) fly over the lake, uttering their shrill cry. Other rare visitors are the golden-eye duck, also called the bell duck, because of the sound made by the first five primary feathers, resembling the tinkling of small bells; the bittern, and the gooseander. Coots, of course, are numerous. Herons are common, and also breed there; one bay, surrounded by high trees, called Heron Bay, cannot be rowed into without flushing three or four of these unwieldy birds—at least, unwieldy till they get on the wing.

Fish swarm in its waters. A few trout come in, but the pike do not allow them to increase. Eels abound; they are of different colours, according to the depth of the water in which they may chance to be. At the sluice there is an eel-trap, and when there is an "eelfare," hundreds are caught in the trap.

The park is one of those typical old-English parks one sees nowhere else than in England. The ground is undulating with dense darkling woods in the background, and studded with Oaks, Chestnuts, and the other usual trees. A great many of the Oaks are of enormous size, and some of the old ruins were very picturesque. The largest is 29 feet 2 inches, another was 28 feet 4 inches, and on the island was one that was 26 feet. The measurements were taken about 3 feet up, taking care to choose a place where there are no knobs or bosses. The walk round the lake through the woods is very lovely; so beautiful, indeed, that the dullest lover of nature could not fail to be aroused to some enthusiasm. It is a great hunting ground for wild flowers. Balsam, Impatiens Noli-me-tangere grows very lustily, and covers great parcels of ground, and the erect *Lysimachia* does the same.

There is no flower garden near the house, it would be out of keeping with the abbey-like character of the place. The pleasure grounds extend to the kitchen garden, which is some distance from the house. They consist of walks through a lawn interspersed with shrubberies and Coniferous trees. Some of these are quite notable specimens. A *Libocedrus* decurrens must be nearly, if not quite, the highest and best furnished in the country; it is known to have been planted within a year of its introduction. *Taxodium distichum*, *Sequoia Wellingtonia*, *Araucaria imbricata*, together with the Himalayan Spruce and Pine, are all in perfect health, and show no signs of suffering from our cold winds. Combermere, too, can probably boast of having what is probably the biggest Portugal Laurel to be seen anywhere; it must be 200 years old at least, and has re-rooted all round in every direction. It took 114 long paces to walk round it, and in places it is 30 feet high; it has the appearance from the distance of a large clump of shrubs, and one

is very surprised to find that it is only one Laurel. Opposite this Laurel on the other side of the walk is a fine wide-spreading Fern-leaved Beech, trailing its lower branches on the earth, and also covering a large circuit of ground. The delicate crimpling of the leaves, and their green-brown colour, makes this tree very conspicuous. The two sides of the kitchen garden outside the walls are devoted to a long herbaceous border, and to an avenue of Arbor-vitæ. This avenue is about 130 yards long. As it was planted a long time before Mr. Owen, the gardener's time, who has been there thirty-four years, the component trees have reached a goodly height, and bid fair in years to become much more imposing still. As the kitchen garden is not kept up as it formerly was, this description of the pleasure-grounds must bring this incomplete description to a close. *Vagabond*.

NEW OR NOTEWORTHY PLANTS.

NEW ORCHIDS.

THE third decade of new Orchids, described by Mr. Rolfe in the September number of the *Kew Bulletin*, consists of the following species, which, with one exception, are in cultivation in the various European collections:—

1. *Pleurothallis stenosepala*.—A species allied to *P. cardium*, Rehb. f., but differing in its much longer and narrower light green sepals. It has flowered at Kew, and with R. J. Measures, Esq., Cambridge Lodge, Flodden Road, Camberwell. The petals are also light green, and the lip light brownish-buff (p. 208).

2. *Lepanthes gracilis*.—A graceful little species, which recently flowered at Kew from some unknown source. It has bright yellow flowers, with some purple on the petals and column. It is allied to *L. concinna*, Sw. (p. 208).

3. *Restrepia bidentata*.—A remarkable little plant, which flowered in the Glasnevin Botanic Garden, differing from every other in having a pair of stipule-like teeth on the petals. The flowers are small, and variegated with brownish-purple and yellow on a paler ground. Its habitat is not known (p. 208).

4. *Carlogyne flexuosa*.—A Javan species, which has recently flowered both at Glasnevin and Kew. It belongs to Lindley's group, *Flexuosæ*, and is characterised by its hexangular ovary. The flowers are white, with a yellow stain on the lip (p. 209).

5. *Epidendrum bituberculatum*.—A species allied to *E. Schomburgkii*, Lindl., but with smaller rosy-purple flowers, and a pair of yellow calli at the base of the lip. It flowered in the collection of Sir Trevor Lawrence, Bart., M.P., at Burford Lodge, Dorking. Its habitat is not recorded (p. 209).

6. *Maxillaria glumacea*.—A brilliant species, allied to *M. aciantha*, Rehb. f., and *M. coriacea*, Rodr., characterised by its glume-like, acute, rigid sepals, which, with the petals, are yellowish-green in colour, and the lip maroon-purple, blackish-brown, and yellow. The scapes are clothed with imbricating sheaths (p. 210).

7. *Aspasia Barclayi*.—A small species, which flowered with W. L. Barclay, Esq., of The Briars, Reigate. It is allied to *A. principissa*, Rehb. f., and *A. psittacina*, Rehb. f. The segments are pale yellow-green, with somewhat darker bands, and the lip white, with some light purple and yellow near the base. Its habitat is not recorded (p. 210).

8. *Oncidium cristatum*.—A Brazilian species, which flowered with Messrs. Linden, L'Horticulture Internationale, Brussels. It has a somewhat twining scape, like *O. Schillerianum*, Rehb. f., and *O. vulvoo*, Rehb. f., to which it is allied. The narrow reflexed sepals and petals are of a clear, bright yellow, with darker lip and column-wings, the former having some red-brown dots on either side of the crest (p. 210).

9. *Cypripedium pusillum*.—A curious little species near the Californian *C. fasciculatum*, Kellogg, believed to be a native of Florida. It has a pair of elliptical-oblong leaves, and a short raceme of light yellow flowers, with some brownish-purple veins. It recently flowered at Kew, and with H. J. Elwes, Esq., of Cirencester, and Messrs. F. Sander & Co., of St. Albans (p. 211).

10. *Cypripedium Henryi*.—A Chinese species of the *Foliosæ* section, allied to the Himalayan *C. cordiferum*, Don, but with flowers in racemes, and other differences. It is described from dried specimens, collected by Dr. Aug. Henry, but the flowers are believed to be greenish-yellow, with a paler lip. It is not in cultivation (p. 211).

AGAPETES MANNII, Hemsl., n. sp.*

This, like the closely-allied *Agapetes obovata*, belongs to a section of the genus having comparatively small, inconspicuous flowers, and small crowded leaves, similar to those of many of the *Vacciniums*. Both are natives of the mountains of Northern India, and when growing in masses, and full of flower, are very attractive, though the individual flowers are only about half an inch long. *Agapetes obovata* flowered at Kew in 1886, but the fact does not appear to have been recorded previous to this. Probably it was not considered sufficiently ornamental to deserve that distinction. Indeed, a small plant with a few flowers on it, such as I have before me of *A. Mannii*, would not be admitted in a greenhouse devoted to showy plants. Nevertheless, plants of it may have been distributed, therefore it may be well to point out the principal differences.

Agapetes obovata is a dwarf, densely-branched shrub, with scurfy branchlets, thickly set with coriaceous, obovate leaves, about half an inch long, and solitary flowers about a third of an inch long, borne on stalks scarcely so long as the leaves. The "reddish-brown" corolla is ventricose, and scarcely longer than the exerted anthers. *Agapetes Mannii* differs in having almost glabrous branchlets, lanceolate leaves, and white flowers, half an inch long, with a cylindrical corolla, and slightly exerted anthers.

Agapetes Mannii is a native of the Khasia hills, and living plants of it were sent to Kew with various Orchids, including *Dendrobium Williamsonii* by Mr. Gustav Mann, early in 1889. It gives me much pleasure to attach the name of my old friend to this plant, a native of the country where he spent at least a quarter of a century of his life in the forestry department, after a most successful botanical expedition in the unhealthy regions of western tropical Africa.

According to notes accompanying some of the dried specimens in the Kew Herbarium, *A. obovata* is sometimes epiphytal, and it is probable that *A. Mannii* is also found under the same conditions. *W. Botting Hemsl., Herbarium, Kew.*

PEACHES AT THE ROYAL HORTICULTURAL SOCIETY'S GARDEN.

THOSE who have paid occasional visits to the Royal Horticultural Society's Garden at Chiswick during the summer and autumn of this year, cannot fail to have noticed how well the young Peach trees have been behaving themselves, the fine crops they have borne, and the deep colour of the fruit. These trees were presented to the Society in February, 1886, by Mr. John Fraser, of the Lea Bridge Nur-

* *Agapetes Mannii*, Hemsl.—Species nova. *A. obovata* similium, differt foliis laevioribus, floribus albis, corollis cylindricis semipollicaribus. Frutex nanus, forsam raro ultra pedem altus, ramosissimus, interdum epiphyticus caudice incrassato, ramulis gracilissimis brunneis hispidulis, internodiis quam folia multo brevioribus. Folia brevissime petiolata, crassa, coriacea, lanceolata spatulata, 6–9 lineas longa, obtusissima, glabra, venis paucis immersis inconspicuis. Flores albi viride tincti, 7–8 lineas longi, solitarii, penduli, pedicellis sursum leviter incrassatis flores vix aequantibus; calyx subcarnosus, parvisime puberulus, cupularis, dentibus 5 minutis acutis; corollae dentes brevissimi, obtusi, recurvi; stamina 10, prope corollae basin affixa, filamentis albis hirsutis quam anthera aurantiaca longioribus, antheris dorso bicalearis calcitrans sursum curvatis; stylus breviter exertus. Fructus nigrotus. *W. B. H.*

series, thus having been planted at Chiswick six years; they are trained on a long south wall, which is protected on either hand by walls, trees, &c. Several of the trees have been allowed to spread and now cover spaces 9 or 10 feet high, and as much across; most of the trees, however, have been kept small to allow of a larger number of varieties being grown. A few notes as to the time of ripening may not be out of place here. Waterloo, ripened about July 12, followed by Alexander at the middle of the month, the latter bearing a heavy crop of fair-sized fruits—highly coloured, and fine flavour; Early Beatrice was a week later than Alexander, and is a fine-flavoured, deep-coloured fruit. A few fruits of Early Rivers were gathered at the end of the month; this is a seedling from Early Silver, and is a large round fruit, beautifully speckled with red on the

August 27; Vanguard ripened a heavy crop on August 28, fruit large, streaked with red, flesh pale, juicy; early Murray and Bellegarde ripened on August 29; Frogmore Golden was gathered August 30, and is a beautifully-coloured fruit, like an Apricot, flesh yellow, good flavour and juicy. Malta and Downton Nectarine, both carrying fair crops, ripened on August 31. Later crops are Gregory's Late, just ripe; Late Admirable, Stump the World, Radcliffe, Teton de Venus, and Salway. Several other varieties might have been mentioned, but carried light crops; those mentioned above were excellent in every respect, and merited special attention. Given a good season next year, no doubt all the young trees will carry fair crops, and then comparison of dates may be better carried out. The Royal Horticultural Society is no doubt justly proud of its

proving of remarkable excellence, and varying from pure white to rose and crimson, those forms named C. M. Mrs. Brooman White and C. M. Empress of India being, perhaps, the handsomest coloured forms known, and they and other of the Arddarroch varieties have been already noted in our columns. Some of the specimens are over 3 feet across, and bear forty or fifty flowers, after the manner of that illustrated, which was taken from a photograph of a plant which recently flowered at Arddarroch.

HAZLEBOURNE, DORKING.

THE property of Welhore T. Ellis, Esq., situate near to Box Hill, of which a fine view is obtained from its grounds, has a pretty garden, in which a

FIG. 59.—CATTLEYA MENDELII.
(From a photograph belonging to R. BROOMAN WHITE, Esq.)

sunny side, and yellowish-green in the shade—very sweet and rich-flavoured. Acton Scott ripened about August 18, followed on the 20th by Scarlet Nectarine, the latter carrying a good crop of medium-sized but finely flavoured fruits; Early Alfred was ripe on August 22; Crawford's Early ripened on the 24th, and carried a fine crop; the white Nectarine also ripened on the 24th, followed by French Mignonette on August 25; Goshawk was fit to gather on August 26, and Early Louise on the same date—the latter is a medium-sized fruit, with a rough downy skin; Violette Hative also ripened on August 26, carrying a fine crop of fruit, medium size, good flavour, and a fine dark red colour next the sun; Hardwicke Elruge ripened on August 26; Dr. Hogg, Cricket Nectarine, Grosse Violette Hative, very deep colour; Red Magdalen, large, smooth skinned fruit, fine flavour; Stirling Castle and Red Roman, were all ripe by

fine collection of young Peach and Nectarine trees (consisting of about sixty varieties of the former, and twenty-four of the latter), which they have become possessed of through the liberality of Mr. J. Fraser, of Lea Bridge. *Ludovica.*

CATTLEYA MENDELII.

RECENT importations of this beautiful variety of the labiata group of Cattleya have placed it among the most showy of the favourite genus, and the great variation in colour to be found in it renders it safe to acquire a goodly number of plants, for seldom are two exactly alike. In the gardens of R. Brooman White, Esq., Arddarroch, Garelochhead, Dumbartonshire, such a favourite is it, that a direct importation of it was made, the plants of which on flowering

huge specimen *Sequoia gigantea* and a few other large Conifers at the entrance form conspicuous objects. The flower garden also is very gay, and the whole of the things cultivated are in the best condition. But it is to the glasshouses that we must turn for the most interesting features of the Hazlebourne gardens, for, by the evidence of the new extension of the gardens under glass, it is in that direction that the tastes of the proprietor and his family lie, and especially in the cultivation of Orchids, for whose accommodation the new houses are chiefly designed. The pretty conservatory with its pillars and roof partly clad with showy climbers has a beautiful and glowing arrangement of flowers, among the elegant Palms and foliage plants. Here the Begonias and the remarkably well-cultivated specimens of *Achimenes* contribute largely to the show; the last-named being very fine in quality,

and literally covered with their pretty and variously coloured flowers. Some years ago the *Achimenes* used to be very extensively grown, but of late they are not so frequently met with in really fine condition.

The next house is a very prettily-arranged one, in which Orchids, chiefly in bloom, are mingled with coloured-leaved *Caladiums*, &c. Among the best specimens were three fine plants of the new *Cattleya Rex*, which have recently flowered and have seed-capsules, the result of cross-fertilisation; for Mr. Ellis, and his energetic gardener, Mr. Masterson, are trying their hands on this modern evolution of Orchid culture.

The *Cattleyas* are all in fine condition, and the *Calanthes* are grown in a strong and healthy manner, and showing well for bloom. Some good *Cypripediums* also occupy this house, and with regard to the *C. niveum* class, viz., *C. Godefroya*, *C. concolor*, and *C. bellatulum*, Mr. Masterson states that formerly they did not thrive satisfactorily, and it occurred to him that the addition of pieces of broken limestone rock, such as are found invariably about the roots of the imported specimens, might help them. He tried it, with the result that they are in the vigorous and still improving condition they are now in. Among the best specimens in flower in this house are a handsome plant of *Dendrobium formosum giganteum*, with sixteen flowers; a very fine form of *Laelia pumila Dayana*, with five blooms; several very handsome forms of *Odontoglossum Barryanum*, *O. crispum*, *O. hastilabium*, *O. grande*, and other *Odontoglossums*; a very fine *Dendrobium Dearei*, *Oncidium papilio*, *O. Kramerii*, *O. crispum* and *O. dasytyle*; the pretty *Trichocentrum albo-purpureum*, with several flowers, &c. Suspended overhead are a fine specimen of *Culogyne Massangeana*, with five spikes; some well-bloomed *Stanhopeas* and other Orchids in hanging-baskets, the whole combining to make a most effective arrangement, the beauty of the flowers being still further enhanced by the healthy appearance of the plants, and their clean, bright green foliage.

The next range in two divisions has healthy *Dendrobiums*, *Cattleyas*, &c., in the first, and in the second division other intermediate-house Orchids, of which the most noteworthy are some vigorous specimens of *Dendrobium Falconeri*, compactly trained, and which flower profusely and give little trouble. The situation they occupy is on a shelf near the glass of the roof, and they are said to be lightly syringed over frequently.

The *Odontoglossum*-houses contain a large quantity of plants in the most perfect health, showing that their culture is well understood; but the good impression caused by the excellent culture is somewhat toned down by the unwonted predominance of *Odontoglossum Lindleyanum*. The plants were imported direct, and the very thing which the venture was meant to cause to be avoided is that which has taken place.

Two new ranges of Orchid-houses have just been finished by Messrs. Foster & Pearson, of Beeston, Notts, and the span-roofed range in two divisions erected by them for the purpose of growing medium-size Orchids is all that an exacting cultivator could desire. It has ample rain-water tanks, perfect ventilation, easily-regulated heating, and the pitch of the roof and arrangement of the staging provides for the plants being well up to the glass, whilst at the same time they are convenient to get at. The staging is of iron, covered with red tiles, on which coal-ashes are placed for moisture, and everything about these new structures is arranged for utility and durability. The heating of the whole block, too, is carried out by Messrs. Foster & Pearson, one of their boilers working the whole; and the same firm are building the new Rose-house and pits in the paddock, which it is intended to incorporate with the already existing garden.

The *Phalenopsis*-house is undergoing rearrangement, the specimens already cultivated thriving so well that it is intended to grow them and allied plants more extensively.

In one of the houses are several specimens of the curious trailing *Oncidium scansor*, which has bulbs somewhat like those of *Odontoglossum Rossii*, but distantly borne on thin rhizomes, the newly-formed growths looking much like flower-spikes. But probably from the want of something necessary to bring about its flowering condition the flowers never appear. Other interesting plants are to be found in the other houses, and abundant evidence that Mr. Ellis and his family take personal interest in the gardens.

THE DOUBLE-FLOWERED TUBEROUS BEGONIA.

Those who have had the opportunity of attending the metropolitan exhibitions during the past season must have noticed the remarkable exhibits of double-flowering *Begonias*, exhibited principally by Messrs. John Laing & Sons, and Messrs. Cannell & Sons; and those of us who have noticed the rise and progress of other beautiful garden flowers as well as the *Begonia*, cannot help noticing the changing fashions in flowers, as in other things pertaining to the necessities, but especially to the luxuries, of our daily life. I well remember the late Mr. Charles Turner telling me he had to throw away a houseful of fine plants of *Souvenir de la Malmaison Carnations* because no one cared to buy. Some years later the same firm could not supply the demand for them. I do not say that the *Carnation* was, or ever will be, a despised flower; it has always been grown, and ever will be grown, by those who care nothing about the popularity of a flower, but who value them for their sweetness and beauty alone. The fakes and bizarres also had their season of neglect. The choice old varieties raised and cultivated by the florists of bygone days were so little cared for, that many of them passed out of existence, and those that were obtainable were so debilitated by neglect, that new seedlings had to be raised before the florists were again in possession of a vigorous strain; and in this instance we owe a debt of gratitude to those who kept up the strain of the white-ground *Carnations* and *Picotees* through many years of comparative neglect. I mention *Carnations* and double *Begonias* together, because the flowers have some resemblance to each other in form.

At the *Carnation Society's* exhibition in July last, one of the most enthusiastic *Carnation* amateurs remarked to me that we ought not to rest satisfied until we had obtained *Carnations* of as large size and as well formed petals as those of the double-flowered *Begonias*. I thought it was a compliment to the *Begonias*, for I found that many of them, although they looked very handsome at the first cursory glance, lacked a good deal in that symmetrical form which the *Carnation* has. They were more double, but the petals instead of the regular and pretty arrangement of those of the *Carnations*, were crowded together, forming, in most instances, a number of centres instead of one. No florist worthy of the name would keep seedling *Carnations* with flowers like some of the double *Begonias*. It is pleasing to observe that in the case of some of the newer *Begonias*, varieties are to be found amongst them with the petals well arranged, of good form and with one centre only to each flower. I am informed that Messrs. Laing have some of this type. Indeed, I saw a most charming variety last year in the now celebrated nursery at Forest Hill, but for certain reasons, I would rather not say what name Mr. Laing proposed to give it; but I may say that the flower exactly resembled in its imbricated form a double *Camellia*. Mr. Cannell has also obtained examples of the right form. He had a single bloom of a scarlet-coloured variety at the Crystal Palace *Dahlia* show, faultless in form, which, with pardonable pride, he pointed out to his very particular friends; it was unnamed, and its owner seemed to think none of his living contemporaries were worthy of the honour of having their name attached to it. At all events, name or no name, the leading cultivators have now obtained varieties with exquisitely

formed flowers, the next process will be to lay all the shades of colour upon them.

As a raiser of *Carnations*, I am willing to admit that there is yet ample room for improvement both in form and colour. The raisers of double *Begonias* need to study form more; they already have the most lovely colours, and as decorative objects for the greenhouse or conservatory there are few summer-flowering plants to equal *Begonias*. They are easily cultivated, particular varieties being propagated readily from cuttings of the side growths taken off with a small portion of stem attached, and if these are planted in a sandy compost of equal parts of loam, leaf-mould, and sand, the cuttings form roots in a short time. They must be well looked after, of course. The best place for them is a forcing-house or pit, but besides this a mild bottom-heat should be provided. Cover them with hand-glasses, which should be kept rather close, removing the tops daily, and wiping off the moisture which gathers upon the glass. The cuttings must not have much water, or they would decay at the base. A small tuber will form at the end of the cuttings, which will flower strongly the following season. A thin shading ought to be placed over the glass to prevent injury from the sun, and when it is seen that the cuttings have formed roots, air must be admitted more and more freely, and less shading used. The production of plants by cuttings is necessary to obtain and perpetuate particular varieties, but it is a slow process in comparison with the more interesting one of raising plants from seeds. *Begonia* seeds are easily obtained from single flowers, which are produced on the varieties with double flowers; and if sown very early in the year, and grown on during the spring months in a hot-house, they can be grown into good flowering plants the same season, few plants needing less attention. They are as easily grown as *Fuchsias*, *Pelargoniums*, &c., and require very similar treatment in respect of potting material, watering, &c.

The better varieties now in cultivation can be obtained at a cheap rate, and those wishful of raising seedlings should purchase the best varieties to start with. As a type of double *Begonia* to avoid, I would instance one named *Goliath*—it has enormous red flowers, with half-a-dozen different centres; and as the right type, I recommend *Octavie*, white, and *Rosebud*, a charming rose-coloured variety. I noted a few of the very best varieties at the *Begonia* exhibition the other day, which may be useful to those thinking about forming a collection. The best in Messrs. Laing's group were *Lady Theodora* Guest, beautiful, delicately-tinted apricot colour; *Duke of Grafton*, clear salmon; *Lady Gertrude*, rosy-peach, white centre; *Duke of Fife*, deep cherry-rose; *Lady Dunsany*, salmon-peach; *Lord Esher*, bright fiery scarlet; *Picotee*, cream, the edge of the petals shaded rose; *Sir Trevor Lawrence*, bright red; and *Mrs. Regnart*, clear yellow. Messrs. Laing's exhibit comprised a fine collection of plants in flower, well grown, and the flowers standing up well above the foliage.

A good collection of cut flowers were sent by Messrs. Cannell, of Swanley, the best being *Rosebud*, clear rose; *Octavie*, a lovely pure white variety; *A. F. Barron*, clear rose; *Mrs. Lewis Castle*, apricot and salmon tints; *Mrs. Falconer*, fine deep yellow; *Mrs. C. West*, apricot-yellow, finely-formed petals; *Mrs. French*, cream colour; *Wm. Holmes*, salmon-rose; *R. B. Pearson*, a fine full rose. *J. Douglas*.

MARKET APPLES AND PEARS.

As the subject of Apple culture seems at the present time to be an important question for the country, perhaps this small contribution may be worth a place in your paper. About fourteen days past, Mr. Bick, gardener to W. Chamberlain, Esq., Harborne Hall (three miles from centre of Birmingham), brought me three or four of a bright coloured Apple in splendid condition for colour and dessert purposes, it was the old red *Astrachan*. This Apple is well suited for growing near towns, and colours

and ripens well, and bears an average crop, frequently fruiting on one and two-year-old plants. What I wish to observe is, the time it takes to get growers to take up an Apple for market. I have observed and taken a keen interest in the fruit that comes into Birmingham market during a period of at least a quarter of a century, and observe that to-day the same kinds of Apples and Pears find their way thither (foreign excepted). The Apples are Devonshire Quarrenden, Wyken Pippin, Blenheim Orange,

would buy it in preference to the American fruit; but they never have the chance here. A good average cropper which fruits when young, and good all round, is Lane's Prince Albert, the most prolific Apple I have ever seen or heard of, and a grand late Apple. I know trees that have never missed bearing for twenty consecutive years, sometimes very heavily, others light, as this year. It will keep sound till June; in fact, I have a few at this moment sound. This variety frequently bears on maidens. Wishing

of all foreign Apples, Newtown Pippin, frequently made less per barrel than the commoner but red-skinned varieties, as Baldwin and others. We also have plenty of Apples brilliant in colour and of fine quality, and a suitable climate, but there are many things yet to be done before we can dispense with the American, Canadian, and other fruits. An important item is the winter storage. Why could not our immense cider orchards be grafted with fine varieties? I enclose you a fruit of red Astrachan I picked from under some small trees in our nursery fourteen days ago five miles from Birmingham. *John Pope.*

MAXILLARIA VENUSTA.

The accompanying illustration (fig. 60) shows a very curious union of two flowers of this beautiful species. The specimen was sent to us by Mr. McArthur, of Maida Vale. Union of two or more flowers, or "synanthly," as botanists term it, is of course a very common occurrence; but the flower before us is peculiar in two ways—first, that the union has taken place between two flowers, one above the other in the same vertical plane, instead of laterally as is commonly the case; and next, that all the parts of both flowers are present in their usual state. Usually when the flowers are united by their sides, some of the parts are squeezed out of existence, and the number of parts therefore is diminished.

In the plan BB shows the position of the bracts; ss, represent sepals; P, petals; L, lips, within each of which is the column.

FIG. 60.—MAXILLARIA VENUSTA.

THE NEW CELERY-CULTURE.*
HOW TO GROW FINE CROPS
WITHOUT BANKING.

Starting the plants.—For early Celery, seed of White Plume or Golden Self-blanching is sown in February in flats 2½ inches deep, containing about 2 inches of loam. The surface of the latter is packed down, the seed is sown, pressed into the soil, and covered with about an eighth of an inch of loam. It is then watered, and the flats are piled on top of each other to keep the soil moist. In about six days they are taken down, watered, and piled up again, to remain until the seed begins to sprout, which one may expect in from ten days to two weeks. The flats are then spread out so that the sprouting seed can get the sun and air. At this time great care is necessary to keep the sprouting seed from drying up. Two hours under glass in the hot sun may destroy the plants, and yet sun and air are just what they need to make them stocky and vigorous.

When the plants are about 1 or 1½ inches high, prick them out into flats filled with good rich loam 2 or 3 inches deep, or set in the garden if the weather is suitable, from 2½ to 3 inches apart. Great care must be taken at all times to give the plants water enough to prevent them from wilting. When they are from 2 to 3 inches high, I scatter about two tablespoonfuls of Stockbridge Celery-fertiliser on every 75 or 100 plants. Scatter the fertiliser on the plants when the foliage is dry; then brush it off with a broom or the hand.

Preparing the ground.—Soil should be well enriched for Celery-growing. A crop of Celery cannot be injured by too much manure, provided it gets plenty of water also. Plough the manure under, or, in a garden, spade the ground, carefully turning all the manure under. Then scatter about 1500 lb. of Celery-fertiliser to every acre, harrow and rake the ground level. If the soil is a light loam, roll it with a heavy roller; a board will serve for firming a small patch. Raking the ground smooth saves much labour. If the ground is level and well pulverised, you can run the knives of the wheel-hoe

Ribston Pippin, Flanders Pippin, Souring, and after Christmas the Claygate Pearmain and Court Pendu Plat, and just now and then a few Lord Suffields, &c., sent in by gardeners and nurserymen. All excellent sorts, although many that do not bear till they are eight or ten years planted, such as Wyken, Ribston or Blenheim. I have never seen in our market one pot of red Astrachan, Cox's Orange, or Lane's Prince Albert Apples; and yet the first-named variety bears early and well, and is the most suitable and would be a saleable and profitable early Apple. Of Cox's Orange, there are numbers of people who know this Apple to be one of the best, and

to be brief, I only mention a few sorts. What I see and contend for is, that there is a good market and a large demand in the town for good English-grown Apples. So many physicians and doctors now recommend them to be eaten for different complaints, that buyers would prefer English-grown if they could get them. We want Cox's Orange to compete against Newtown Pippin, but our growers have stood still while the Americans and Canadians have gone ahead for the eye-colouring as well as the palate. An incident occurred last year which I do not remember to have done so before. Most purchasers are taken by the colour, and so it is that the best

* Condensed from pamphlet *The New Celery Culture*, published by the Rural Publishing Company, New York city. Price, 25 cents.

very near the plants, save much hand-weeding, and the hoe can be run much faster.

For all kinds of vegetables—Beets, Carrots, Onions, &c.—a thorough raking, which pulverises and levels the ground, not only saves labour but also increases the product. A wheel-hoe cannot be advantageously used if the ground is lumpy, stony, or uneven. In the farming of the near future the wheel-hoe is destined to become a very important implement.

Setting the plants.—Mark off the ground in rows 7 inches apart, and with a dibble or trowel set out the plants—from 3 to 6 inches high—7 inches apart, straight in the rows. If they are half an inch from a straight line, either to the right or left, they are in danger of being cut off by the knives of the wheel-hoe. Press the ground firmly about the roots. If the weather is warm and dry, water well after the plants have been set out, giving the ground a good soaking to keep them from wilting.

When the weeds begin to appear, run the wheel-hoe through the rows. The knives are too long for rows 7 inches apart; cut them off about 5 inches from the centre of the hoe. There will then be 2 inches between the ends of the knives and the next row. After you have gone through one way, let the crop stand a day or two before going through the other way. Four to six days afterwards go through again. Use the wheel-hoe frequently, and you will be agreeably surprised at the large amount of hand-weeding that is avoided.

When the plants are about half-grown, scatter broadcast about 1200 lb. of fertiliser to the acre. Do not do this when the foliage is wet. I have never discovered any injury from using fertiliser, even on tender plants, when the foliage was dry.

The plants are now so large that the hoe cannot be run through them. They cover the ground, preventing the weeds from growing, except a few that started before the Celery. Now, as you look over the field, you can readily realise that the crop is very large—126,000 plants on an acre. The soil is full of working roots that require a large amount of food, and it must be given in a liquid form, hence the necessity of giving the plants plenty of water. Vegetables drink the food, while animals eat it; hence the great importance of giving Celery an abundance of water to dissolve its food. The more fertiliser used the larger the growth, and the more water required to make the food in the fertiliser available. There are 100,000 good plants upon an acre, allowing 26,000 for small plants and "misses."

The illustration shown here [not given by us. Ed. of the *Gardeners' Chronicle*] is taken from a photograph of my field, displaying a crop from which I sold Celery at the rate of 10,000 dols. per acre. The plants from this crop were set 7 inches apart each way. The Celery was very nicely blanched, and much cleaner and brighter than any Celery banked with earth. It was pronounced the best Celery ever seen at that season of the year. One plant made a satisfactory bunch which readily sold for 1 dol. 25 cents per dozen, or over 10 cents a plant. Last season the yield on one twelfth of an acre was at the rate of 4000 dols. an acre. It was sold to commission merchants in Providence, R. I., for 1 dol. a dozen; a few dozens were sold in the market for 1 dol. 25 cents each.

Blanching Celery.—Three or four weeks after the 1200 lb. of Celery-manure before mentioned had been applied, about 1300 lb. more were used. The Celery at this time was growing and blanching rapidly. In the new Celery-culture there is no back-breaking labour in banking up. The working roots are not cut off to secure earth to bank it up, thereby checking the growth. No rheumatic pains are caused by getting down on one's knees to press the earth about the plants. No worms eat the glossy surface of the stalks, making them rusty and unsaleable. The growth is very rapid, consequently the crop is tender, solid, and brittle; there are but very few spongy plants. Watering or irrigating is the all-important work, and about all that is

necessary at this stage of growth. The natural rainfall cannot be depended on to give sufficient moisture to grow such a large crop.

Celery to be "good" must be pleasing to the eye as well as pleasing to the taste. The bunches ought to be uniform in size, the plants washed clean and well trimmed. By adopting the new method of growing Celery—that is, planting it 7 inches apart—the foliage is so thick that beneath it the air is moist and the shade dark, causing the Celery to blanch well, especially the easily-blanching varieties. All Celery not blanched before it is time to secure it from frost is packed in pits. These are dug from 18 inches to 2 feet deep (according to the size of the plants), and about 6 feet wide. The earth thrown out is banked on each side, forming a wall 1 foot deep, and making the pit from 2½ to 3 feet deep. The Celery is dug up with a little dirt adhering to the roots, carried to the pits and closely packed. Posts are placed where needed to stretch stringers upon, to support the covering of boards. Be sure the covering is strong enough to hold up from 3 to 8 inches of soil. Leave a board loose every 15 feet, so that it can be taken off to give air or to reach the Celery when wanted. Cover this board with coarse manure so that it may be removed, and the Celery taken out when the ground is frozen.

This pit answers very well for keeping Celery up to Thanksgiving or Christmas. One acre of Celery well grown by this new method will require about one-tenth of an acre of storage room. Very few farmers have this in their cellars or root-houses. Make the pits a foot higher on one side, so that the water may run off. Do not store your Celery in pits or cellars when wet. I have stored Celery in pits as green as it could be, and taken it out in February and March well blanched. The pits are dug in the field near the Celery, so that the latter can be easily stored when dug. My soil is a sandy loam, so there is no danger of water getting into the pits. This high, dry, sandy soil is considered poor soil for Celery, but my experience has taught me that nearly all ground can be made good by a judicious use of water and plant food. Let me advise all those who contemplate growing Celery on an extensive scale not to do it by this new method without experience, but to try a small piece first.

Cost of an acre.—The expenses of growing and marketing 1 acre of Celery by the new method are as follows:—

1 lb. seed	\$2 50
10 cords manure	50 00
Spreading	2 50
Ploughing	2 00
Raking and rolling	5 00
126,000 plants	126 00
Planting	41 50
Hoing and weeding	27 00
2 tons fertiliser	80 00
Sowing fertiliser	3 00
Cleaning and marketing	250 00
Storing a portion of the crop	50 00
Cost of water and labour in watering	50 00
Total	\$889 50

With experience some of these expenses can be reduced. Barrow-yard manure in this vicinity is worth from 3 dols. to 4 dols. per cord. The cost of growing 126,000 plants, in hotheds or greenhouses, for early Celery, would amount to more than 1 dol. per 1000; but part of the plants were grown in the field at a cost of 50 cents per 1000. The cleaning and marketing would cost about 120 dols. if the Celery is sold to commission-merchants and marketed from the field before it is stored. The water used was from the city supply, running through a ½-inch meter, conducted through pipes in and through the field, to which was attached a hose at frequent intervals. The water supply was very unsatisfactory and insufficient, especially in dry, warm weather when the Celery was large.

Marketing the crop.—The question, "How did you market such a large crop of Celery?" has been often asked, and it is a very important question, judging from the large number of inquiries received. In places where the crop had grown rankly and rapidly it was ready for market in August. Two

large tubs, made by sawing a hogshead into halves, were taken to the field to hold water for washing the Celery. A man went along the rows digging up the plants with a spading-fork in his right hand, pulling them out with his left, and shaking the dirt from the roots by striking them against the handle of the fork. The plants were then stripped of wilted stalks and carried to the washing-tubs.

No knife was used on the Golden Self-blanching variety. The roots were left on, and the plants were washed with a brush-blom in one tub and rinsed in the other, then placed on a table, where they were bunched and packed in water-tight boxes or crates, enough water being poured into the boxes to cover the roots. Celery marketed in this way will keep good one week in warm summer weather. Commission-merchants can then ship to hotels and stores throughout the country. This is the greatest improvement ever made in marketing early Celery.

These crates are highly praised by all who use them. They are made to hold two or two-and-a-half dozen roots each. If the market is dull and part of the load is unsold, it can be left at some place or brought home and offered for sale the next day with a clear conscience, for it will be as good as the Celery taken up twenty-four hours later.

The increase in the consumption of Celery during the last few years has been so great that growers have not kept up with the demand. Last month (February) Celery was selling in Boston for 4 dols. per dozen. Three or four years ago but small quantities were sold before Thanksgiving. Now large quantities are sold in August, September, and October. To keep Celery brittle, solid, and saleable, these water-tight crates are indispensable during the warm summer weather. On Thursdays I have sold sixty or ninety dozen Celery roots to commission-merchants, they selling them on Fridays and Saturdays to markets and stores. The markets kept some of Celery till Tuesday and Wednesday of the next week, and this in summer with the thermometer up to 60° and 80°. Early Celery cannot be marketed successfully without these crates. A few buyers will object at first to having the roots left on, but after they see the advantages of the system they will not buy Celery in any other form. They find they can deliver it to consumers fresh and solid with the roots on. When Celery is grown and marketed in this way, three men can take up and prepare about 100 dozen in a day. *Robert Niven.*

CONIFER NOTES.

PROFESSOR BAILEY BALFOUR obligingly sends us from the Pinetum of Keillour, Perthshire, a series of specimens of *Abies balsamea*, showing extraordinary variations in the shape, size, and colour of the cones, the degree to which the bracts protrude, and to a less degree in the foliage. The Pinetum at Keillour, some 6 miles from Methven Castle, was originally planted in 1831 by Thomas Bishop for Mr. Smythe. Bishop kept a record of his planting, and a history of the plantation up to 1847, together with a chart. About 200 trees of *Abies balsamea* were planted, of which some thirty now remain, the largest being 60 feet in height, with a circumference of 5½ feet at 3 feet from the ground.

In the same Pinetum there is a magnificent *Picea Menziesii* with a stem 14 feet in circumference, and some 90 feet in height. Prof. Balfour, to whom we are indebted for these particulars, hopes later on to make a more extended examination of this remarkable Pinetum, one of the first formed in Scotland.

Abies Veitchii.—Mr. Croucher sends us from Ochertyre, near Crieff, a cone of this species, the first cone of its kind produced in this country so far as is known. It differs from the form figured in these columns on February 28, 1880, in having projecting bracts; but Dr. Mayr tells us that in Japan there is much variation in this respect. The tree at Ochertyre, whence our cone was taken, is 25 feet 6 inches high. We shall have another occasion of alluding to this species.

Two or three different things are known as *A. Veitchii*, but the one now mentioned is the true one. *Abies grandis*.—Mr. Crump kindly sends us from Madresfield Court, near Malvern, a splendid branch with cones of *Abies grandis*. It is well represented in our figure at p. 561 of our volume xxiv. for 1885. The tree is no less than 80 feet in height, a magnificent specimen, probably the finest in Britain. It has sometimes been mistaken for *A. magnifica*, but the specimen sent by Mr. Crump leaves no doubt whatever that the tree is really *A. grandis*. It would be of interest to know when it was planted.

CARALLUMA CAMPANULATA,
N. E. Br. (BOUCEROSIA CAMPANULATA, Wight).

This quaint-looking plant, represented at fig. 61, was sent to Kew from Ceylon in 1890, and flowered in July of this year. It is one of a group inhabiting the hot and dry regions of India and Africa, growing in places where there is little water and plenty of sunshine; they are rarely seen in flower in this country, and then usually only in large botanic gardens. The plant here figured is a native of Ceylon and the Madras Presidency, and was originally described and figured by Wight under the name of *Boucerosia campanulata*; but, as I have shown in vol. xx. of Hooker's *Icones Plantarum*, *Boucerosia* cannot be maintained as a genus distinct from *Caralluma*. I therefore now refer this plant to the latter genus.

Caralluma campanulata is a dwarf succulent plant 6 to 9 inches high, of tufted growth, with numerous 4-angled glabrous stems, $\frac{1}{2}$ to $\frac{3}{8}$ inches thick, toothed on the angles, the teeth bearing minute rudimentary leaves about 1 line long. The numerous flowers are disposed in hemispherical umbels about 2½ to 3 inches in diameter, terminating the stems. The pedicels are from $\frac{3}{4}$ to 1 inch long, glabrous, green speckled with dull purple. The sepals are lanceolate-acuminate, minutely ciliate-denticulate, glabrous. The corolla is 1 to 1½ inch in expanse, nearly flat, five-lobed to about half-way down, the lobes ovate-acute; the face of the corolla is of an uniform rich velvety brownish-purple; but beyond the velvet-like surface there are no hairs, and the lobes are not fringed, the back is green freckled with dull purple. The outer corona consists of five lobes, bipartite nearly to their base, with the divisions diverging, and acute. The inner corona consists of five simple linear lobes, incumbent on the back of the anthers, and adnate behind to the sinuses of the outer corona; they usually have two slight longitudinal grooves, and are irregularly three-toothed or sub-entire at the apex. The entire corona is dark purple-brown.

This species is nearly allied to *C. umbellata*, but that is rather a stouter plant, and has the corolla marked with transverse yellow lines. Since I consider *Boucerosia* to be generically indistinguishable from *Caralluma*, as I have already pointed out in the twentieth volume of Hooker's *Icones Plantarum*, and having recently gone through the whole of the Kew material, this may be a convenient place to enumerate the species which I refer to the genus *Caralluma*. All those here enumerated which are marked with a star (*) I have seen and examined, and those marked with a dagger (†) I have seen alive.

- **C. longidens*, N. E. Br.—Stems erect, branching; branches 5 to 8 inches long, attenuated upwards, 4-angled, angles toothed, the teeth furnished with fleshy, terete, acuminate, deciduous leaves $\frac{1}{2}$ to $\frac{3}{4}$ inch long. Flowers solitary in the axils of the teeth along the upper part of the stem. Pedicels $\frac{1}{2}$ -inch long, glabrous. Sepals 1 to 1½ lines long, ovate-acuminate, glabrous. Corolla with a campanulate tube 3 to 3½ lines long, and five spreading, ovate-lanceolate, acute lobes 3 lines long, apparently of a dark purple-brown colour, quite glabrous. Outer corona of ten subulate teeth 2 lines long, the five lobes of which it is composed being divided almost to the base into two long slightly diverging teeth. The inner corona of five subulate lobes, like those of the outer corona, but with the tips closely inrolled. Wady Laëmeb, between Suakin and Berber, in Nubia; Schweinfurth, 441! This has been distributed as *Stapelia angu*, Rich.; but that plant

is described as having a five-parted corolla, whilst this has a very distinct and rather large tube, with spreading lobes; nor is *S. ango* described as having such leaves as this plant has, and it comes from a widely different locality.

Possibly *Stapelia fasciculata*, Thunb., *Fl. Cap.*, may be a *Caralluma*, but his specimen has flowers. *N. E. Brown.*

GARDEN ORNAMENTATION.

WE can but praise the desire which shows itself in many of our gardeners, amateur and professional, to ornament our public parks and squares, and also private gardens, with a profusion of flowers which never fail to delight the eye and charm the mind. Floral decoration is based wholly on fancy, and the taste and ability of the individual ought to do duty for the laws which in the case of sciences must be learned and obeyed. But at the same time, the imagination must curtail its flights, and content itself with harmonious effects, without going in search of the weird. The taste for curious and out-of-the-way ornamentation, is not very pronounced in this eastern hemisphere of ours. Beds with thousands of arabesques intercrossing shrubs in the form of men, animals, or miscellaneous instruments, are sights not often met with here. In the United States, however, all is different. In the parks a desire, amounting almost to a plague, is raging for floral decoration in the shape of portraits of celebrated men, forty times larger than their natural size, pairs of gloves and boots, huge watering-pots, and a veritable menagerie of dogs, cats, and birds.

Those who intend to cross the Atlantic next year, should not fail to visit Washington Park, Chicago, where specimens of this extraordinary ornamentation are to be met with. The superintendent of the park is a German, who has given many proofs of the resources of his inventive genius, and if his latest ideas are more conducive to laughter than admiration, we must take into consideration the amount of trouble taken to produce the result.

The entrance to the flower walk in which the novelties of the year are displayed, for the superintendent changes his modes of decoration every spring, is made through a door entirely composed of flowers. The pillars are formed of planks of wood covered with trailing plants down the edges, while the middle is composed of ingeniously threaded Ivy leaves. The framework of the folding doors is of wood, but nothing can be seen but a profusion of leaves and petals. The next surprise that greets the visitor is a solar sundial, designed on some sloping turf. This dial, semicircular in shape, measures 10 yards. The plants used for "Sol's clock" are the *Echeveria*, the *Alternanthera*, and the *Sedum dasyphyllum*.

Continuing his walk through a sort of avenue formed by little pillars of *Echeveria* surmounted by balls of *Sedum*, the visitor will notice a majestic map of the world, in which continents, seas, islands, and even the parallels and meridians are represented by plants. The earth is coloured white on this terrestrial globe, the *Echeveria glauca* being employed; while the sea is depicted by the sombre colour of the *Oxalis*.

That there is a demand for this somewhat fantastical ornamentation is evident, for the gardens are visited by thousands of people, and as the designs are varied yearly, no lack of variety is provided. In our own parks we are content with trim borders and gay flowers and smooth turf, but the jaded taste of the American desires more stimulating floral attractions. The varieties of past years are too numerous to be mentioned here in full. One year,

an Egyptian scene was represented, with floral sphinxes and obelisks.

Another year, elephants were all the rage. Several animals contained no less than 3000 plants of *Echeveria*. Another variety was a perpetual calendar, the day and date being of *Echeveria secunda glauca*, on a background of *Sedum acre*; the date was changed nightly, and the gardeners often had to remove and replace 3000 plants before the morning.

An amusing anecdote is related concerning this new craze:—A newly-married couple had taken a suburban villa, which possessed a fair-sized garden; this was the special care of the wife, who, one day, while her husband was away at his work, called in the assistance of a "floral artiste" to plan her garden. She gave him *carte blanche* to act as he saw fit; but by planting the beds in the form of wild cats, fabulous birds, huge pairs of boots, and Guy Fawkes, and clipping the trees so that they resembled huge watering-cans and whisky-bottles, he so changed the aspect of the place as to cause the husband a severe shock of his nervous system, from which he was a long time recovering.

New York, Boston, Brooklyn, all possess fine parks, and we can but hope that they may not be spoiled in the way Chicago, in our opinion, has spoiled hers. *H. C. Pufe*, 80, *Elsham Road, Kensington.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

CUCUMBERS.—If seeds were sown as advised, strong plants will now be available for planting. Should the means of supplying bottom-heat be inadequate to requirements, a hot-bed should be made of lasting materials for the soil to rest on; and unless provision was made to preserve last year's Oak or Beech leaves in a dry condition, the materials from a spent hot-bed can be used instead. One-third of this to two-thirds of rough stable-litter, well-mixed, and turned several times before it is finally made up, will serve in maintaining a steady warmth for a considerable length of time, if firmly put together. When this hot-bed has attained a warmth of 75° or 80°, holes 6 or 8 inches deep may be made in it, and a mixture of loam, leaf-mould, and horse-droppings, placed in them, to receive the plants in something like twenty-four hours after completing the work. Plant firmly, thoroughly water the soil with warm water, and afterwards maintain a humid atmosphere, with a minimum temperature of 75°, until the roots get a good hold of the materials, which will be in about a fortnight. The treatment after this period should be somewhat different, as the shorter days and long nights favour sappy, unfruitful growths; and to counteract this, a dryer and more buoyant air is indispensable. Open the ventilators on all favourable occasions, if only for ten minutes once a day, and keep a sharp lookout for red spider and thrip. Plants now in bearing, and intended to yield a supply of Cucumbers well into the winter months, should be thinly cropped and relieved of their fruits as soon as large enough for consumption. Top-dress the beds if the roots have found their way to the surface, and assist the plants with liquid manure. Take advantage of sunny days to syringe the plants with soapy-water for insect pests, for success largely depends on perfect immunity from such plagues.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

CHRYSANTHEMUMS.—Care must now be taken in having the growths of these plants tied in, and any which are intended to produce show blooms should have all the side-shoots taken off as soon as they are visible, so as to throw strength into the main stems. At this part of the season the flower-buds are swelling fast, and the plants will require a top-dressing of rich fibrous loam, from which the finer portions have been removed, adding to this some partially rotted horse-droppings, first rubbing them through a coarse sieve; and these ingredients, with the addition of a sprinkling of bone-meal, will be found a suitable top-dressing mixture. Plants with from five to eight stems should be disbudded, so as to encourage the growth of fine blooms, and assisted

occasionally with manure-water, or a trustworthy artificial fertiliser. Should traces of mildew be noticed, apply flowers-of-sulphur without delay.

ERICAS.—Large specimens of the above not potted in the spring, but which were left over until they had finished flowering, are the better for re-potting at this season than late in the summer, when the flowering comes to an end. With the cooler weather now prevailing, and a moister atmosphere, the specimens have a better chance of recovering from the necessary disturbance of re-potting than earlier in the season; moreover, there is still ample time for the roots to seize upon the new soil before winter. Where it is found that the plants are too much pot-bound to carry them well through next year's flowering, it is better to pot them at the present time than to run risk in the spring, especially if they are large. Make sure that every plant that is to be repotted is in a nice moist condition at the root—a very important point—as then the plants will not require watering for some time after potting. As a soil for Heaths, brown fibrous peat of the best quality that has been stacked two years is best, and to this may be added sufficient clean sharp white sand and finely-broken sandstone, if obtainable, as will make it easily pervious to water, &c. The soil should be moist, not wet, as in the latter case it would form a hard mass into which neither water, air, or the roots could penetrate. Have good drainage, i.e., large crocks at the bottom of the pot, and gradually lessen the size of the rest till quite fine stuff is at the top, and over this lay some rough peat of the size of Walnuts. The old mass of soil and roots should not be much disturbed, and the new soil should be made as firm by ramming as the ball is, otherwise the water will run through the new, leaving the old soil dry, which would in a short time be injurious to the plants. Examine the plants at frequent intervals, and if mildew attacks them, apply flowers-of-sulphur. If a house cannot be devoted entirely to these plants, they should be placed altogether at the cooler end of it, or in a cool pit where there exist means to keep out frost.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, *Syon House, Brentford.*

GENERAL WORK.—In fine weather, advantage should be taken to ply the Dutch hoe freely among the growing crops, there being no better means to accelerate growth than by so doing, at the same time destroying small weeds. The lifting of late Potatoes should now receive attention during dry weather. Planting sets should be selected, and those that have been spread out to become green removed to shelves in a cool, airy place, exposed to the light. The frames or other contrivances for protecting the winter salads should be got ready, reserving enough glass shelter for the late Lettuces, planting these without delay, for if these were sown the third week in August, as advised, they will be of a nice size for planting. Earlier sowings may be placed where shelter can be afforded them with mats or frame-lights, it being useless to lift Lettuce which have blanched hearts; smaller ones, and those that are growing, being the best. Endive generally is hardier than Lettuce whilst unblanched, and the Round Batavian more especially, so that no haste to cover it need take place, the protection being afforded the larger Lettuce; and this will, at a later period, come into use for the Endives. If these latter are left as long as possible, they get quite hardened, and are better able to resist frost. Rain often does as much harm as frost, especially to blanched salads, and should be warded off. As towards the end of September we frequently get sufficient frost to destroy tender things, all protecting materials and shelter should be put in readiness. Vegetable Marrows, French Beans, Tomatos, and full-grown Lettuces may often be protected by a slight covering of canvas or mats. After severe frosts have occurred, nothing can be done, but a slight covering will eke out the supply of choice vegetables during early autumn.

DWARF BEANS.—The plants will be carrying a good crop of small pods, and if they are covered at night, the supply will last for some time longer, care being, of course, taken to remove the covering in fine weather. Dwarf Peas may be similarly protected, and they will stand more frost than French Beans, a piece of canvas will be sufficient. Veitch's Protecting Broccoli and Autumn Giant Cauliflowers are now giving nice heads, which, if cut with plenty of stalk and foliage, or drawn up with the roots and

kept thus in a cool place, will continue in good condition for two or three weeks afterwards.

LATE SPINACH, &C.—This, if it was sown early in the month of August, should be finally thinned, and if the plants are weak, they may be watered with liquid-manure, or dressed in wet weather with a good fertiliser. No delay should occur in sowing a few rows for early spring use, seed being sown in closer rows than earlier sown spinach. It will afford a certain supply when the larger plants are destroyed by frost. The seed-bearing stems of Asparagus ought to be cut before the seeds ripen, and not left to produce a numerous progeny.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, *Mereworth Castle, Maidstone.*

With bright weather, Apples and Pears are swelling to a good size, and the colour is better than usual. The crop of the former is better than was in these parts at one time expected. To still further develop the fruits, smaller and deformed ones may be removed, and the trees watered with farmyard drainings when time will admit, and especially if the soil be a hungry one. Fruit for exhibition should be fully exposed to the sun. Overhanging leaves should be snipped off, and all the fresh soft late breaks removed or pinched back. Cordon Pears on walls, and especially those worked on the Quince, should be well supplied with water, and liberally treated with suitable stimulants. Tits will be troublesome, and if the best fruits are not netted, or pieces of muslin or white paper put around them, these birds will make holes in them and render their keeping impossible. Earwigs also are troublesome, and should be trapped in the usual way. Espalier trees are with us making another break, and should be gone over for the last time before pruning, but the trees intended to be lifted or root-pruned should be allowed to make plenty of wood for the present, and the late young breaks should not be stopped.

Intending root-pruners should now mark all trees that are to be lifted, and soil should be forthwith prepared for them. This may consist of good loam in a rough state, with a fair sprinkling of bones, old mortar, or plaster, and charred earth, all thoroughly mixed together. The grubbing out of all useless trees should be undertaken, if these are on walls, and the ground deeply trenched, remembering that no tree should be put where another has stood without a good portion of the staple soil being first replaced by the above kind of compost. Walls that stand in need of repairs, or of wires for training, or where the courses between the bricks need pointing, should be taken in hand at this season. Now is the best time of the year to visit fruit nurseries, for the purpose of choosing varieties of fruits for planting.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, *Highbury, Birmingham.*

DENDROBIUMS.—A long and complete rest is essential for these plants in a house free from influences which may induce growth which is sure to remain immature. Upon this treatment of Dendrobies their successful culture much depends, also the longevity of the plants. Dendrobium Wardianum, D. Ainsworthi, and some others may be had in bloom by Christmas time, but the flowers will be unsatisfactory in quantity and in size, and the plants that produce them weakened thereby. Nearly all the various species of Dendrobiums can be well managed by having them altogether in one house or division when they are growing; but in the resting period it is different, and they must then be separated, as some require more warmth than others. For instance, the species D. crassinode, D. Wardianum, D. Falconeri, D. Ainsworthi, and their varieties. D. Pierardi, D. Devonianum, D. Dominianum, D. Freemani, D. heterocarpum, D. nobile, D. barbatulum, D. lituiflorum, and D. pulchellum, with Thunias and Barkerias, delight in a very cold treatment, taking no harm if in severe weather the night temperature sometimes falls to 40° whilst at rest, with all possible light afforded them, and just enough water to maintain plumpness in the pseudobulbs; on the other hand, D. Bensoni, D. Lowii, D. macrophyllum, D. aggregatum majus, D. anosmum, D. Dearei, D. Parishii, D. primulinum, D. formosum giganteum, D. Brymerianum, D. Phalsenopsis, and some others from North Australia, would be seriously injured if subjected to this cold treatment, and they should be rested in a warm house where the warmth never goes below 55° in the coldest weather, 60° being a more

suitable night temperature. The species D. thyrseiflorum, D. densiflorum, D. chrysoxum, D. fimbriatum, D. dixanthum, D. Farmeri, and D. Schroderii I find do well in the Cattleya-house whilst they are resting, as do also Mormodes, Gongoras, Catasetums, Cycnochea, Eulophias, Coryanthes, Chysis, and Cyrtopodiums, affording them a position well up near the roof. Regarding Dendrobiums, I may here remark that it is natural for D. Wardianum to commence to push new growths from the base very soon after the pseudobulb is matured, and for D. crassinode to start swelling its flower-buds at each node very early. The fact of seeing this may induce some growers to apply more warmth, but that is not needed, and the resting of these plants should be continued, as the young growths and flower-buds will not gain much in length, but will only become thicker and plumper, which shows that the cold treatment is good for them.

DISAS.—Plants of *Disa grandiflora*, if they are not as yet repotted, should be delayed no longer. Sandy peat, such as is used for Cape Heaths, is the best soil for them, and in this they seldom fail to flourish. If they can be grown with the Ericas, so much the better, otherwise a cold pit or greenhouse, where the temperature does not generally go below 40°, is a good place to winter the plants, taking care to keep them near the glass, to water moderately, and to keep them free from thrips and aphids.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, *Lonyford Castle, Salisbury.*

THE FLOWER BEDS.—At no time did the beds look brighter than during the past fortnight; the colouring of the Alternanthera was at its best on the 17th inst., and Pelargoniums, Ageratums, Violas were full and rounded masses of beauty. Much of this is now a thing of the past; as the 5° of frost on the night of the 17th, cut down all tender plants to the ground, and destroyed the flowers of Pelargoniums and Ageratums. On the Monday we picked all the dead flowers off the otherwise uninjured plants, upon which there are still abundance of apparently sound flower-buds, which, in the absence of frost, may expand and make the beds bright again; Heliotrope and Perilla had to be removed, and the beds dressed with light manure, dug, and replanted with Pansies. The blue and yellow Violas which were planted amongst the variegated and tricolor Pelargoniums last May, are still full of flower, and when the removal of the Pelargoniums becomes necessary, the surface will be but little disturbed, and will be levelled, and made neat, between the Violas. Thus arranged, the plants continue to flower more or less freely during the next seven or eight months, the remaining beds being filled with plants of the dark Harbinger, and yellow Cloth of Gold Wallflowers; Pansies Cliveden Blue, Cliveden Purple, Blue King, Imperial Blue, Sanbeck White, and Tory; Myosotis dissitiflora, Arabis, Aubrietia deltoidea, Saxifraga umbrosa, Daffodils, Crocus, Snowdrops, Hyacinths, and Tulips. The bulbs are deeply planted, and remain in the ground from year to year; and, in addition to saving a considerable amount of labour in taking up and replanting the bulbs, as is practised in some places, they flower all the better by being so treated. Aubrietias and Arabis may be planted almost close together if the stock is large enough. Daisies may be set at from 4 to 6 inches apart, according to the size of the plants. Other plants needing more space, from 6 to 12 inches each way, according to habit, the present size of the individual plants, and the amount of growth that they usually make. Variegated and Golden Thyme may be turned to a good account in the beds, also dwarf Laurustinus, Golden Yews, Box, and such like; and if they can be planted on a groundwork of Sedum, Cerastium, or Golden Pyrethrum, they will show to advantage. Periwinkles intermixed with variegated Ivy may also be used with good effect. In the case of the carpet-beds, we simply clear away all the tender plants as soon as nipped by frost, and level the mould. If the weather is dry at the time of setting the plants in the beds, water should be afforded to settle the soil about them.

CLEARING AND PLANTING.—When frosts have rendered Pelargoniums, &c., entirely unsightly objects, those which it is desired to save for another year should be lifted with a fork, and the tops and roots trimmed a little before they are potted or boxed in sandy loam. The beds may then be manured, if that be necessary, and dug, and again planted for the spring display.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES

MONDAY,	SEPT. 26	Sale of Dutch Bulbs at Protheroe & Morris' Rooms.
		Sale of Azaleas, Camellias, and other plants from Belgium, Narcissus, and other bulbs at Protheroe & Morris' Rooms.
		Trade Sale of Palms and other plants at the Wiltshire Road Nursery, Brixton, by Protheroe & Morris.
TUESDAY,	SEPT. 27	Dutch Bulbs at Stevens' Rooms.
		Sale of Dutch Bulbs at Protheroe & Morris' Rooms.
		Great Clearance Sale of Palms, Orchids, Ferns, herbaceous plants, Winter Garden Greenhouses, &c., at Pine-apple Nursery, Maida Vale, by Protheroe & Morris (four days).

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—55°.7.

Horticultural Education. We constantly hear complaints of the low wages paid to gardeners, of the relatively low esteem in which they are held, of the too abundant supply, of which our advertisement columns testify, and the like.

Of course, there is some truth in all of these complaints. Considering the responsibilities of his position, and the long period of pupillage he must undergo, no doubt the upper-class gardener is (as a rule) underpaid as compared with other craftsmen, and other servants who get as high, or higher wages and a higher social position, often with considerably less right to it.

But if what we have just said be true, it is we fear equally true that there is a large percentage of gardeners who are not worth the name, and who, by their inefficiency tend to keep wages low, and who bring a bad name on the fraternity.

As in most other cases, the gardener is pretty much what he makes himself. If he is a man of high character and attainments, we do not hear much complaint about inadequate wages or low esteem; but, on the other hand, we do con-

stantly hear in such cases of the good feeling that exists between employer and employed. Assuming that those cases are the exceptions, and that the rank and file are unduly depressed by adverse circumstances, we must point out that the remedy for these evils lies rather with individual gardeners, and combinations of gardeners, than in horticultural societies, or in any legislation, even were such possible.

One very potent cause of the depression is to be found in the circumstance that men are content to remain garden-labourers, rather than become gardeners. Of course, there is not much chance of promotion under such circumstances; the prizes and "pieces of good luck," as they are called, do not fall to such men, but to those who are striving to better their position by improving themselves.

We may not at present be able to rival the magnificent scheme of horticultural education sketched out lately before the Scientific Committee by Professor EMORY SMITH, and which is in process of fulfilment by the Leland Stanford Junior University of California. Indeed, we have more faith in plans that grow and are evolved by stress of circumstance than in those which are perfect from the first—on paper.

From this point of view, we publish the sub-joined circular with great satisfaction, as it seems to offer help to those who are willing to help themselves, and to be a means of raising the position of the gardener and the forester:—

"Royal Botanic Garden, Edinburgh,
September 15, 1892.

Sir,—I have the honour to send annexed prospectus (with form of application) of a course of instruction for practical foresters and gardeners about to be instituted in this establishment, and to ask for your co-operation in making known the course to suitable men. I shall be glad to send additional application forms should you require them.

I would specially invite your attention to that feature of the scheme by which it is proposed to find employment in and about Edinburgh for young men from a distance desirous of taking advantage of the instruction offered, and in this way to enable them to support themselves during the period of study. The wage obtainable would be 17s. per week in this establishment, and about 2s. 6d. per day in nurseries.

The advantages of the opportunities of study afforded by the scheme are so evident, that they will probably be sufficient to induce good men to accept employment in Edinburgh at the rates mentioned, even although some diminution in their earnings is thereby involved. There is, however, the possibility that a deserving man might be called upon to make a pecuniary sacrifice in taking such employment which circumstances would not allow him to contemplate, and he might thus be precluded from attending the course.

To meet such cases, and to supplement the wage obtainable, it has been suggested that the County Councils and other bodies having control of the administration of funds which could be allocated to such a purpose might, in different localities, see their way to making small grants in the form of bursaries to aid men desirous of working through the curriculum, and that many individual proprietors would be glad to give some additional pecuniary help to young men from their neighbourhood who wished to reap the benefit of the education offered.

I therefore take the opportunity, whilst bringing under your notice the course of instruction proposed, to ask for your consideration of the suggestions I have mentioned, and to solicit your aid to give practical effect to them.

I have the honour to be, Sir, your obedient servant,
ISAAC BAYLEY BALFOUR."

"Course of Instruction for Practical Foresters and Gardeners at the Royal Botanic Garden, Edinburgh.—By arrangement between the Commissioners of Her Majesty's Works and the Board of Agriculture, a course of study in the sciences underlying the practice, and in the principles of forestry and horticulture will be instituted in the month of October of this year, at the Royal Botanic Garden, Edinburgh, for practical foresters and gardeners.

The curriculum will extend over two-and-a-half years, and will include the following subjects:—Chemistry, physics, meteorology, geology, surveying and mensuration, entomology, botany, forestry, and horticulture, and these will be taught practically as far as is possible.

The curriculum will be free of charge to those who are admitted to it.

The times of the classes will be arranged so as not to interfere with the usual hours of labour.

No one will be admitted who has not had at least three years of practical experience in forestry or gardening.

Applicants for admission must submit a recommendation and certificate of character from their employer.*

A certain number of men will be employed as members of the working-staff of the Royal Botanic Garden, Edinburgh, during the period of the curriculum. Such men will serve under all the regulations in force in the garden, and will receive the current wages of their grade. Through the co-operation of the nurserymen in Edinburgh, arrangements will be made for the employment of others in the nurseries about Edinburgh during the period of the curriculum.

Those who are admitted to the curriculum will be examined from time to time upon the subjects of study, and anyone who does not show satisfactory progress may be debarred from continuing the curriculum.

Practical foresters and gardeners desirous of entering on the curriculum are requested to fill [a form], and to return it not later than October 5, along with the recommendation and certificate of character mentioned above, addressed to the Keeper, Royal Botanic Garden, Edinburgh.

Should it appear to be necessary or advisable, some method of selection amongst the applicants may be adopted.

Applicants will be duly informed whether or no they have been admitted to the curriculum.

ISAAC BAYLEY BALFOUR, Keeper of the
Royal Botanic Garden, Edinburgh.

September 15, 1892.

* If an applicant happens to be out of a situation, a recommendation and certificate of character from his last employer should be submitted."

We do not see any provision made for instruction in drawing, nor in fruit culture under glass; but this latter, no doubt, could be arranged in concert with the head gardeners of some of the large private establishments in Scotland or England. Nor do we find any allusion to the granting of a certificate or a diploma to those of good character who have successfully passed the curriculum; but this, again, is a detail which can readily be arranged hereafter. That the classes will be held in the Botanic Garden affords a guarantee that not only the applications of vegetable physiology will be taught, but that some attention will also be given to secure a general knowledge of the conformation of flowers and of their names. We are disposed to think that the gardeners of the present generation are not nearly so well informed in this latter particular as their predecessors. It is rarely we meet a young gardener who knows the names of any but the commonest plants.

VIEW IN THE FERNERY OF THE "HORTICULTURE INTERNATIONALE."

For six years past the French government has been making experiments, under the direction of Dr. AIMÉ GIRARD, in order to test the value of the Bouillie Bordelaise as a preventive of the Potato disease (*Phytophthora infestans*), and in the early part of last year that distinguished chemist was able to report that the results year after year had been so satisfactory, that the mixture might with confidence be recommended as a preventive of the disease. Since then a number of experiments have been made, not only in other countries of continental Europe, but also in the United Kingdom, with varied results, and this year Messrs. JAMES CARTER & Co., of 237 and 238, High Holborn, London, W.C., decided to devote an acre of land on one of their seed farms at Bromley, in Kent, and further, that the experiment should be conducted on identically the same lines as those on the French government farm at Joinville-le-Pont. The direction was put into the hands of Mr. HENRY F. MOORE, the well-known agricultural writer, who consulted M. GIRARD, in order that the chemicals used might be of the same strength and quality as those used in France. We ourselves had the opportunity of seeing the application of the copper solution, as mentioned at p. 158 of the *Gard. Chron.* for August 6, and we also were enabled to see the results, a summary of which we now give.

The experiment was made on a field of a little less than an acre of Potatoes, which were planted in ten long double rows on April 8, the drills being 36 inches apart, a distance which Messrs. CARTER believe will be found more remunerative than if planted more thickly, as it permits the rays of the sun to penetrate the bed, an important factor in the development of this crop, and which, moreover, does not afford such facilities for the dispersion of the fungus spores as exist when the plants are crowded. The varieties planted were as follows:—

- Row No. 1.—Myatt's Ashleaf.
- " " 2.—Snowdrop.
- " " 3.—Beauty of Hebron.
- " " 4.—White Elephant.
- " " 5.—Carter's King of the Russets.
- " " 6.—Carter's Cosmopolitan.
- " " 7.—Carter's Improved Magnum Bonum.
- " " 8.—Bruce.
- " " 9.—Carter's Surprise.
- " " 10.—Imperator.

The whole piece was divided into four equal parts, of which the first and third were dressed with the Bouillie Bordelaise, and the second and fourth left undressed. The strength of the mixture was as follows:—

- 22 lb. of sulphate of copper.
- 22 lb. of unslaked lime, and
- 100 gallons of water;

this being the quantity necessary for an acre of Potatoes. The sulphate of copper is of 98 per cent. purity, and is the same as that used by M. AIMÉ GIRARD in his experiments. For the purposes of the experiment the first and third quarter were dressed with the Bouillie Bordelaise on July 11 and August 2, and the second and fourth were left undressed. The mixture was applied by the Antipest, the new knapsack distributor, invented by Mr. G. F. STRAWSON, which did the work admirably. On the second occasion, a German machine was also tried, this also doing good work.

Early in this month (September) it was clear that disease had appeared in the undressed portions, and on September 6 one root was dug from the centre of one row of each variety in the first three sections, with the result that in the dressed sections only two diseased tubers

were found in the twenty roots dug, and those were in the one root of Myatt's Ashleaf, a sort peculiarly liable to the disease. On the other hand, of the ten roots dug in the section not dressed, in four cases all the produce was found to be diseased, in two cases slightly diseased, in one case very slightly diseased, and in only three cases (new and vigorous sorts, it should be noticed) was the produce found to be all sound. In other words, 90 per cent. in one of the dressed sections, and 100 per cent. in the other dressed section, was found to be all sound and good produce, and in the case of the undressed section only 30 per cent. were sound.

On Thursday and Friday last the crops were dug, when the following were found to be the condition and weights of the different varieties of Potatoes on the four-quarter plots.

We cannot find space for the figures in each case, which were supplied us by Messrs. CARTER, but we may cite the following table, which gives the totals of the two duplicate experiments:—

	Dressed Plots.			Undressed Plots.			In favour of Dressed Plots.		
	cwt.	qr.	lb.	cwt.	qr.	lb.	cwt.	qr.	lb.
Weight of sound tubers	58	0	0	39	2	10	18	1	15
Weight of unsound tubers...	0	0	11	6	3	11	6	3	0
Total yield	58	0	11	46	2	4	11	2	7

It will thus be seen that, in whatever aspect the experiment is looked at, it is in favour of the dressing by the Bouillie Bordelaise. So far as sound tubers are concerned, the yield is over 2 tons per acre more than in the undressed portion (the two plots being less than half an acre), while the quality of the tubers is better.

Messrs. CARTER'S experiments are, as we expected they would be, conclusive as to the value of the copper solution when properly made and applied, and, in so far, they are in accord with the general body, though not with the whole of the evidence obtained in this and other countries.

The cost of the application, as carried out by Messrs. CARTER, was given in a preceding number, and it is relatively so low that growers may rest assured that from their point of view the game is worth the candle. Having watched and taken an active part in the two principal methods adopted of combating the disease, we can confidently assert that both the JENSEN method of high moulding and the copper treatment are efficacious, but the latter has the advantage of requiring a smaller expenditure of labour, and is therefore, the plan to be recommended by preference.

We may add that Messrs. CARTER have favoured us with an excellent photograph, which shows in unmistakable fashion the condition of a portion of the dressed and of the undressed plots respectively. We do not reproduce it, because it is almost identical with the illustration we have before given.

Lastly, as objections are sure to be raised by some interested or unduly timorous persons, we may add that no ill effect to the consumer of the sound tubers is likely to accrue from the use of the solution on the haulm some time before lifting.

FERNERY AT L'HORTICULTURE INTERNATIONALE.—Our Supplementary Illustration gives a view of the Fern rockery in the establishment of l'Horticulture Internationale, Parc Leopold, Brussels, in which the Messrs. LINDEN so cleverly combine beauty and utility. As will be seen by reference to our illustration, the permanently-planted rockery is still further beautified by arranging Orchids in flower

among the elegant frondage of the Ferns and the variously-tinted leaves of other plants. Similar groups may be found in other parts of the establishment, and everywhere order, cleanliness, and artistic arrangement is to be found in the extensive premises of this, the most important of continental nurseries, in which the culture of plants under glass is the chief object in view.

THE CERTIFICATES AT THE ROYAL HORTICULTURAL SOCIETY.—Now that the subject of these Certificates is under discussion, we may point out the glaring anomaly by which a plant like *Aristolochia gigas* receives the same description of certificate as a Dahlia or a Chrysanthemum. There are hundreds of the latter, and their cultivation is now well understood, but the *Aristolochia* is a thing apart—a truly magnificent thing—of recent introduction, while the skill in growing it in a small pot to a flowering state is a much greater cultural feat than any cultivation bestowed nowadays on Roses, Dahlias, or any other popular plant. If this sort of thing were done in some obscure cottage-garden show in the provinces, it would be excusable and attributed to ignorance; but at the Royal Horticultural Society, where all the talents are supposed to be exercised, and where exhibits are supposed to be judged on their merits, rather than their money value, it is nothing short of derogatory to give a "First-class Certificate" to such a plant. If it had been a First-class Botanical, or a First-class Cultural Certificate, there would have been less objection to be raised, but to place such a plant on a level with the every-day products of the florist is monstrous, and will not tend to encourage the introducer or raiser of new things. Surely if the original Dahlia or Chrysanthemum were now exhibited, it would be worthy, if not of a higher, at least, of a very different form of award from that now given to its descendants. We do not undervalue the commercial value of a certificate, but we do think that is the last, not the first, thing to be thought of at the Royal Horticultural Society, where absolute merit, and relative adaptability to particular purposes, should be the first thing to be considered. The committees have to maintain the reputation and the honour of Horticulture as represented by the Society. Commercial men may be trusted to settle the business value of a plant in their own way.

MISS JAMESON FUND.—In addition to the sums mentioned in the previous number, we have received the following:—

Sir Trevor Lawrence, Bart., President, Royal Horticultural Society ...	£3	3	0
W. T. ...	0	10	6

A GRAND INTERNATIONAL POTATO EXHIBITION, for the encouragement of the best means of Potato culture, and the introduction and diffusion of improved varieties, will be held by the executive of the International Horticultural Exhibition in connection with the show of hardy fruit, &c., at Earl's Court, London, S.W., on Wednesday, Thursday, and Friday, October, 5, 6, and 7.

HORTICULTURAL MEETING AT GHENT, ON SEPTEMBER 11.—Certificates of Merit, *par acclamation*, were awarded for a hybrid *Cypripedium*, C. Hyeann × C. hirsutissimum, notable for the large dorsal sepal—green bordered with white—raised by M. CH. VUYLSTEKE, of Loochristy. There was another hybrid, quite as fine, but less distinct than existing varieties, C. Harrisianum × Hookeri, flower very large, lip or dorsal sepal very fine, the general colour is claret; this variety should be very useful as a cut flower; it also is sent out by M. CH. VUYLSTEKE. Both the above varieties were shown for the first time. M. L. DESMET-DUVIVIER showed an *Anthurium Scherzerianum* with a double spathe; several flowers with the same peculiarity were borne on the same plant, as well as on another example taken from the former by division, and shown at the same time. It was noticeable that all the flowers grow from the centre of the plant, the leaves succeed them, which is

not the case with the ordinary Scherzerianum. A Certificate was awarded for *Miltonia Blunty* var. *Lubbersiana*, from M. J. HYE-LEYSEN; a rare plant with large flowers with a white lip, sepals and petals much streaked and spotted with mauve. The same exhibitor was awarded a Certificate for *Oncidium incurvum* album, the specimen shown bore a large truss composed of many small snow-white blooms; the ordinary variety has mauve flowers closely clustered, which are a pretty contrast to the white-flowered plant. Certificates were also awarded for *Epidendrum scepterum*—flowering rarely, from M. A. VAN IMSCHOOT, and *Cattleya Harrisoni* violacea from the same orchidist. There were some tuberous *Begonias* with sulphur-yellow flowers of unusual size, rounded and nearly 6 inches across, shown by MM. BLANQUAERT and VERMEIRE; tuberous *Begonias* with double flowers from Professor FRED. BURVENICH, the blossoms equally fine, erect in habit and garnet-red in colour. A plant for which we prophesy a successful future is a hybrid dwarf *Canna*, *Madame Crozy* × *Kaiser Wilhelm*, the specimens of which, shown in pots, were in good leafage with two trusses of open blooms, and several stems bearing buds, which stems are only about 15½ inches high. The flower is yellow, streaked with black. The exhibitor was M. T. SZEWCZIK. A hybrid of *Vriesia guttata* × *V. fenestralis*, named *V. Moensi*, was remarkable for the decided difference in texture of the inferior and superior leaves. Those in the centre were pale yellow, striped; the inferior ones were marked out in more or less regular squares, quite justifying the title "*fenestralis*" given to the parent *Vriesia*. This good hybrid was shown by M. ROBERT GRENIER. Mlle. EUGENIE GUEQUIER obtained an award for a collection of cut *Gladioli*, hybrids and seedlings of Lemoine. Mme. AUG. CORNELIS showed some flowers of *Magnolia præcox* Louis van Houtte, an excellent variety, flowering twice, in April and May, and in August and September. The blossoms are large, reddish-purple, and very fine. Certificates were awarded for *Epidendrum prismatocarpum*, with five stems, each bearing about thirty blooms, shown by M. ALF. VAN IMSCHOOT; for *Cypripedium callosum*, from M. J. HYE-LEYSEN, an excellent specimen, with two fine stems, bearing each twenty flowers; *C. Stonei*, from the same orchidist, a fine plant with six large flowers; *Gymnogramma Laucheana* from M. BEAN. SPÆE, a plant more than 3 feet across, of excellent habit; the fronds being slightly curved are very graceful. Honourable Mention was awarded for *Anthurium Andreanum grandiflorum* from the Société Anonyme Louis van Houtte père, with a flower of unusual size and colour, and for a fine lot of seedling *Gloxinias* from M. B. SPÆE.

VIOLAS IN THE PHENIX PARK, DUBLIN.—In writing of these plants, Mr. DICK states that they have been a great feature this summer, over 12,000 having been put out, and from first to last have made a great show. The plants were supplied by Messrs. DONNIE & Co., of Rothesay.

DYMOND AND PRINCE OF WALES PEACHES.—The first-named variety has been of great excellence this season in parts of the country where the Peach succeeds on the open wall. Our correspondent, Mr. MARKHAM, of Mereworth, speaks very highly of it, and from his young trees outside he has gathered some fine examples. It is a large showy fruit, with a rather deep suture extending from the apex and diminishing towards the base. The flesh is white, melting, and richly flavoured. Prince of Wales has been equally fine and good. It is usually a large fruit, and is thickly covered with down, green on the shaded side, and deep red in colour on the sunny side; it is of excellent flavour. It is now in season.

THE HARVEST IN BELGIUM.—From official sources is gathered a brief review of the state of the crops in Belgium. Cereals have done well; the yield of Rye has been unusual, and may be valued at at least 3000 to 3500 kilos. per hectare (1 kilo. =

2·2046 lb.; 1 hectare = 2·471143 acres). The corn is excellent in quality. Oats, though short in the straw, yielded better than was expected. The Potato crop was very great, and there was almost entire absence of disease, except among certain of the early varieties caught by the July frosts, which yielded less than in former years. With regard to Beetroot, the roots were small, and consequently light in weight, but were rich in sugar. The Beetroot yield was estimated at 30,000 kilos. per hectare as against 35,000 kilos. last year. Speaking generally, the harvest may this year be called excellent as regards food, but bad as to forage crops, owing to the drought; and also to caterpillars, which have been abundant everywhere.

FRUIT DRYING.—We are informed that the Fruit Drying Apparatus of Messrs. MAYARTH, at Chiswick, will be shown in operation on October 5 and following days.

INTERNATIONAL HORTICULTURAL EXHIBITION.—We are informed that, in recognition of Mr. MILNER'S great services to the International Horticultural Exhibition at Earl's Court, it has been decided to invite him to a complimentary dinner, to take place in the French Restaurant (Western Gardens), on Thursday, the 29th inst., at 6.30 P.M. (for 7 o'clock punctual), Mr. H. P. DODSON in the chair. Mr. RICHARD DEAN and Mr. L. DUCHÈNE are the secretaries. [Certainly such a compliment as this has been amply won by Mr. MILNER'S urbanity and tact in managing a difficult enterprise. Ed.]

NEW PUBLICATIONS.—*Contributions to Horticultural Literature*, being a selection of articles written for gardening periodicals, and papers read before various societies from 1843 to 1892, by WILLIAM PAUL, F.L.S. (W. Paul & Son, Waltham Cross), 8vo, 565 pp. We can now only acknowledge the receipt of this work, which is far too important to be dealt with in an impromptu notice. Later on we shall hope to call the attention of our readers to it more at length.—*Flora von Deutschland*, Dr. HALIER (Gardens, and Nördgate).—*The Gentlewoman's Book of Gardening*, by EDITH CHAMBERLAIN and FANNY DOUGLAS (Henry & Co.).

PLANT PORTRAITS.

NOTICES OF BOOKS.

FRUIT CULTURE.*

UNDER the above title, we have a manual on the culture of hardy fruits, by W. C. Strong, a gentleman who, as he says in the preface, has been engaged in the cultivation and sale of fruit and ornamental

* *Fruit Culture, and the Laying-out and Management of a Country Home*. New York: The Rural Publishing Co., 1892.

trees and shrubs for the past thirty years. The work is intended for the professed horticulturist and orchardist, and it is not the aim of this small volume to take the place of the larger works on the subject. The writer has borne this in mind throughout, and we therefore find the chapters on the various matters treated on in clear and concise language, and although it is a work intended for the North American cultivator, much of it is pertinent to fruit culture in these islands. America being still a new country, our author begins with the laying-out and formation of a rural home. In regard to choice of locality for an orchard, he prefers the hill to the valley, an elevated site being safer for all kinds of fruit that suffer from frost, and to protect trees at great heights from the dangers of exposure, of rapid evaporation of moisture from the foliage and loss of fruit from wind, he points out the great utility of wind-breaks of hardy trees, or failing these of high lattice to so sift the winds that the trees will flourish. We learn that the Bartlett (Williams' Bon Chrétien) and Anjou Pears are getting so largely planted, that there is danger of a glut, although at present their culture is quite profitable; and that the demand for winter Pears is "surprisingly limited." In regard to the Peach crop, one year of success will cover two or three of failure. Excellent directions are given as to choosing fruit trees, and great stress is laid, and rightly so, on getting them with clean, straight, smooth stems, and with plenty of roots about the size of a pipe-stem, the finer rootlets being of much less consequence; and, moreover, these generally perish from the hardships of transplantation. In regard to manuring orchards, the author quotes the opinion of Professor Maynard, of Massachusetts Agricultural College, who has used the following mixture for the past three years:—1000 lb. pure bone-meal, and 300 lb. of high-grade muriate of potash. This amount he considers sufficient for 1 acre of land.

Hard cutting-back is advised for all trees transplanted from a nursery, but not the barbarous chopping off of the head, as is sometimes seen. It is best to cut hard-back to obtain a vigorous start and a symmetrical head. We think that this is advisable only when there has been a great loss of roots, and the pruning is better done the next autumn or winter after planting. Irrigation—not needed here—comes in for notice.

Referring to the quality of the fruits grown in the United States, the author remarks on the want of flavour, although there is nothing to be desired in point of size and appearance of the Apples and Pears from California and the lower Western States as compared with those grown in Maine, Canada, and, we may add, Nova Scotia, which command three times the price.

The great plague of the American cultivator of fruits is the swarms of insects which attack every part of the tree, as well as the fruit, and naturally much information is afforded as to the best means for their extermination. The final chapters are taken up by descriptions and figures illustrating the different forms of budding and grafting, which do not differ from those practiced here.

THE GENTLEWOMAN'S BOOK OF GARDENING. By Ethel Chamberlain and Fanny Douglas. (Henry & Co.)

It is a little puzzling to know from what standpoint to criticise this book, for it does not claim to be a purely scientific and technical work, nor is it one to be read for amusement only. It consists, in fact, of articles of varying merit dealing with the romantic, poetical, decorative, and professional interests of the gentlewoman's garden. A good deal is said in praise of the old art of distilling, and still more about the delights of horticulture as a vocation for ladies—of robust health. The writer of the eighteenth chapter treats of gardening as a profession, and of the many gentlewomen who have adopted it, after a due course of education. We read that: "To meet the demand for training that is now arising, a Ladies' Branch of

the Horticultural College at Swanley, Kent, was opened in June, 1891. For the sum of £70 to £80 per annum the female students are boarded in a bright and comfortable home, close to the college, in the grounds and lecture-rooms of which they pursue their studies. The course includes botany, chemistry, zoology, physics, building construction, and book-keeping. To some minds much of this appears unnecessary; but it should be remembered that in this artificial age the gardener is always trying to forestall Nature, and only Science can help him (or her) to achieve this."

This last sentence contains "in a nutshell," the leading principles of modern horticulture. To be successful, a gardener now-a-days must not be content to do just as his fathers and grandfathers did before him; competition is keener than of old, and requirements are greater. To meet these needs, mere mother-wit and practice are not sufficient; they must be stimulated and increased by instruction and education. Hence, we read in the third chapter that, "Sometimes it is urged against gardening that it is a pursuit for stupid people only, affording little occupation to the mind, and still less occasion for

HOME CORRESPONDENCE.

CERTIFICATES AT CHISWICK.—I must in justice ask for a small space to reply to your correspondent at p. 341, as I consider he did not fairly handle the subject. I presume much of the grievance arose because the Pea had been granted three marks at Chiswick, an award which is supposed to be equivalent to a certificate. When I staged the dish of Success Pea on the 6th inst., I enquired if the Pea had been grown at Chiswick. Of course, being a member of the Fruit Committee, I ought to have known, had I been to Chiswick, but I have not been able to go of late. I also asked if it had received any award or First-class Certificates, and was told that three marks had been allotted to it. I said then, "It has not received a First-class Certificate, but it is, in my opinion, deserving one;" so I staged it; and as three marks had been awarded at Chiswick, the committee could do no less than give a First-class, providing the sample was worthy of it. I did not show it as of my own raising, but as Veitch's Success Pea. Last year the same Pea was shown, not by me, when I proposed an award, and was then told that Peas must be tried at Chiswick before an award could be given. I admit I did not send it to Chiswick, but it is the

many varieties new to this country five were brought up from Chiswick, and received First-class Certificates at one meeting. I presume the Royal Horticultural Society did not raise these Figs, but got them from other parts, such as Spain, France, or other foreign countries. Therefore, when the certificates were granted, they went to the wrong people. They should have been sent to the raisers, and I expect they would, in that case, have troubled less about them if no honour was to be paid to good culture, as very likely in their native habitat they were inferior to those staged by Mr. Barron. I admit they had been tried at Chiswick, but if your correspondent maintains that the award should be given to the raiser, the Royal Horticultural Society has no more right to these certificates than I have for the Pea, as we are both in the same category. Another question crops up, if nurserymen or seedsmen are to wait for everything to be tried at Chiswick before it is sent out, they will lose by so doing. I consider the trade act very fairly in this matter, as they do not object to the grower receiving the highest award, providing he does it honourably, does not palm it off as his own raising, and the trade do not lose by so doing, as a good thing, fruit, flowers, or vegetables, will hold its own when good. Many old things crop up that have never been certificated, but

FIG. 62.—POTATOS TREATED AND NOT TREATED WITH THE SULPHATE OF COPPER. (SEE P. 373.)

exercising the intellect. It is perfectly true that many gardeners of the old-fashioned type, without any claim to book-learning, were successful in growing well-flavoured vegetables and a profusion of hardy fruits and flowers. They were, it is certain, possessed of a natural shrewdness which enabled them to draw inferences from the experience of years. In most cases, also, these men had at their command unlimited supplies of stable or farmyard manure, and so they were able to produce good results; just as an old-fashioned country-house cook, innocent of French dishes, could prepare most appetising bills of fare with the fresh eggs, cream, fat poultry, and home-cured hams, all ready to her hand."

In addition to these general remarks, practical instructions are given which are mostly sound, though somewhat amateurish; the names of plants are begun with small or capital letters indiscriminately used; and the mis-spellings are innumerable. The romantic and poetical chapters abound in quotations, which must have involved no small work to select and string together. The general style (or rather styles), and tone, are chatty and pleasant, but a trifle diffuse. Careful revision by an expert will render the next edition more acceptable than the present. The book is one of a series (*The Victoria Library for Gentlewomen*), commendable for neat dainty binding, and excellent print and paper.

first time I have heard an award questioned in this way; the certificate was granted to the Pea, not to me as the grower, but to the variety. Why your correspondent should object to the Pea getting the award because it was shown by me, I am not able to judge. Others could have done so, and have done so, in similar cases; for instance, this year one of the committee staged a very good Fig, sent out by Messrs. Veitch, but the person exhibiting it got the First-class Certificate. Last May twelvemonth the well-known Model Broccoli received a similar award, and the *Gardeners' Chronicle* was not appealed to; being a member-exhibitor, I was debarred from hearing the objection raised to this certificate, but I believe it was carried by something like three to one. At any rate I fail to see, when a certificate, or award of any kind, is carried by a majority, why one of its members should rush into print, and depreciate such award. The award of First-class Certificates to gardeners, so far as the fruit committee is concerned, are few and far between. I have sent fruits and vegetables for some time, and though I do not complain, as the committee should only recognise improvements or superior culture, I do not think gardeners will be inclined to look with favour on the committees of the Royal Horticultural Society if such treatment is meted out to them, and they find that awards go to the trade chiefly. I will give another instance: The society has got a fine collection of Figs together at Chiswick, and Mr. Barron has grown some of the most difficult kinds to the best or highest state of cultivation, but I would point out, that of the

that have been in the front for excellence, and likely to remain so. I do not think the question of expense, loss of time, or inconvenience are taken into account by the larger portion of the committees attending Chiswick; they are willing enough to give their services, but I do think that persons interested in any particular exhibit or things growing there, should not be on a sub-committee. Exhibitors have to retire from the table at a full committee meeting at Westminster, and if the Chiswick sub-committee is to be empowered to give all awards for things growing at Chiswick, why should anyone interested be allowed to vote? The inference that exhibitors bring a selected sample does not strengthen the argument, as this is always done when fruit or flowers of any kind are exhibited. The committees of the Royal Horticultural Society do not visit gardens to see inferior things. What they pass judgment on are the exhibits before them—they do not give a man a Medal for the things he has left at home. *G. Wythes.*

THE NATIONAL ROSE SOCIETY.—My attention has been called to an article in the *Gardeners' Chronicle* of September 10, signed "Wild Rose," on the subject of the entries at the National Rose Society show of 1892. The writer has evidently had access to the books of the Crystal Palace, and is also in touch with the Treasurer of our Society, as I believe the latter is the only person who has reliable knowledge of the numbers of members who have joined the Society this year. I may at once say, I think these numbers seem to me most

satisfactory, and I would say also, quite justify any remarks I made last December as to the probability of our obtaining a large accession of members by a liberal policy—no doubt, we ought to have done better, if everyone had helped, and we may do better when it is more fully known how fairly our competitions are arranged, but time must be given for this purpose. However, I do not feel that I have not done my personal duty to the Society in respect to new members, and I believe this statement can be verified that those who worked hardest for the rights of the smaller competitors, have also put their shoulders to the wheel of the Society's financial coach, and with satisfactory results. It is a somewhat ungracious task to have to demolish "Wild Rose's" figures, even if they be apparently obtained from official sources, but the published table is full of inaccuracies, and even the additions of the figures given are wrong. Anyone can verify this at once by looking at p. 300 of the *Gardeners' Chronicle*, and by adding up the columns. The figures of the exhibits in 1892 as quoted by "Wild Rose," but which are really inaccurate, should be 144 and not 134, and in 1891, the number of entries given by him should be 205 and not 295, but these are really trifling errors as compared with the real position and facts which have been given to me from an absolutely reliable source, and which I have taken the trouble to check and verify by the reports and figures given in the *Journal of Horticulture* of the National Rose Society's shows, 1891 and 1892, another error discovered thereby being that the exhibits of 1891 in the classes specified were 141, and not 180 as quoted by "Wild Rose." The question, of course, is a larger one than the mere fact of the figures given being inaccurate; but when I further mention that in the column of exhibits in each class given for 1891, only three are correct out of sixteen quoted, the untrustworthiness of the whole table is made manifest. The real unfairness of the table given is in the fact that by the method "Wild Rose" adopts for the schedule 1891, an exhibitor of that year may be counted not only twice, but several times over, as the same person could have entered, and in many cases did enter, in several of the classes, and thereby could be counted as a new exhibitor on each occasion; the "extra classes" also so freely referred to in the table of 1891, having been practically eliminated by the system now adopted by the Society, their large numbers of exhibitors which "Wild Rose" quotes, should not be taken into account. I may mention here, *en passant*, that in these classes, extra class 19 is given as exhibiting fourteen boxes, whereas they really exhibited nine; and extra class 22 is quoted as exhibiting twenty-six boxes, they in reality having staged seventeen; and a wonderful number that was, too! I give these as specimens of inaccuracy, having already mentioned that out of sixteen statements thirteen are wrong. But eliminate the extra classes in 1891 as quoted by "Wild Rose," and correctly add up his column of the exhibitors, who were really exhibitors, of 1892, and what do we find? Quoted exhibits, 1892, correctly added up, 144; exhibits, 1891, as quoted by "Wild Rose," with extra classes eliminated 180 less 54 = 126; balance in favour 1892, 18 exhibits. But the correct number of exhibits in 1891 was 141, and not 180, so that if read in that light the figures come out as 144 against 141 less 54, or 57 in favour of 1892. "Wild Rose" judiciously says nothing of the fact that the new schedule was probably the cause of many exhibitors showing under their proper or higher divisions, nor that the number of Roses staged in 1892, some 7000 in all, exceeded by over 1000 the numbers staged in 1891. Nor does he mention that certain classes in 1891 were for special prizes not included or given in the schedule of 1892, and which therefore, cannot by any fair critic be accounted as properly going in the balance of one year's exhibits against those of another—in this connection I specially mention extra class 19 of which I happen to have personal knowledge. *Charles J. Grahame, Croydon.*

NEMESIA STRUMOSA (see Sept. 3, p. 277).—Mr. Mortimer, of the Swiss Nursery, Farnham, has probably been the first person in the country to grow this lovely annual in quantity, indeed, almost in any quantity, and he has conclusively proved that out on his open common land situate at a somewhat high elevation on the Surrey hills, that it is not only beautiful, but easily cultivated; more than that, Mr. Mortimer has shown that it can be freely seeded. I saw a large bulk of the seeds, whitish, fluffy, and light, the other day, and it is one of those seeds of which I know

nothing to match. The plants grow outdoors just as freely as do any hardy annual. They somewhat resemble in habit the well-known *Erysimum Perofskianum*, but have flowers that are probably as large and not unlike in form those of *Celsia cretica*. As to colours, it is probable that from a big batch such as I saw at Farnham, fully twenty might be found. Some of them are superb. They range from white to the richest of maroon-crimsons, gold and orange, reds, roses, carmines, scarlets, violets, all in wondrous beauty. The *Nemesia* has a long season too, for it was still blooming well on the 15th inst., and yet the plants were blooming from the end of June. Seed is sown in March in warmth, and the seedlings are then treated as *Phlox Drummondii* may be. Should it be possible to fix some of the richest colours, this annual will make a grand bedding plant; as it is for patches in the flower garden, it is simply beautiful beyond description. There can be no doubt but that the *Nemesia* will become one of the most popular in cultivation, whilst its future cannot be foreseen in relation to ultimate development, as it has all the capacity for great improvement. *A. D.*

DENDROBIUM PHALÆNOPSIS SCHRODERIANUM.—What an invaluable *Dendrobie* is this! Looking at Mr. Farnham's grand group at the Royal Horticultural Society's meeting on the 6th inst., and hearing the praise accorded them by Orchidists, makes me think this is the best *Dendrobium* ever introduced. Its lasting properties when cut are great, and the numerous different shades of colour exhibited by the plants make it a very attractive species. I find that it requires a high temperature to grow it well. *John Cavill.*

POISONING OF STOCK BY YEW.—There have been a good many letters in the papers lately on the subject of cattle being poisoned by eating Yew. I may as well say again (as I have before done in your pages), what I know on the subject. In the first place then, there is no difference whatever between the male and female tree in this respect. All kinds of stock eat both habitually with perfect impunity. There are numbers of pastures in many parts of England in which there are many Yew trees in the fields and in the hedges, and these are constantly eaten by all kinds of stock, and no one ever heard of their being the worse for it. The whole secret of their immunity from injury lies in their eating it "habitually;" and, therefore, I often plant Yew trees in the hedges of pasture-fields, in order to secure the stock from any danger of this kind; for there are occasionally cases where animals that have not usually had access to Yew trees, and have broken into a plantation, and eaten (probably too freely) of Yew branches, have died of it. There is no doubt also that half-dead clippings of Yew are poisonous. I am always very careful that these should never be left within reach of any kind of stock. I come back therefore to what I have said before. The best security against animals being poisoned by Yew, is to plant Yew trees in pasture-fields and in the hedges; and that if this were done universally, and care was taken never to leave clippings of Yew about, we should never hear of animals being poisoned by Yew. *C. W. Strickland.*

STEAM versus HOT-WATER.—In the editorial article in the *Gardeners' Chronicle* of this date, you give a very fair summary of Mr. Caird's theories as to the value of heating by steam for horticultural purposes as compared with hot-water, and if his bachelor's degree in horticulture depends on any merit he has established in favour of steam, the judges being practical as well as scientific men, I fear he will be plucked. On my taking the management of the gardens at Wrotham Park, near Barnet, in 1837, I found the then, and still, fine conservatory in the flower garden heated by steam. The boiler was a large one, and during severe weather a man had to sit up all night to manage it. We had to use Welsh anthracite coal. The temperature was not easily modified, and during the very severe weather of January, 1838, when the thermometer fell to 6° below zero, the frost got into the house and killed many plants—that was the year known as "Murphy's year." I persuaded my employer to do away with the steam boiler, and replace it by a hot-water one, adding about a fourth more to the pipe surface. This led to a saving of three-fourths of the coal, and it required only the ordinary attention given to such boilers. I was in this conservatory some three weeks ago, and found all the plants it contained in excellent condition. It is true that Mr. Caird claims for steam that it meets certain difficulties where the levels are awkward, some high, some low, and I admit the force

of his argument here; but any gardener worthy the name can so arrange as to overcome these difficulties without steam. If Mr. Caird takes into account the wages of the "skilled engineer" and his "mate," which cannot be less than 10s. per night, not to speak of pipes costing more than double the price of ordinary hot-water pipes, having flanged joints and india-rubber rings, as well as safety-fittings to the boiler, and greater original cost of steam-boiler over the ordinary hot-water boiler, I fancy he will see his degree all but at the vanishing-point. I have been led to send you the above remarks on heating hot-houses by steam from an experience of it which few gardeners of the present day have had. It was adopted to take the place of the old flues, and has been generally abandoned. *Wm. Thomson, Clovenfords.*

THE WEATHER AND FRUIT.—Although Apples and Pears are thin in some places, it is matter for congratulation that the weather has at last set in fine and warm. The good effect of the recent fine weather is already apparent, Apples and Pears having increased visibly in size and high colour. It is fortunate, therefore, the great fruit show that was arranged to be held this autumn has been put off for the space of another year, as fairly representative collections could not have been got together, and the more favoured parts of the country would have stood at a great advantage as compared with others less favoured by the season. As the crops are light this year, they ought, and will, barring bad weather in spring, be good next year, as the foliage is clean and healthy, and there is plenty of moisture in the ground. *J. Sheppard.*

THE ROYAL MUSCADINE GRAPE VINES AT TRAFALGAR PARK.—Good examples of this, the best of all Grape Vines for out-of-door culture, are sometimes met with trained on house-walls in the southern and western counties of England; but it is seldom that a south wall, 15 feet high and 70 or 80 feet long, is devoted to its culture. Such, however, is the case at Trafalgar Park, Salisbury, where two plants of the Royal Muscadine are planted about 35 or 40 feet apart, and have clean stems about 4 feet high and 9 inches in circumference. A branch is trained right and left at that point, and rods at 18 or 20 inches apart are trained from these upwards, covering the space mentioned. This was done many years ago, but the Vines are in good condition, and a good crop of fruit was maturing at at the time I saw them (September 16). *H. H.*

THE SEED TRADE.

THE FOREIGN GRASS AND CLOVER CROPS.—We are now able to estimate with some degree of completeness the results of the grass and Clover crops in the Darmstadt district of Germany, whence large supplies are annually drawn. It must be admitted, the prospects are by no means satisfactory; the dry, cold weather which prevailed during a considerable part of last winter had an injurious effect on the plants, and they were also retarded by the frequent frosts that occurred in April and May, followed soon after by unusually hot and dry weather. But most grass seeds, though light in weight, and deficient in plumpness, show a fine bright colour, and may be considered as of average quality; but the yield is far below what is usual in favourable seasons.

Achillea Millefolium (Milfoil or Yarrow), which is more properly classed with forage-plants, and is reckoned a grateful food for sheep, has been harvested in very small quantities, which will be quite insufficient to cover the demand. Aira (Hair-grasses), are useful for dry open situations, of which they sometimes constitute the principal vegetation. *A. flexuosa*, which is that most grown, is a very small crop, and as there are no old stocks to fall back upon, prices must rule high. *Anthoxanthum odoratum*, Sweet Vernal Grass, though it yields but a scanty portion of herbage, is useful for nursery on account of its pleasant aroma, is like the preceding very scarce; and so is the yellow Oat-grass, *Avena flavescens*, a species which yields a considerable bulk of fine herbage. The crop of Meadow Foxtail (*Alopecurus pratensis*), is smaller than that of last year, while the quality is not so good, and prices will be high in this case also, especially for exceptionally good lots. The tall Oat-grass

(*Avena elatior*) has been harvested in good quantities and the quality is very fine. Crested Dogtail (*Cynosurus cristatus*) has a very small yield indeed, and dear prices are certain. This species is very valuable on high and dry pastures or sheepdowns, not only on account of its fine short foliage, but also because it roots deeply, and so remains green through the driest part of the summer.

The small Fescues, *ovina* (sheep's), and *duriuscula* (hard) have also yielded a very small quantity of seed; and old stocks being limited in the face of a very large demand, there is certain to be a considerable advance in prices. The tall Fescue (*elatior*) will be dearer than for many years, the supply being so short. The meadow Fescue (*pratensis*) is a better crop, the seeds fine in colour, and perfect in growth, though a little light in weight. Already prices have risen considerably. The Bent-grasses (*Agrostis*) are scarcer this season than for many years, and prices for both the common and the Bent, or Fiorin, have considerably advanced. Cocksfoot (*Dactylis glomerata*), which, though apparently a rough coarse grass, is yet valuable, being much liked by cattle, unless when allowed to become rank, has yielded a large crop of seed, but light in bulk, and indifferent in colour; fine samples are scarce, and correspondingly dear.

Of the meadow-grasses (*Poa*), only the smooth-stalked (*pratensis*) has been harvested in satisfactory quantities; the quality is better than last year, and customary prices rule; the rough-stalked (*trivialis*) has yielded an average crop, the quality of which is inferior to last year's seed, and the drought and heat operated to prevent the seeds becoming as full and plump as usual; extra fine samples are scarce. The Wood Meadow-grass (*nemoralis*) is very scarce also this season, and the yield has been steadily declining for a few years past, while the quality of the seed is less than formerly. The crop of Canary-grass (*Phalaris arundinacea*), which is regarded as one of Nature's pioneers, is, of course, material, and can be used only cut into chaff, and mixed with other food. Very little seed of it has been saved, and it is both scarce and dear. Timothy (*Phleum pratensis*) also yielded less than usual, and prices are advancing.

Unfavourable conditions have also affected the crops of Clover seeds; that of red is small, and the seeds by no means full and bold, which is usually characteristic of those of German growth, and there are few old seeds on hand, while Clover is in larger quantities, but seeds of fine quality are scarce. Alsike is a small crop, but of exceptionally fine quality; it is dear also. Trefoil is an average crop, and fine in quality. Sainfoin is a small crop, and Lucerne promises to be very scarce and dear. *Pisum*.

THE ALPINE GARDEN.

SHORTIA GALACIFOLIA.

I would like to explain to Mr. C. W. Dod (see p. 219), that I was merely speaking as an individual when I said that the above presented "few, if any, difficulties to the cultivator." In saying this, however, I paid no regard to conditions over which the gardener has no control, as for example, altitude, atmospheric influences, and so forth. Such conditions are local, and it is quite possible that while this plant cannot be satisfied in Mr. Dod's garden, and with his wide knowledge of the supposed requirements of hardy plants generally, it may be grown with perfect ease within half a mile of his place. Soil, I quite agree, plays but an unimportant part in the successful culture of many alpine, a fact of which I became cognisant many years ago, owing to a varied experience in growing plants in various parts of this country, and in each and every case I noted the changed behaviour of many plants, while the treatment remained the same. One of my changes was from the flat district of Tooting to the highest part of Sydenham Hill, very near to the Crystal Palace, and here I learned and unlearned

many things in alpine culture; indeed, it was primarily the fresh experience of this locality that caused me to set aside the orthodox rules and adopt my own.

Few growers of alpine, I expect, have attempted the use of artificial manures in their cultivation, but I have used it freely in several instances. Some of my plants of *Saxifraga Burseriana* were treated freely with one of the best-known fertilisers, and these plants spread rapidly. It was my experience which caused me to write, some ten years ago, in a contemporary, that "soil plays only one part in the successful culture of any alpine, and if altitude and climatic conditions be not in harmony with the requirements of the plant, then no kind of soil will supply their places." The above is quoted from memory.

The culture of alpine plants in sphagnum moss is a complete negative to plants requiring this or that addition to the soil; still, I doubt not that even sphagnum moss will be influenced by atmospheric conditions, and that the experience on the mountain-side will differ greatly from that in the valley or lowland; for after all, with many plants, their very existence, not to say perfect success in their culture, depends more upon the air surrounding than upon the nourishment obtainable from the soil. Still, I hope that Mr. Dod's experience of the *Shortia* will not deter any one from attempting its culture, it being a beautiful plant in many ways. It may be encouraging to many to learn that its culture is quite a success at Kew—a proof, I take it, of its powers to resist smoke and town fog; and I believe I am right in stating that Mr. Dewar has no difficulty in growing the plant; certainly his plants were excellent when I saw them early last year. *J.*

BURFORD LODGE.

In the cool-house, in which flowering plants are generally arranged in Sir Trevor Lawrence's garden, Mr. Wm. Bain, the gardener there, has at present a beautiful display, in which tuberous *Begonias* predominate, and by far the more beautiful are those which are suspended under the roof, their large and gorgeously-tinted flowers having a more graceful appearance than when the plants grow on stages. This house, with its roof covered with white and red *Lapagerias*, is one of the prettiest sights one can imagine.

The outdoors garden always looks well, and somehow one always finds there some new or rare plants not before seen, or some old friend in better garb than previously observed. The beds of perennials, annuals, and biennials are brilliant with colour just now, and the *Gladiolus* and bulbous plants generally make a fine show. A large patch of *Salpiglossis* is very beautiful, and that finest of all hardy bulbs, *Criam Powellii*, is flowering in profusion. Rustic arches are turned over the walks in some parts, and these are clad with climbers. One of the prettiest is our old friend *Rhodochiton volubile*, whose purple calices are showy long after the flowers have fallen.

FORESTRY.

SEASONABLE WORK FOR SEPTEMBER.

TREE growth, both in Great Britain and Ireland, has in most cases made rapid progress, and, what is also of importance, most kinds of trees present a good appearance of seed, and as the seeds of several species become ripe during this month, they should be looked after, and gathered before they are shed and blown away by the wind. The Birch, *Betula alba pendula* (Smith), and the common White Birch, *B. alba* (L.), both ripen their seeds in early autumn, and as they are of a small light texture, they should be looked after, and collected at the proper time. The former, or what is generally called the Weeping Birch, is by far the finest ornamental tree; the best specimens are to be found on the banks of mountain streams, and on the shelving rocks on the bleak

sides of the Braemar mountains in Scotland. The contour of this tree, when fully established in its native glens, is simply magnificent; the bark on the stem is rough, corky, and deeply furrowed, and surmounted on the top by a canopy of strong branches, which ramify in all directions, and as these are well furnished with pendent sprays some 10 feet long, it imparts to the tree a light, airy, and graceful appearance, as seen waving in the wind, which is not surpassed, if even equalled, by any other tree with which I am acquainted. When the seeds are gathered, they should either be sown at once, or mixed with damp sand, and kept till spring. The best soil for the seed is that of a light mossy texture, formed into seed-beds 4 feet wide; sow the seeds broadcast, and trample them down on the surface with the feet, which is all the covering they require. I have, however, occasionally sown the seed at once on unreclaimed peat bog, as well as on Heather ground on the mountains of Scotland with perfect success, which is the natural way of propagating the tree. The seed may either be sown broadcast where the plants are to be allowed to remain without transplanting, or break the crust of the surface in spots here and there, and drop a pinch of seed on the spot, and finish by giving the spot a scuffle with the foot, which is all the covering they require. This is by far the best way of raising this tree, as they are a very uncertain crop in the nursery, and besides, transplanting alters the contour of the tree to a large extent. Gentlemen who wish to embellish their grounds with the best forms of the Weeping Birch should arrange to get their seed from the best form of the tree in the North, and sow them at once where the plants are to remain without planting out. This would give the trees a history, as the proprietor perhaps could tell his friends in after years that this fine tree is the progeny of the famous Birch at Hamilton Palace, Lanarkshire, sown by myself on the spot in 1892; or perhaps he might be able to say that some of his trees were the progeny of the historical "Birks of Aberfeldie," Perthshire, or the fine trees in the Highlands of Aberdeenshire. But be this as it may, I at any rate strongly advise all who wish to see the tree in its finest form of development to sow the seed on the spot. The treatment of the white Birch, *B. alba*, is in every respect similar; it is best adapted for coppice-wood, as it produces suckers more freely from the roots left in the ground where trees have been felled than that of the weeping variety. The Birch is the best tree I know for making up blanks in established Pine forests and woods, where the surface of the ground is coated with dead leaves and the exuviae of the Pine. As soon as the seeds are gathered, sow them at once on the surface without any preparation whatever, and the plants will appear above-ground in due course, and produce fine healthy trees where many other species of trees would perish.

Cherry-stones should now be collected, and sown at once on dry, friable ground; or they may be mixed with sand or dry earth, and sown in early spring on beds 4 feet wide, and covering them with about an inch in depth with fine soil.

Sycamore and other kinds of Maple seed should be collected as they become ripe; these had better be thoroughly dried, and kept in a dry place till spring. When sown in autumn, the plants are apt to be cut down with spring frosts. The Sycamore, however, often reproduces itself on the spot, and by a little care and attention the young plants may be trained into fine trees.

Different species of the *Abies* and *Picea* tribe of trees mature their cones in early autumn; these should be collected as they become ripe, and stowed away in a dry place till wanted in spring. Several of the Pine and Cypress tribe also ripen their cones in autumn, all of which should be looked after, and gathered at the proper time.

Thin out the superfluous shoots of young copse-wood, leaving the best in sufficient numbers for a crop. In damp, cloudy weather, plant evergreen shrubs both for covert and ornament, and in doing so, should a little soil adhere to the roots in the shape

of a small ball of earth, it will prove beneficial. Plant screen fences and hedges, and in all cases the ground should be well broken up, and pulverised with a pick, to render it pliable, and increase its fertility for the roots. When the soil is of a poor, thin texture, a little fresh soil added will prove an advantage. When planting ornamental stuff on cold, exposed situations, it is a capital plan to erect a small fence of evergreen branches on the most exposed side of the group or plant, as the case may be. I have always found shelter in such places to be a matter of great importance as a means of obtaining success. After the plants take to the soil, and become established, the branches or fence should be removed. In the nursery department, plant out seedling Hollies into nursery lines, allowing them space to branch out into stout, stocky plants. Dig between the rows of transplanted stuff to keep down weeds, and impart to the grounds a clean, tidy appearance. *J. B. Webster.*

PIERRE SONNERAT.

(1745—1814.)

(Concluded from p. 338.)

Sonnerat did not confine his observations to botany however; his drawings included careful representations of the people of India, their gods and goddesses, not omitting the famous Lingam as an object of nature worship, and the various incarnations of Vishnu, &c.

Subsequently, Sonnerat made several later voyages to India, where he resided for a length of time, being at Pondichéry as late as 1801, when he was fifty-six years of age. Having survived the fall of the Monarchy, he lived to see the Republic reconstituted, under the Empire of the great Napoleon, and died before the final overthrow of that Emperor, in Paris, on April 12, 1814. He has been reproached for too great credulity; but simplicity of character is scarcely a demerit in a world tending to agnosticism. His zeal for science, and his untiring exertions to introduce valuable and economical plants for the enrichment of the French colonies in the Indian Ocean, are deserving of the utmost gratitude which the appreciative colonists in Bourbon and Mauritius can bestow. To him they owe the introduction of the Bread-fruit, the Cacao, the Mango-steen, and several other fruit trees, as well as Spice-trees and Gum-trees of various kinds, now quite acclimatised in their islands.

M. Eyriès, in his notice of Sonnerat, in the *Biographie Universelle*, states that Linnæus named the Sonneratia, a tree of Malabar, the Moluccas, and New Guinea, described by Sonnerat under the name of Pagapaté. It is, he says, one of the monogynous Icosandriæ, and belongs to the family of the Myrtoideæ. In Sonnini's edition of Sonnerat's travels, he gives the name Sonneratia to the Wampi of China. *Capt. S. Pasfield Oliver, Moray House, Stokes Bay, Gosport.*

FLORISTS' FLOWERS.

CARNATION MARGUERITE.

LAST year I was somewhat disappointed with this Carnation, as the majority of the plants we raised came single; but this season there is a great improvement in them, and though the blossoms are small and thin, they are very useful, and will be more so by-and-by when winter sets in. It is certainly a very free-flowering variety, and comes quickly into bloom, as when sown and raised in March or April, buds are formed within three or four months, and the habit is good. Judging from its general appearance, I should think it will be valuable for breeding from, in conjunction with the perpetual kinds, which would be all the better for some of the Marguerite blood in them, as, excepting the well-known Miss Jolliffe, and one or two others, they are great stragglers, and not over free. It would be interesting to know how the Carnation Marguerite originated,

and anyhow, it is to be hoped that it will be taken in hand for purposes of hybridising and breeding from, as there seems something in it in that way; but no doubt, as we have so many active workers in that particular and interesting field of industry and pleasure, it has already been tried. *J. Sheppard.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 20.—A rather large display was made on this occasion in the Drill Hall, James Street, Westminster, Orchids, Dahlias, hardy perennials, Gaillardias, and a considerable quantity of fine fruit being staged. The lecture on Hardy Perennials, by Mr. C. W. Dod, and read by the Secretary, was particularly bright and interesting. A *résumé* of it will be found on another page.

Floral Committee.

Present: J. Fraser, Esq., in the chair; and Messrs. O. Thomas, B. Wynne, R. Owen, G. Phippen, H. B. May, C. T. Drury, F. Ross, W. C. Leach, J. Walker, C. F. Bause, W. Bain, C. Jeffries, N. Davis, E. Mawley, T. Baines, C. Noble, H. Turner, G. Paul, W. Watson, H. D'Ombraim, T. W. Girdlestone.

Some beautiful flowers of Streptocarpus, seedlings of the present year, seed having been sown in January last, came from Messrs. J. Veitch & Sons, Chelsea, receiving a Vote of Thanks.

A pretty group of Ferns, consisting chiefly of variegated varieties of Pteris, and of varietal forms of Adiantum. *P. nivalis* has silvery pinnae, with a thin green edge, the lower frond pinnate and sub-erect, taller ones in the heart of the plant being sparingly furnished with narrow pinnae (a First-class Certificate). Other Pteris were *Reginae*, variegated in a similar form, but bolder, as was also the style of growth; *P. Reginae cristata*, *P. Victoriae*, with a silvery band running down the middle of each pinna; *Adiantum decorum*, and *A. diversiforme*.

From the gardens of Miss Alice Rothschild, at Eythrop Park, Aylesbury, came a boxful of silver variegated Elder, with fine cut leaves (Award of Merit).

Mr. F. Ross, Bletchley, showed *Aristolochia gigas* Sturtevantii, with one enormous bloom of an evil smell, but beautifully marked with purple spots on a billowy-white ground, the centre being a patch of reddish-purple. The flower, when fully expanded, would measure 1 foot in width, and in length, with the tail, about 4 feet. The plant was not yet one year old, and it had been raised by Mr. Ross from a cutting.

A few *Chrysanthemums* came from Mr. R. Owen, Castle Hill, Maidenhead; Harvest-home was a rich bronze, with incurving tips to the petals, which are yellow. He also showed two white varieties.

M. C. Smith, Esq. (gr., Mr. Quarterman), showed a quantity of Pine-cones, mixed with toadstools, and stuck in hampers of moss, perhaps to afford an example of decoration (Vote of Thanks).

From Messrs. J. Laing & Sons, Stanstead Park Nurseries, S.E., came a novel-looking tuberous Begonia flower, named W. Allen Richardson, a number of them, in fact, set off on a stand covered with black velvet. The colour is nearly identical with that of the Rose of that name. It is pretty, and useful as a bouquet flower, and for other purposes. The same firm contributed a group of miscellaneous stove and greenhouse plants, stands of cut Begonia blooms, several new varieties in ornamental-leaved Begonias, viz., *Louise Closson*, and *Arthur Malet*. A late-flowering Cliveia, *Lady Wolverton*, was noted amongst the flowering subjects (Silver Gilt Flora Medal).

Messrs. B. S. Williams, Paradise and Victoria Nurseries, Upper Holloway, N., showed an excellent group of all the showiest Crotons, clean, healthy and bright (Silver Gilt Flora Medal).

A group of miscellaneous furnishing plants of the stove and greenhouse, was shown by Mr. C. Holdene, Harwick Road, Ealing (Bronze Banksian Medal).

The showiest table of flowers was that of Messrs. Dobbie & Co., Rotheagay, N.B. It consisted of *Violas* of numerous colours, Dahlias, Antirrhinums, self-coloured and striped; Marigolds, French, African; and various *Calandulas*. Fuchsias, unfortunately shown as Fuchsias do not grow, that is with the mouth of the flower turned upwards. The firm showed examples of their selections of Parsley, Carrots, Turnips, Onions, Champion Leek, &c. For the floral group, a Silver-gilt Medal was

awarded; for the superior strain of French Marigolds, an Award of Merit; and for the Leeks, a Cultural Commendation.

Herbaceous plants, in many fine showy species, were shown by Messrs. Paul & Son, The Old Nurseries, Chessunt. A very richly-coloured Phlox was shown by them, under the name of *Eclairure*, a new shade of purple (Bronze Banksian Medal).

We saw, no doubt, the last of the Dahlias of 1892 on this occasion. On Sunday morning a sharp frost visited many of the Dahlia gardens; some say there were 10° in places, and the tender foliage of the plants was considerably injured. The wonder was, so many flowers were seen, and in such good condition. Mr. C. Turner sent a small collection of new varieties, including Show Dahlia Kathleen (Award of Merit), pale ground, suffused with pink, and slightly tipped with purple, fine petal shape and centre, a good addition to the light varieties; also Mrs. Morgan, a light flower, bluish ground, suffused with lemon at the base, and tipped heavily with purple in the centre; and Reginald, bright crimson, shaded with maroon, and suffused with purple on the basal petals—good centre; also Cactus Dahlia, Oscar, dull orange-scarlet, good shape; and the following new Pompon varieties: *Minerva*, yellow, slightly tipped with brown in the centre petals, small well-formed flowers. *Idalia*, bright wine-crimson; small, fine shape. *Gypsy Queen*, maroon, flushed with crimson on the petal edges; small, well-formed. *Boule d'Or*, yellow, the basal petals flushed or edged with brown. *White Lady*, a seedling from *White Aster*; an improved *Lady Blanche*. *Pluto*, pale purple, deeper on the edges. *Ringdove*, bright terra-cotta, a new colour, very distinct; and *Percy*, white, with side edgings of deep crimson—small, well-formed.

Mr. T. S. Ware, Tottenham, had the nearest approach to a white Cactus Dahlia we have yet seen—white, with yellow centre, distinct and promising, but not in good condition; and single, Mrs. Henshaw, bright deep orange-crimson, fine shape. From Mr. J. T. West, The Corwalls, Brentwood, came show Dahlia Edward Sheerman, in the way of Arthur Rawlings, but darker, having more maroon, and bright crimson edges, good petal and edges; and a number of blooms of Pandora, a light variety sent out about five years ago by Mr. C. Turner, in the way of Maud Fellowes, with more pink on the petals, said to be very constant in the North; also the following new Pompon varieties—*Tommy Keith*, white with side markings of crimson (Award of Merit); *Arthur West*, bright claret-crimson, very compact and fine shape (Award of Merit); *Gipsy*, crimson flushed with purple on the base petals; *Sunshine*, bright orange-scarlet, fine colour, small and compact; *Mary Kirk*, pale primrose-yellow, slightly flushed with brown, good shape; *Revenge*, bright pinkish-lilac, with side-margins of crimson, distinct in colour; *Little Sweetheart*, like *Tommy Keith*, but with side margins of scarlet instead of crimson; *Winifred*, white with slight purple tinge on the centre petals; *Mars*, deep scarlet, fine shape; and *Eva*, cerise flushed with crimson—indeed, a very fine lot of Pompons. Also decorative Dahlia Stebbing Wheeler, yellow, flaked with orange-scarlet; and Cactus Joseph Chamberlain, pale scarlet, but not in very good condition. In addition, Mr. West staged a collection of over one hundred show flowers in great variety. Mr. Arthur Rawlings, nurseryman, Romford, had a collection of 150 show Dahlias, twenty-four of them being varieties raised and distributed by him, and it must be confessed they are among the finest in cultivation. A new show Dahlia Mrs. Page (Rawlings), rose, flushed with lilac-pink on the edges, is new in colour, and highly promising. Mr. S. Mrtimer, nurseryman, Farnham, also had a collection of eighty-five blooms of show varieties. Messrs. Perkins & Sons, nurserymen, Coventry, had Cactus Dahlia Matchless, rich shining maroon, the basal petals flushed with deep crimson—very fine and distinct (Award of Merit); Cactus Purple King, and a single named *Scarlet Perfection*, bright scarlet—fine shape.

Orchid Committee.

Present: Dr. Maxwell T. Masters in the Chair; and Messrs. Jas. O'Brien (Sec.), Sydney Courtauld, T. B. Haywood, Jas. Douglas, W. H. White, H. Williams, F. Sander, Chas. Pilcher, J. Jaques, T. W. Bond, and E. Hill.

Thos. Statter, Esq., Stand Hall, Whitefield, near Manchester (gr., Mr. R. Johnson), exhibited two distinct and beautiful Cattleyas, viz., *C. Statteriana*, a fine thing, with flowers as large as those of *C. Hardyana*, and similar in form. The sepals and

petals were nearly white. The handsome lip is crimson at the base with heavy golden veining, the mid-area rich yellow, with a few purple marks. The front of the lip is rich purplish-crimson, and around the whole of it runs a crimped rosy-crimson margin; it is very handsome, and nothing like it has yet been shown (First-class Certificate). The other was *Cattleya aurea Statteriana*, which had previously received a First-class Certificate; its flowers were almost wholly rich yellow, the only other colour being a few dark crimson markings at the base and up the middle of the lip, and a narrow rose marbling at its edge.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, Chelsea, S.W., showed a new hybrid, *Cattleya* × *Minacia* (Loddigesii ♀, *labiata* var. ♂), a very pretty dwarf variety, with a flower resembling a small *C. labiata*, but with distinct evidence of the other parent in the lip (Award of Merit).

Messrs. F. Sander & Co., St. Albans, staged a small group of Orchids, comprising a good selection of *Cypripedium Maynardii* ×, one of the varieties being curiously marbled; several *C. Chamberlainianum*, *C. picturatum* ×, *C. Eyermanianum* ×, *C. radiosum* ×, *C. Macfarlanei* ×; eight plants of *Dendrobium Phalenopsis Schroderianum*, two of *Vanda cœrulea*, *Cattleyas*, *Odontoglossums*, &c. (Vote of Thanks).

Messrs. Hugh Low & Co., Clapton, E., also had a group made up of many *Vanda Kimballiana*, *V. cœrulea*, *Cattleya bicolor Wrigleyana*, *Dendrobium formosum giganteum*, and other species well arranged with Maidenhair Ferns (Vote of Thanks).

W. Walker, Esq., Brettargh, Holt, Kendal, sent two fine specimens of *Saccolabium Blumei*, each with twelve spikes (Vote of Thanks).

Geo. Hardy, Esq., Pickering Lodge, Timmerley (gr., Mr. W. Holmes), sent a spike of true *Vanda insignis*.

Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, exhibited two species of *Cyrtopodium*, which, not being sufficiently advanced, the committee desired to see again. The same firm also sent a plant of *Odontoglossum præstans*.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, showed a plant of *Oncidium incurvum album*, which received a First-class Certificate in 1884, but is still extremely rare.

J. Foster Alcock, Esq., Northchurch, Berkhamstead, exhibited a plant of *Catasetum* with seven of the usual large white male flowers, and one of the helmet-shaped lipped female flowers on the same spike (Vote of Thanks); and C. L. N. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), a hybrid *Cypripedium* which had *C. Harrisianum* for one of its parents.

Fruit Committee.

Present: P. Crowley, Esq., in the Chair; and T. Francis Rivers, R. D. Blackmore, W. Wilks, G. Taber, T. J. Saltmarsh, A. Dean, J. A. Laing, G. Cliffe, W. Bates, G. Wythes, J. Hudson, H. Balderson, G. Norman, W. H. Divers, J. Willard, Arnold Moss, and G. W. Cummins.

From the Society's Gardens, Mr. Barron had brought forty dishes and varieties of Potatoes, fair samples and mostly mature so far as a cursory examination disclosed.

Messrs. G. Bunyard & Co., showed Hills' Prize Runner Beans, large, straight, rather smooth-skinned pods 9 inches long (First-class Certificate).

A Runner Bean, Prizewinner, was shown by Messrs. Sutton & Sons, Reading. It has a pod of 7 inches in length (First-class Certificate). A new Melon from Mr. Tegg, gr. at Bearwood, Wokingham, a finely netted yellow flesh, red variety, obtained an Award of Merit. Seedling Melons were shown by different exhibitors, but none was adjudged worthy of an award.

A yellow-fleshed Tomato, named Uppertorpe Orange, was shown by Mr. E. D. Smith, gr. to J. Middleton, Esq., 132, Uppertorpe, Sheffield. It is the size of a Coe's Golden Drop Plum, and very prolific.

Messrs. J. Carter & Co., High Holborn, showed their Tomato Blenheim Orange, a large-fruited yellow variety, and a great cropper. It proved to be of very good flavour, and received an Award of Merit.

Mr. W. A. Shaw showed a Tomato—Mitchell's No. 1; it is a heavy-cropping variety, somewhat corrugated, as are most of the best hearers.

Some showy Pears came from Mr. Bannister, gr. to H. Saml. Vincent Ames, Esq., Cote House, Westbury-on-Trim. A quantity of Apples, grown in a back garden within the three miles radius from Charing Cross, by Mr. Bodley, 99, Loughborough

Park, S.W., were mostly nice-looking specimens (a Cultural Commendation).

Milner's seedling Apple was shown by Messrs. J. Laing & Sons, Forest Hill, S.E. Mr. E. Molyneux, gr., Swanmore, Bishop's Waltham, was poorly awarded with a Vote of Thanks for two dishes of excellent Worcester Pearmain Apples.

Some ripe fruits of the Mango were shown by Lady Theodora Guest, Inwood House, Henstridge, for which a Cultural Commendation was given.

The rarely-seen fruits of *Ribes sanguineum* were shown by Mr. S. Mortimer, Swiss Nursery, Farham. They resemble in colour and arrangement on the stalk the Black Currant, but they are simply sweet, without any flavour whatever (a Vote of Thanks).

Some high-coloured Peaches came from Mr. J. Willard, and Tomatos from Mr. Leach.

Very showy and large seedling Peaches and a Pear came from Messrs. Rivers, Sawbridgeworth; also examples of the Peaches Albatross, Sea Eagle, and Princess of Wales, all grandly developed; very fine examples of Ribston Pippin and Monarch, and other varieties of Plums, and a seedling Plum. A Silver Banksian Medal was awarded.

Mr. Owen Thomas, gr. to the Queen, Frogmore, made a grand display of fruits in season, viz., Grapes: Lady Downes' Seedling, unusually large at the shoulder, and fine in colour, bloom, and size of berry; some splendid Raisin de Calabre, Black Hamburg, from the Hampton Court old Vine, and from Cumberland Lodge, those from the latter being much the finer in bunch and berry. Twelve examples of Smooth Cayenne Pines, 7 or 8 lb. each, perfect fruits and perfectly ripened; a number of Melons, including High Cross Hybrid and Hero of Bath, nothing abnormally large, but good of flavour, doubtless; twenty dishes of Plums, of the best dessert varieties; sixteen varieties in as many dishes of Nectarines, and twenty-two of Peaches, mostly large and high in colour; and a number of dishes of Pears, Apples, Quinces, and Mulberries. A Silver-gilt Knightian Medal was awarded for this fine exhibit.

The following awards were made for Potatoes:—

First-class Certificates.

To Potato Reading Giant, shown by Mr. Fidler, Reading.
To Potato Mary Anderson, shown by Mr. Fletcher.
To Potato Boston Q. (Q., shown by W. W. Johnson & Sons.
To Potato The Canon, shown by R. Dean, Ealing.

Awards of Merit.

To Potato King of the Earlies, shown by Mr. Ridgewell.
To Potato Crutley Prizetaker, shown by J. Cheal & Sons.
To Potato White Round, shown by Paul & Son.
To Potato White Russet, shown by Mr. Harris.

THE LECTURE.

The usual afternoon Lecture was furnished by the Rev. C. Wolley Dod in the form of an admirable and interesting paper, read in excellent style, by the Hon. Secretary, the Rev. Mr. Wilks, the subject being "Variation of some Hardy Plants under Cultivation." The paper was divided into certain sections, dealing with fertility or otherwise of certain wild plants when cultivated; also variations as to habit or height of coloration of flowers, of doubleness, &c. Wild flowers, it was said, did not show any appreciable evidence of improvement in their native condition, but did so appreciably under cultivation. This was ascribed to the fact that in a wild state, not more perhaps than one seed in a thousand grew, whilst in the cultivated state nearly all grew. Hence, the range for selection was so much greater; and such selection of course leads to the securing of the best and finest forms—hence, the improvement. Considerable differences were found in Mr. Dod's own garden, and it was from observations made therein that the paper was based. In plants, resulting from several years cultivation, changes were seen in the stature, in luxuriance, in size, as well as in colour of flowers, and in seed production. In relation to these matters, errors arising from careless observation arose, thus leading to incorrect conceptions. Thus, he had never found the single wild Daffodil or the common wild Primrose, to change into a double. These plants vary very much in height when transferred from high altitudes to low gardens, and in some cases have smaller flowers, but he had found *Ranunculus amplexicaulis* to produce larger flowers. Various plants were mentioned that increase materially in dimensions under cultivation. Others were named that will not show in gardens that same robust habit found in a wild condition. Changes of colour in flowers were due to cultivation, as found in Primroses, Polyanthus, Pyrethrums, Hyacinths, &c. How few wild Primroses show variation in colour; now and then some, though very rarely, are white,

others reddish. A variety of a *Veronica* at Jlandudno had not only white flowers, but other colours also—a rare instance. In his Cheshire garden, the white Mallow became largely pink after the introduction of the wild pink form, and all the coloured ones had to be pulled out to keep the white form true. *Geranium Robertianum* became nearly all white with him. The white Foxglove became so much coloured, that the true thing could only be secured by constantly purchasing seed. The next class of changes dealt with was that arising from crosses with other forms of the same species. It had been found that the progeny would so assimilate the characters of the parents as to obliterate their identity. *Aquilegias* were very susceptible to variation in this way. The alpine *Dianthus* vary greatly, and freely intercross. The Mullein hybridises freely, but all products are barren. The Jacob's Ladder will also greatly vary. The following species will produce variations:—*Campanulas*, *Linum glabrum*, *Scillas nutans* and *campanulata*, some *Geraniums*, *Inulas*, *Hellebores*, &c. Cases where plants nearly related never intercross naturally are *Crocuses*, *Narcissi*, *Anemones*, *Ranunculuses*, and *Gentians*. Then was asked, Does cultivation increase or decrease seed-bearing in plants? Mr. Wolley Dod believed generally that increase resulted; there were, however, exceptions, as he had found *Helianthus multiflorus*, single and double, and a variety of *Veronica*, probably subsepalis, to be always sterile. Some other plants were mentioned that never seed. Lastly, was referred to, the question of doubling of flowers, this was not attributed to higher cultivation, but rather was a sportive development produced by cultivation. The Rev. Mr. Henslow, at the request of the chairman, Mr. G. Paul, briefly referred to some of the points raised in the paper, and said he should have much liked Mr. Dod to have been present to have put to him several questions. For instance, Why did some plants become dwarfs? He mentioned the experience of Dr. McNab, who raised a dwarf race of *Rhododendrons* from seed by using pollen from the shortest stamens. Practical observations in the direction referred to were necessary. An interesting case was quoted by Mr. Henslow of a shrub that Mr. Meehan, the American botanist, found always sterile, until on one occasion a branch produced seed, and an examination of some late flowers showed, in this case, the stamens and pistil were of equal length. No one else cared to rise on invitation, and a cordial Vote of Thanks was awarded to Mr. Wolley Dod. This is a rough outline, but a perusal of the paper in its entirety in the Society's *Journal* will be well repaid.

DURHAM FLORAL.

SEPT. 13, 14.—The twentieth annual show was held in the Durham New Market and Town Hall, on Tuesday and Wednesday. The Society has had a hard struggle for existence during recent years, and the officials are worthy of great praise for the courageous manner with which they have kept it to the fore in the district. As against previous shows there was a marked excess of exhibits, and the quality of these must be classed as very good.

In the open class the specimen stove and greenhouse, foliage and flowering plants were magnificent, and amongst the latter were some grand specimen *Ericas*. The foliage plants were of much excellence, and very fresh-looking; and the same may be said of the Ferns and Fuchsias.

Cut Flowers.—The competition in these was very strong; the bouquets and the *epergnes*, and the baskets of flowers, were excellent. Messrs. Perkins & Son, of Coventry, taking in the latter all the leading prizes.

Roses, Dahlias, Asters, *Gladiolus* were all fairly represented; also Marigolds, Pinks and Carnations. The collections of stove and greenhouse cut flowers, and the herbaceous cut flowers, were remarkably good, and their numbers made this part of the show most interesting.

Fruit.—Excellent Grapes were shown in quantity, and the entries for the collection of six distinct dishes brought some close competition—so much so, that the 1st and 2nd were eventually placed equal 1st. Peaches, Apricots, Apples, Pears, Currants, &c., were fairly shown.

Vegetables, all round, left nothing to be desired, and the competition was severe.

In addition to the above, there is an industrial show of needlework, paintings, drawings, photography, and writing—an interesting part of the show, and one that is greatly patronised by the inhabitants.

THE BULB GARDEN.

DAFFODILS.

THE planting season for these bulbs will soon be upon us, and a few notes of my experience with some of the varieties, may afford the readers of this journal a few hints as to position, soil, aspect, &c. I find the varieties of these flowers vary considerably in the way they succeed here, and, however interesting some of them may be from a collector's point of view, there is too much sameness about some of them when looked at merely as garden flowers. Possibly a little peculiarity of soil may account for some varieties not succeeding so well here as others. For instance, *obvallaris*, *maximus*, *major*, *cernuus pulcher*, *spurius*, *albicans*, *James Walker*, *Barrii*, *Sensation*, *Mrs. George Cannell*, and *Mary Anderson* have all failed to a great extent, and some are altogether dead, while other varieties, under exactly the same treatment, have increased very fast. *N. Bulbocodium* has also disappeared, but I am not surprised at the loss of this, since I have seen it grown as a bog plant, which is evidently the best treatment to give this species; the improved size of its flowers, under such conditions, is surprising. I have not seen any other variety grown in this way, but those kinds which do well with us are grown on a very dry border facing south, in a limestone soil which has been improved with additions of burnt earth, &c., our whole collection, which amounts to nearly fifty kinds, being grown under similar conditions.

The variety that has increased the most is *Leedsii Queen of England*, in six years this has increased an hundredfold; it is a very pretty white-flowered variety. *Duchess of Brabant*, *Madge Matthew*, *Leedsii Gem*, and *Minnie Hume*, are all very similar to it in appearance, so much so indeed, that only one of the five kinds is required under ordinary circumstances. *Sir Watkin* is a good grower here, but does not increase so fast as most of the *Incomparabilis* section; it should be in every collection of spring-flowering plants, as its striking appearance commands attention at once even when growing among a quantity of other kinds. The same may be said of *Leedsii Figaro* with the exception that it increases faster, it runs *Sir Watkin* very closely for size when well grown; other good and distinct kinds which do well here are *Barrii conspicua*, *Barbidgeii*, *T. M. Absolon*, and *Katherine Spurrell*.

Of the *Ajax* or trumpet section, *N. minor nanus* is small, but is the earliest to flower, and is a favourite with most people; it opened here this season on March 26. *Yellow King* was only four days later, and is a kind that ought to be in every garden; it seeds more freely here than other kinds. *N. princeps* commenced to open on April 4, and a fresh batch of it from Ireland is doing well, previous lots having failed to a great extent; it is a good useful variety, if it can be made to grow properly, paler in colour than *Yellow King*, but similar in size. *Emperor* flowers well with us, and increases fast; it is a fine large self-coloured variety, of an excellent constitution. *N. bicolor Horsfieldii* is also a great favourite with us, as it is one of the most vigorous growers, and a fine large flower, with yellow tube and white sepals; it commenced to open on April 6. *N. bicolor grandis* is very similar in appearance to the preceding, but both ought to be grown in every garden, the latter variety flowering much later, and thus keeping up a succession; it commenced opening here on April 21. *N. Empress* is very similar to the two last kinds, and as it flowers before *Horsfieldii* is over, it is not required where the other two are grown. We have none of the scarce varieties in this section, some of which are quoted at four guineas per root, so I am unable to say how they succeed. Certainly the flowers are very fine.

N. poeticus ornatus is a great improvement on the type, the sepals being nearly twice the width, and not so apt to curl; it is also fully three weeks earlier in flowering. *N. poeticus poetarum* is not so distinct, although it is much larger than the old variety.

The double kind, sometimes called "Gardenia flowered," is very useful where pure white flowers are in demand; it is also a good grower, and constant in character with us, but occasionally fails to open its flowers. This occurs chiefly in dry, warm weather. *N. odoros rugilobus* is a decided advance on the type, which is also known as the *Jonquil*, but the improvement in the form of the flower is at the expense of the perfume, although a considerable portion of this is retained.

The old-fashioned double varieties, known as *Butter and Eggs*, *Eggs and Bacon*, *Codlings and Cream*, are not so pretty in my opinion as the single kinds. I find the two former varieties do well here; the other is not so robust, but is the finest flower of the three, sometimes measuring nearly 4 inches across—it is also nearly white, which enhances its value.

Like many other plants which the gardener has to deal with, we are now getting too many varieties of Daffodils. It is true there is a distinction between them, but at a few inches distance it is impossible to perceive it; for instance, *N. Leedsii Queen of England*, *Duchess of Brabant*, *Madge Matthew*, *Gem*, and *Minnie Hume*, are all very much alike. The same may be said of *N. Leedsii amabilis*, *sulphureus*, *Astræa*, *Leedsii Figaro*, and *concolor Autocrat*, among yellows; and *albidus*, *Annie Baden*, *Burbidgeii*, *T. M. Absolon*, among the two-coloured varieties in this section.

A selection of distinct single varieties in their order of flowering, and which succeed the best here, is as follows:—*N. minor nanus*, *N. Yellow King*, *N. princeps*, *N. bicolor Horsfieldii*, *N. Sir Watkin*, *N. Leedsii Queen of England*, *N. Emperor*, *N. Katherine Spurrell*, *N. Leedsii Figaro*, *N. bicolor grandis*, *N. Barrii conspicua*, *N. poeticus ornatus*, *N. Burbidgeii*, *T. M. Absolon*.

Daffodils are seen to the best advantage when flowering, if they are grown in clumps among other spring-flowering plants, such as *Myosotis*, self-coloured *Primroses*, *Muscari* of various colours, and especially *Anemone fulgens*, *A. apennina*, *A. vernalis*, &c. *W. H. Divers, Stamford.*

NURSERY NOTES.

J. R. BOX, CROYDON.

JUST opposite to the West Croydon station of the Brighton railway there is a very attractive seedman's shop, which is the central place of business of Mr. Box, who, as an energetic trader, has made for himself an excellent reputation in what is the most populous town in the county of Surrey. Like so many other florists in these days, beyond conducting the ordinary business of a nurseryman, Mr. Box has developed into a sort of specialist also, for he, too, is a Begonia grower in a considerable way. To find the Begonias, however, it is needful to ride per tram a mile down the London Road, when the nursery is easily reached. Here the first thing which attracts attention is the extensive use made for bordering that striking Begonia of the *semperflorens* type, *Atro-purpurea*, which has dark metallic leafage and red flowers, and which is a continental introduction. The really attractive forms are those of the now popular *tuberosus* section, which in a series of beds are close by, doubles on the one side, singles on the other, all in beds of some six rows each at about a foot apart, the plants being 7 inches apart. Of course, that is a method of planting not to be commended for ordinary decorative purposes, but in the case of thousands of seedlings it is indispensable. Seed is grown in January, and later the plants are grown on in shallow boxes; from those in June they are transferred to the open ground, and planted thickly as described. Here the bloom is profuse, and the entire body of beds give very beautiful floral effects. The flower seems to be materially dependent upon the nature of soil. If that be too rich, gross growth and luxuriant leafage results, with perhaps the finest tubers. Poorer soil is productive of most bloom. In all cases a liberal supply

of water is essential for Begonias. As all the myriads of seedling plants are from seed, saved first in colours, and second as singles or doubles; the question naturally is asked, what proportion of the plants come true to variety? So far as colours are concerned, it is found that they come true from seed in the proportion of from 80 to 90 per cent. So far as doubles come true to character, the proportion is about 50 to 60 per cent. Singles very rarely indeed show double form, but doubles revert largely to the single form, though it seems to be a fact that the deeper colours gives the best average, whilst both forms gives a wondrous variety in colour and shading; there is, perhaps because of the multiplicity of petals, more refinement in shading in the doubles. On the other hand, the large bold petals give the finest effects. Now Mr. Box has of colours, white, flesh, pink, bicolor, white shading to red or deep colours, rose, orange, flowers not so large as in other cases, but exhibiting various lovely tints; scarlet, the richest of all for massing; crimson, &c. Because of the exceeding freedom of bloom seen here, the effect of the masses of bloom given by the numerous beds is almost dazzling. Evidence of the quality of the strain is found in the dimensions of the flowers, which frequently run from these small seedling plants to 4 and 5 inches in diameter, whilst the remarkable development made of late in the side petals, have now resulted in the production of almost perfect rounded flowers. With regard to doubles, *Davisii flore-pleno*, was thought to be the richest crimson double, but seedlings now show that it is left behind in intensity, as well as in size of bloom. Some continental forms, notably *Charlemagne Denizart*, exhibit what may be termed *Carnation flaking* in a modified degree, and we may look presently for a race of flaked double Begonias.

In a small nursery nearer the town, Mr. Box grows a good selection of choice *Caladiums*. We learn that new varieties, and in enormous quantities, are to be had from Rio Janeiro, where one grower devotes acres of ground to their cultivation, and from whence come many of the finest novelties. Of newer forms, *Mrs. Harry Veitch* has intense red leaves; *Comte de Germiny* has red leaves, spotted white; *Louis van Houtte* has rich red foliage; the old *Chantini*, and *Prince Albert Edward*, are of the best popular forms; and very beautiful are *Caspard Crayer*, *Madame John Scheffer*, and *Reine Marie du Portugal*. There seems to be a growing demand for *Caladiums*, and the wondrously rich-leaved forms more recently introduced indicate that the capacities of the *Caladium* are hardly yet realised. There is here a good stock of the varied *Ficus elastica*, which will presently be in great request. *Crotons* in variety are good; so, also, is a large stock of *Eucharis amazonica*; and there is an excellent strain of *Gloxinias*. The climbing *Asparagus* is here trained somewhat after the continental fashion, in sharp cones, up string, running from the edge of the pots to the top of a centre stick, only that abroad the growers use green string. Mr. Box is evidently a smart business man, and has a good connection. There is a big trade just now being done in imported bulbs, and of allied roots.

MESSRS. REID & BORNEMANN, SYDENHAM.

Persons seeking the place of business of this partnership of energetic and intelligent young Germans, will reach it in less than ten minutes' walk from Sydenham Station, L.B.R., taking on the right down the road the third turning. The place is somewhat new, has had much licking into shape, and needs yet much more; but it will be all in order in good time. From the front entrance to the nursery proper, which lies away behind the houses, runs a wide roadway, and on either side are broad beds of Begonias, for these popular flowers here form a specialty, and are grown in immense quantities. Here, too, one sees the respective sections and colours well preserved and separated, and average quality is of the very best. Apart from the production of fine strains for pot culture and bedding, the firm have given some attention to the development of perfume in the Begonia, and a sweet-scented strain may be

regarded as amongst the possibilities of a not remote future. One plant, a violet-shaded semi-double, has distinct Violet perfume. Possibly this perfumed strain may eventuate in giving us bluish-tinted flowers. Crossing Begonia Baumanni with the pointed-leaved tuberous section, has resulted in the production of seedlings, many of which, whilst of very compact growth, have quite rounded leaves. From crosses of this kind it is hoped may eventuate a very distinctive strain in habit, as well as securing perfume. The best Begonias are inside in great variety and beautiful leafage; and of Amaryllis of the best strains, the firm raise thousands annually, a big sowing is just germinating, whilst myriads of plants may be seen in divers stages of growth. Seedlings flower about the third year, and from the seed stage until blooming time should not be allowed to rest. Next spring, a large batch may be expected to flower. That the interest in zonal Pelargoniums is not exhausted is evident, because here not only are ordinary forms being intercrossed and seeded, but many fine seedlings are blooming; and there are a few plants of an almost miniature or dwarf strain, of various colours, from which genuine bedding varieties may develop, which would supersede the too coarse hedders of the present day. A very fine double white is, perhaps, the most promising of the strong growers; the pips are as fine as are those of Raspaill.

Roses do well outdoors, especially on the seedling Briar, and there are large batches of double Carnations seeding apparently pretty well. After all, the chief speciality at this season is found in Chrysanthemums, of which the firm have some 2500 strong plants in pits; besides which there are about 500 seedlings, many of which are from own-saved seed. Mr. Reid is an enthusiastic hybridist, and carries his camel's-hair brush with him everywhere, so that no opportunity to secure a successful cross is lost.

It is too early to note what results have come from his labours appreciably, but in one of the houses a large number of plants have flowers in various stages of development, especially of what may be called the October section. "For," said Mr. Reid, "it is certain that we shall soon have, of Japanese forms, varieties as fine, as varied, and as plentiful as we have of November varieties." That result will be found useful, not only in giving a long season, but of rendering possible a series of October Chrysanthemum shows, and thus relieving November of what is at present very undue pressure.

In the production of imported seed from Spain and Portugal, we learn that insects are the chief fertilisers, but their work has neither aim nor connection. The human fertiliser, on the other hand, works for the securing of specific objects; hence the results from intelligently-fertilised flowers are so much better. Mrs. George Jones, somewhat of the Louis Bœhmer form, becoming pure white, promises to be a fine flower. So too does Souvenir de M. Menier, large flowers, colour of Jeanne Delaux. Ulrich Branner is a very fine tasselled form, of crimson-chestnut colour. M. G. de Dubor is a handsome reflexed flower, gold ground, with bronze shading. Another, Carl Kaiser, has crimson-red petals, shaded brown, and tipped gold. Mr. R. Brabant is coming on in fine form, so too is W. H. Lincoln, in its rich yellow lustre; and the pure white Anna Hartshorn is very fine.

However, the great show of Chrysanthemums at Earl's Court next month will enable the firm to show all their new early varieties to the best advantage. Of course the stock includes all the best forms of the day; but the novelties, both from the continent and English raising, are so numerous, that selection becomes bewildering. However, the trade growers like the firm at Sydeham, have to bear the brunt of the testing, and the private grower benefits by their considerable and none too profitable labours.

which occurred on Tuesday, the 6th inst., at the ripe age of eighty-six years. His interment took place at Lydbury, North, on Saturday, the 10th inst., and was attended by a number of the employes of the Right Hon. the Earl of Powis. It may be interesting to our readers to learn that the late Mr. Bond was in his youth in Kew Gardens, and his first visit to Walcot, the Shropshire seat of the Earl of Powis, was to paint a sketch of a very fine specimen of the Mango tree. Subsequently, he accepted the position of head gardener, which he retained for the long period of forty-seven years, during which time he served three Earls of Powis. By the last, owing to his advanced age, he was pensioned off, and has for eight years enjoyed his well-merited repose. There is at present in the "Walcot grounds," a very fine specimen of Douglas Fir, planted by Mr. Bond on March 22, 1842; on May 12, 1892, it measured as follows:—Height, 107 feet to the top of leader; girth, 12 feet 9 inches at 4 feet from the ground, and is estimated to contain 400 square feet of timber. As a master, Mr. Bond was kind and considerate, deservedly respected by his employes, and his retirement from the active duties of life was much regretted.

SAMUEL FARQUHAR.—There was laid to rest in Echt churchyard on Saturday, the 17th inst., the remains of Samuel Farquhar. Mr. Farquhar, who had reached the age of 86 years, was for the long period of 52 years head gardener at Dunecht House, near Aberdeen, and during that time he enjoyed the esteem of the former proprietors, Mr. Forbes and the late Earl of Crawford and Balcarres. His tenure of office was no insecure, and in particular during the time the laying-out of the lawns and policies of Dunecht House was in progress the whole of the work devolved upon Mr. Farquhar. The successful manner in which he carried out the arrangements amply justified the confidence reposed in his ability by the Earl of Crawford, and has been the source of general admiration. On account of advancing years Mr. Farquhar relinquished his post at Dunecht House in 1877, and since then has resided with his son, Mr. J. Farquhar, agricultural auctioneer, Old Echt.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
- 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending September 17, is furnished from the Meteorological Office:—

"The weather was fair and dry over the greater part of the Kingdom; but, dull, unsettled, and very rainy over the northern and western portions of Ireland and Scotland.

"The temperature was again below the mean in the north and west, but just equalled it in many parts of England, and slightly exceeded it in 'England, E.' The highest of the maxima were registered on rather irregular dates, and ranged from between 70° and 73° over the southern, eastern, and Midland districts, to 62° in 'Scotland, N.,' and 59° in 'Scotland, W.' The lowest of the minima were recorded at most stations during the middle part of the week, when the thermometer fell to between 33° and 40° over England, between 36° and 38° in Scotland, and to 34° in Ireland, but only to 45° in the 'Channel Islands.'

"The rainfall exceeded the mean in 'Scotland, N. and W.,' and also in 'Ireland, N. ;' in 'Scotland, N.' the excess was very large. In all other parts of the Kingdom there was again a deficit, and in most of the English districts the fall was very slight.

"The bright sunshine was very little prevalent in the north and west, but a fair amount was recorded in most parts of England. The percentage of possible duration ranged from 61 in the 'Channel Islands,' to between 40 and 46 over eastern, southern, and south-western England, and to only 19 in 'Scotland, E.,' and 10 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, September 22.

MARKET quiet. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

POTATOS.

MARKETS remain dull, and prices low. At our railway Potato depots, stocks have been increasing. Best samples off bright soils, 60s. to 70s.; do., dark, 45s. to 55s. J. B. Thomas.

Obituary.

GEORGE BOND.—It is with regret that we have this week to record the death of Mr. George Bond of Clematis Cottage, Lydbury, North, Shropshire,

SEEDS.

LONDON: Sept. 21.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the supply of Trifolium is nearly as possible exhausted; for the insignificant quantity remaining, much higher quotations are obtained. As yet there is no business doing in Clover seeds. Winter Tares are in brisk request at full prices. Seed Rye continues good and cheap. The new Essex White Mustard realises high rates. Rape seed moves off slowly. With regard to Canary seed, the recent excitement has given place to a quieter feeling. Hemp seed and Buckwheat are without alteration. Linseed is steadier. Blue Peas meet a good inquiry.

FRUITS AND VEGETABLES.

BOROUGH: Sept. 20.—Quotations:—Cabbages, 2s. 6d. to 3s. 6d.; Marrows, 3s. 6d. to 4s. per tally; Cauliflowers, 1s. 6d. to 1s. 9d. per dozen; Lettuces, 6d. to 1s. per score; Carrots, 2s. 6d.; Turnips, 1s. 6d.; Parsley, 2s. per dozen bunches; English Onions, 4s. to 4s. 6d. per cwt.; Horseradish, English, 3s. 6d.; foreign do., 2s. per bundle; English Apples, 2s. 6d. to 3s. per bushel.

SPITALFIELDS: Sept. 20.—Quotations:—Cabbages, 2s. to 4s.; Marrows, 2s. 6d. to 3s. 6d.; Cauliflowers, 2s. 6d. to 5s. per tally; Spinach, 1s. 6d. to 3s.; Scarlet Beans, 2s. to 2s. 6d.; French do., 2s. to 2s. 6d.; Beetroots, 1s. 6d. to 2s. per bushel; Greens, 1s. 6d. to 1s. 9d.; Carrots, 1s. 6d. to 2s. 6d.; Onions, 1s. 9d. to 2s. 6d.; Parsley, 1s. to 1s. 6d. per dozen bunches; Spanish Onions, 4s. 6d. to 5s. 6d. per case; Dutch do., 2s. 9d. to 3s. 6d.; Belgian do., 2s. 9d. to 3s. 3d. per bag of 110lb.; Leeks, 1s. 6d. to 2s. 6d.; Endive, 6d. to 9d.; Cabbage Lettuces, 3d. to 4d. per dozen; Cos Lettuce, 4d. to 1s. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Mint, 1s. 6d. to 2s.; Horse Radish, 12s. to 14s. per dozen bundles; English Apples, 2s. to 4s. per bushel; Pears, 2s. to 3s. 6d.; Egg Plums, 3s. to 3s. 6d.; Victoria do., 3s. 6d. to 4s.; Damsons, 2s. to 2s. 6d.; Bullaces, 2s. to 2s. 3d.; Green Gages, 5s. to 6s. per half-sieve; English Tomatos, 3s. 6d. to 4s. 6d. per peck; foreign do., 6d. to 1s. 6d. per box.

STRATFORD, Sept. 21.—There has been a good supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 2s. to 4s. per tally; Scarlet Beans, 1s. to 2s. per sieve; 2s. to 4s. per bag; Cauliflowers, 1s. to 2s. per dozen; 4s. to 7s. 6d. per tally; Turnips, 1s. 6d. to 2s. per dozen bunches; 4s. to 4s. 5s. per ton. Carrots, household, 4s. to 5s. per ton; Mangolds, 17s. to 21s. per ton; Onions, Dutch, 3s. 6d. to 4s. per bag; do., Oporto, 6s. to 7s. 6d. per case; Apples, English, 2s. to 6s. 6d. per bushel; Plums, 1s. 7d. to 2s. per half-sieve; Damsons, 3s. to 3s. 3d. do.; Celery, 8d. to 1s. 1d. per roll; Pears, 3s. to 6s. per bushel.

FARRINGTON: Sept. 22.—Quotations:—Cabbage, pickling, 1s. 6d. per dozen; Beetroot, 2s. 6d. per bushel; Carrots, 2s. 6d. to 3s. per bag; Turnips, 2s. 6d. to 3s. do.; Marrows, 3s. per half-tally; frame Cucumbers, 1s. 3d. to 1s. 6d. per doz.; Apples, cooking, 2s. 6d. to 3s. per bushel; Golden Knobs, 6s. do.; Manx Collins, 3s. 6d. do.; Pears, Hazel, 6s. per bushel; Plums, 2s. per half-bushel; Damsons, 3s. do.; Grapes, Lisbon, 10s. per box; Tomatos, foreign, 2s. 6d. per box.

NOTICES TO CORRESPONDENTS.

* PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

APPLE TREE: J. P. H. If it be a bearing tree which has not been root-pruned or lifted since it was planted, it will be safer to first prepare it for removal. Cut a trench 3 feet away from the stem as deep as the bulk of the roots go, and 1½ feet wide; cut off all roots at the outer side of the trench, and lift very carefully all roots to within 2 feet of the stem. Shorten all of them a little, and remove all badly-bruised parts, and fill in the trench with good fresh soil, arranging the roots at various levels, and in straight lines diverging from the stem. If the tree is a large one it will be sufficient if one-half of the distance round the tree is finished this year, the remainder being completed in the autumn of 1893. It will be prudent to reduce the size of the head in any case by removing superfluous branches and weak shoots, and in case of a large head, the branches may be shortened by 2 or 3 feet. Apple trees of more than 12 years old on the free stock, if not prepared in the way described, are apt to become useless after removal, or die.

BLESTER ON VINE LEAVES: D. R. We adhere by our first reply in this column, and no leaves have reached us as yet.

BOOKS: L. R. Henfrey's *Elementary Course of Botany*. 4th Ed. John Van Voorst, Paternoster Row.—*British Flora*. 5th Ed. L. Reeve & Co., Henrietta Street, W.C.

CARNATION: T. Brothers. We do not recognise it. Send it to some grower of these plants.

COLCHICUM DECAISNET: W. E. G. We have never seen the plant so named.

GRAPES, &c.: C. T. We know of no case in which the manure with which the Vines and Peaches were dressed had affected the flavour of the fruit. We can believe that in your district a sooty flavour might be given to the fruit by the deposit of soot on it. It is a fact that glass roofs become almost opaque from this cause—in fact, nothing escapes. If the bunches before eating the Grapes, were washed with clean water applied with some degree of force with a garden syringe, most if not all, this deposit would disappear. The Grapes would be little the worse in appearance, but they should be hung up in an airy place before being sent to table. Peaches are eaten after the skin is removed, so that nothing more is required in the case of this fruit.

LEAVES OF CLOVEYNE CRISTATA: L. Delarue-Cardon. It is a fungoid growth that is now become rather common amongst Orchids. Sponging with weak Tobacco-water or Quassia-water will prevent much injury being done if applied soon after its appearance.

LILIUM NEILGHERRENSE: W. J. B. The same kind of treatment as that accorded to *L. lancifolium*, i.e., cultivation during winter, spring, and early summer in the greenhouse or under some kind of cover. Put the bulbs after the growths have ripened, one good-sized bulb in an 8-inch pot, or three in a 10-inch one, employing rotted cowdung, loam, coarse peat, and a small quantity of sand; let these ingredients be used in a roughish state; put the bulbs halfway down the pot, and just cover them with soil, the filling of the pot being done when the stems are 1½ foot high. Stand in a cool pit or greenhouse facing north, or even out of doors, screened behind a building from the sun, each pot being covered with a piece of slate to exclude rats and mice. On the approach of winter cover the pots with tree leaves to the depth of 1 foot. Part of the stock might be so treated, and part in the greenhouse or pit. It would give a succession of bloom. All greenhouse Lilies do well under leaves during their resting-period, the roots not being excited by warmth to form stems before winter is past. Be sure that the potting is firmly done, especially making sure that the Lily-bulb rests on a firm base. Old potsful of bulbs need not always be pulled apart, but they may be re-potted whole.

LILIUM HARKNII *syn.* *L. LONGIFLORUM* EXIMUM: W. J. B. It is a half-hardy species, but it will endure greenhouse treatment, and when in growth the heat of the intermediate house may be employed to hasten the time of flowering, although the flowers are not so enduring as when grown cool or out of doors; potting and soil the same as for *L. neilgherrense*. If the bulbs have been forced they might be turned into the borders after flowering—in the mass, or kept in pots till ripe, and then divided and planted, there to remain for one or two years, cutting off the blooms if the plants come up weakly. The deformity of the blooms may be due to insects. You should send us examples for inspection.

MARKET PRICES: W. J. B. Private grower's goods fetch low prices for several reasons. They do not arrive in time, or they are not packed in saleable packages, are not sorted into firsts, seconds, &c.; are not of even sample; or it is understood that they must be sold, and that whatever they fetch will be accepted by the senders. Until the private grower can be brought into touch with the consumer, so long will both be at the mercy of the middleman.

MEALY BUG IN THE CONSERVATORY: E. S. E. Some of the plants that have tender foliage may be washed with methylated spirits, in so far as the infested parts are concerned. The hard, woody stems of climbing plants, Camellias, &c., may be painted with a thick paint made of clay, soft-soap, flowers-of-sulphur, and a little nuxvomica; or use Gishurst soap, at the rate of 2 oz. to the gallon of water; if there be no leaves on the stems, 4 oz. may be used. Added to these remedies, fumigation with the new material, Nicotine will be of service.

NAMES OF FRUITS: C. H. Peaches: 1 and 2, Noblesse; 3, Grosse Migoonne; 4, Noblesse; 5, Fairchild's Early; 6, Bellegarde. Peaches cannot be named with any certainty in the absence of the leaves and flowers.—T. B. 1 and 11, Mank's Codlin; 2 and 6, Lord Grosvenor; 5, Kerry

Pippin; 8, King of the Pippins; 7, Red Quarrendon; 9, Lord Suffield; 12, Hanwell Souring.—J. Box. 1, Early Juliea, nearly rotten; 1, Irish Peach; 2, Mank's Codlin.—B. W. S. Next week.

NAMES OF PLANTS: S. Ely. *Epidendrum ciliare*.—G. M. C. *Epidendrum fragrans*.—W. L.—*Lælia crispata*.—Flowers. 1, *Hedyssarum coronarium*; 2, *Begonia Rex* variety; 3, *Selaginella lepidophylla*; 4, *Onychium japonicum*; 5, *Davallia* (*Leucostegia*) *immersa*; 6, *Adiantum cuneatum*.—C. F. *Camberley*. 8, *Lasiandra macrantha*; 2, *Vinca oculata alba*; 3, *Tydaea formosa*; 4, *Polystichum capense*; 5, *Blechnum braziliense*; 6, *Acalypha Macfeeana*.—H. J. R., *Florence*. *Stanhopea Wardii*.—St. Mary's Isle. 1, *Suaeda maritima*; 2, *Sonchus arvensis*; 3, *Epipactis latifolia*; 4, *Arenaria marina*; 5, *Veronica Beccabunga*; 6, *Filago germanica*; 7, withered beyond recognition; 8, *Atriplex patula*; 9, *A. rosea*. As the numbers were in some cases detached, we cannot be sure that they are correctly assigned. H. J. Co. *Staphylea pinnata*.—A. W. Uoripe fruit of some Quince like *Pyrus Maulei*; send leaves. W. C. R. *Yucca filifera*, with the curious horn-like processes on the margin, which are often found in this species. Number 7. 1, *Jasminum officinale*; 2, *Verbascum nigrum*; 3, *Eucomis punctata*; 4, *Agrostemma coronaria*, 5, *Escallonia macrantha*; 6, *Begonia Digswelliana*. J. D. A. *Gloriosa superba*.—G. F. 1. *Phytolacca decandra*; 2, *Maclura aurantiaca*, the Osage Orange; 3, *Diplopappus chrysophyllus*; 4, *Symphoricarpos racemosus variegatus*; 5, *Ananthus ilicifolius*; 6, *Spiraea Fortunei alba*.—J. M. 5, *Scolopendrium vulgare*; 26, *Asplenium trichomanes*; the others next week.—J. O. B. *Cratægus Aronia*.

PLUMS: R. Miller. Owing to inefficient packing, the fruits are unrecognisable.

PRONUNCIATION: Youth. Muscat, the u as in up; the second syllable as written. Gros Colman or Gros Colmar, as the French would pronounce the first word gro, the other word as written with a long o.

SEEDS OF ODONTOGLOSSUM CRISPUM AND O. TRIUMPHANS: S. E. B. Wait till next spring before removing the pods, then sow the seed (much of which will have no vitality) on the surface of the compost in which the mother plants are growing, and let it receive the same kind of treatment. If any should grow, let the plants remain undisturbed till a pair of true leaves are made, then put them into thimble pots.

SOILING OF SEEDS OF LILIIUM, IRIS, ANTHERICUM: S. E. B. Sow in finely-sifted sandy loam and peat, and cover the seeds with mould to the same depth as the lateral diameter of the same. Use well-drained deep pans, and keep in a cool pit or frost-proof frame away from direct sunlight, covering each pan with a piece of tile or slate. The pans if well watered when sown, will not require water oftener than once a month, perhaps seldom. See that the surface of the soil is kept free from mouldiness and moss. When germination takes place, put the pans where they get a certain amount of light, and in a week give them full exposure to it.

STACHYS: Enquirer. *Stachys affinis* and *S. tuberosa* are one and the same.

TOMATOS: C. P. The plants and fruits are attacked by *Cladosporium fulvum*. See *Gardeners' Chronicle*, p. 532, October 29, 1887. Burn every vestige of the diseased plants.

VIOLET: Subscriber. Seems to be the ordinary Russian Violet.

WILD CHEERY: N. J. C. The galls on the leaves are the work of a mite, probably a species of *Phytoptus*.

SAM DEARDS' PATENT SELF-WATERING SHELF FOR PLANTS ON SHELVES.

Now on view at Stand 11, Block A, Horticultural Exhibition, Earl's Court, S.W.
ITS ADVANTAGES ARE—
1st.—No waste of water, all water being absorbed by the plants.
2nd.—Saving of three-fourths of the labour in watering.
3rd.—The plants are watered more naturally than by any other method.
4th.—All drip and water dropping from shelves to plants beneath entirely prevented.
5th.—Not a drop of manure-water is lost, all being absorbed by the plants.
6th.—A boy can do the work of a man.
7th.—A row of plants 100 yards long can be watered without walking a yard to do it.

FIXED.

Full Particulars on application. Testimonials:—

From Mr. J. WILLARD, Head Gardener to the BARONESS BURDETT-COUTTS, Holly Lodge Gardens, Highgate, N., July 12, 1892.—"Dear Sirs, Having given your Improved Garden Gully a fair trial, I may say that it proves in use all that you claim for it, and in my opinion has, for the sides of walks and drives, many advantages over the ordinary grating. Perhaps the best proof I can give you of this is that, as opportunity offers, I intend to use them instead of gratings. Faithfully yours, J. WILLARD."—To Messrs. VINCE & VINE.

From W. WALTON, Esq., Secretary to the LONDON CEMETERY COMPANY, The London Cemetery Company, 29, New Bridge Street, Blackfriars, E.C., July 25, 1892.—"To Messrs. VINCE & VINE, Highgate. I am very happy to testify that your Patent Garden Gully-Frames in lieu of the old-fashioned gratings answer admirably. They were by my authority fixed in a new pathway made in Highgate Cemetery, and in the recent thunder-showers they were severely tested and were

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.; 15-in., 8s. (The larger sizes are very strong for carriage drives.)

most effectual in preventing the scouring of the gravel. At the inspection my Directors were much pleased with them, and gave instructions that they were to be used when required at Nunhead Cemetery.—I am, yours truly, W. WALTON, Secretary."

From Messrs. CUTBUSH AND SON, Highgate and Barnet Nurseries.—"Highgate Nurseries, London, July 27, 1892.—Dear Sirs,—Referring to the Improved Garden Gully you fixed for us some months ago, we are glad to say it answers admirably. As you are aware, our Nurseries here are very hilly, and during the recent storms all the ordinary gullies were blocked, whereas yours was in good working order. We shall not hesitate to recommend the same to anyone requiring the gullies for sides of paths and carriage-drives, and we feel certain, when it is known, there will be a great demand.—We are, yours faithfully, WM. CUTBUSH AND SON.—Messrs. VINCE & VINE."

If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale. Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by **POST-OFFICE MONEY ORDER.**

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

County of Salop.

LECTURER on HORTICULTURE.

THE TECHNICAL INSTRUCTION COMMITTEE are prepared to receive Applications for the Appointment of a LECTURER on HORTICULTURE. Applicants must have had practical experience in Gardening, but preference will be given to those who have paid special attention to the Culture of Fruit. The person appointed will be expected to devote the whole of his time to the duties of his office. The Salary will be from £150 to £200 per annum, according to qualifications. Applicants, in writing, stating age and qualifications, together with three recent testimonials, are to be sent to the ORGANISING SECRETARY, Shirehall, Shrewsbury, so that the same may be received by him not later than Saturday, October 8, 1892.

Just published, 8vo, pp. 565, price 7s. 6d. (6s. 3d. nett cash).
CONTRIBUTIONS TO HORTICULTURAL LITERATURE, from 1843 to 1892, by WM. PAUL, F.L.S. Published by WM. PAUL AND SON, Waltham Cross, Herts.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
 F. SANDER AND CO., St. Albans.

THOMAS BUTCHER can recommend several HEAD and UNDER GARDENERS of first-rate character and proved ability. Gentlemen seeking such may have particulars free.—Apply to THOMAS BUTCHER, Seed Merchant and Nurseryman, Croydon.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application.
 Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

GARDENER (HEAD); age 43, married, three children, youngest 10.—A. MILLER, for the last sixteen years Head Gardener at Rood Ashton, seeks re-engagement. For references, apply to W. H. Loog, Esq., Rood Ashton, Trowbridge.

GARDENER (HEAD); age 30.—The Right Hon. LORD RODNEY, Berrington Hall, Leominster, Herefordshire, wishes to recommend his Head Gardener to any Nobleman or Gentleman requiring the services of a thoroughly trained practical Gardener, well up in every department of his work.—Please address, first instance, J. GRIMES, as above.

GARDENER (HEAD); age 30; married when suited.—Mr. WARD, Riddings House, Alfreton, can with confidence recommend his Foreman, H. Huellischer, to any Lady or Gentleman requiring an efficient and competent Gardener; fifteen years' practical experience; eight years in present situation.

GARDENER (HEAD), where two or three are kept.—Age 30; well up in all branches; fifteen years' experience; first-class references.—A. B., Mrs. Cheer, Stroud Green Road, Shirley, Croydon, Surrey.

GARDENER (HEAD).—Married, no family; eighteen years' practical experience in all branches; good references.—J. BENNETT, The Gardens, Treberfydd Bwlch, K.S.O., Breconshire.

GARDENER (HEAD).—Age 34, married, no family; nineteen years' practical experience in all branches of the profession. First class testimonials.—C. SAVEGAR, West Hill House, Dartford.

GARDENER (HEAD), or GARDENER and STEWARD.—Age 44, married, no family at home; thoroughly understands the profession in all its branches. Nine years in last situation. Left through estate being sold. Shall be pleased to engage with any Lady or Gentleman requiring a thorough practical man.—A. TAYLOR, Ivy Cottage, Ballsalis, F.O.M.

GARDENER (HEAD).—Mr. R. C. WILLIAMS, Head Gardener to the Earl of Lisburne, Crosswood Park, Aberystwith, can confidently recommend a good Man as above. Twenty years' practical experience in first-class places; eight years as Head. Excellent testimonials. Distance no object.—Apply as above.

HOLLOWAY'S PILLS.—Good Digestion.—Holloway's Pills are universally acknowledged to be the safest, speediest, and best corrective for Indigestion; loss of appetite, acidity, flatulency, and nausea are a few of the inconveniences which are remedied with ease by these purifying Pills. They strike at the root of all abdominal ailments; they excite in the stomach a proper secretion of gastric juice, and regulate the action of the liver, promoting in that organ a copious supply of pure, wholesome bile, so necessary for digestion. These Pills remove all distention and obstruction, and from their harmless composition are peculiarly well adapted for delicate persons and young children; whilst casting out impurities these excellent Pills strengthen the system and give muscular tone.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

KEITH'S PATENT RAMS & HYDRAULIC RAM-PUMPS, Self-acting, For Raising Water.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS, For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

May be viewed. Catalogues may be obtained on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Worcester.

FIVE DAYS' ABSOLUTE CLEARANCE SALE of about 20 Acres of beautifully-grown NURSERY STOCK carefully prepared for removal, by order of Messrs. Richard Smith & Co., a portion of their land in the City boundary being required for Building purposes.

Important to Noblemen, Gentlemen, Landscape Gardeners, Nurserymen, and others engaged in Planting.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the St. John's Nurseries, Worcester, about 20 minutes' walk from the Worcester Railway Station, on MONDAY, October 17, and FOUR FOLLOWING DAYS, at 12 o'clock precisely each day, without reserve—

25,000 STANDARD and PYRAMID ORNAMENTAL TREES, 4 to 18 feet, in great variety; 2000 Prunus Pissardi; 3200 Purple Beech, best dark-leaved variety; 500 London Planes.

5000 FLOWERING SHRUBS in great variety. 12,000 SPECIMEN CONIFERS and EVERGREENS,

1 1/2 to 12 feet high; 2000 Portugal Laurels; 1600 Gold and Silver Variegated Hollies, standards and Pyramids; 2500 Golden Yews, grand plants.

Large quantities of fine Native LARCH, 2 to 4 feet. Ash, Quick, and other FOREST TREES.

Thousands of FRUIT TREES, including Standard and Pyramid Pears, hundreds of Stanlar Victoria Plums, grand trees; Standard and Pyramid Damsons, Standard and Pyramid Apples, Black and Red Currant, Waltham's Industry, Kespale, and other popular Gooseberries.

Several hundreds of fine Planting and Fruiting VINES. Forcing ASPARAGUS

Thousands of TEA and NOISETTE ROSES, in pots, embracing the most popular plants.

Thousands of CLIMBER, consisting of 10,000 Clematis Jackmanii, 1000 Clematis in variety.

Berried AUCUBAS, in quantity, and other Stock. Also 8 two-wheel TRUCKS, and 1 smaller do., suitable for Nurserymen and others.

The Auctioneers desire to call special attention to this highly important Sale. It is the first occasion on which an Auction has been held at these celebrated Nurseries, the necessity now arising solely on account of a portion of the ground having to be given up for building purposes; and the present Sale affords an exceptional opportunity to Noble men, Gentlemen, and others desirous of acquiring large quantities of well-grown Nursery Stock.

Purchasers may arrange with Messrs. Smith & Co. to have their lots lifted and forwarded at the cost of labour incurred and material used. Luncheon provided each day at 11.30.

The Stock may be viewed any day prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers, Estate Agents, and Valuers, 67 and 68 Cheapside, London, E.C.

Matlock Moor, Derbyshire

GREAT SALE OF RHODODENDRONS. MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. J. Mainell & Co to SELL by AUCTION, at their Branch Establishment, known as the Matlock Moor Nurseries, Matlock Bridge, 1 1/2 mile from Matlock Bridge Station, on WEDNESDAY, October 12, at 12 o'clock precisely, a portion of their extensive stock of TRANSPLANTED RHODODENDRONS,
